in the same varieties the good qualities of the Dawson's Golden Chaff and the Turkey Red varieties of winter wheat, the Herison Bearded and the Red Fife varieties of spring wheat, the Mandscheuri and the Two-rowed Chevalier varieties of barley, the common emmer and the red spelt, etc. Although there is a great difference of opinion at the present time as to the outcome of the recent investigations in plant-breeding, we believe, from what we have been able to observe from the work of others and from our own practical experience, that tremendous strides will be made along the line of plant improvement through artificial cross-fertilization within the next few years.

It will be seen from what has already been said, that the work of the improvement of our grain crops in its best form, means careful, systematic work conducted along definite lines and over a long period of time. This is brought about by first selecting the best seed from the best plants of the best varieties, to secure a foundation stock for crossing in order to obtain plants, eliminating as many of the poor qualities and incorporating as many of the best characteristics as can be brought together in any one variety to fulfil a certain and a definite purpose.

Alfalfa on Wheat-Ground.

I would like your advice about sowing alfalfa on a piece of wheat, by harrowing once before sowing and harrowing lightly after sowing. Do you think the wheat will smother it out? I intend to sow about ten acres, and sow 10 pounds of good seed to the acre. Please answer through the KANSAS FARMER.

CHAS. LEIPERSBERGER.

Riley County.

The seeds of alfalfa are small, and even though they may germinate fairly well, the vitality of the young plants is quite low; hence it is more essential that a proper seed-bed be prepared for grasses, alfalfa, and other crops which have small seeds than any of our other crops. I should not think that your field of wheat would be a proper seed-bed for the alfalfa, as it would be liable to crowd the young alfalfa plants too much. If your field was plowed last fall and put into a good physical condition, and if you will harrow the field and seed the alfalfa at once, and cut your wheat crop for hay, you might have fairly good conditions for your alfalfa. However, the wheat

does not appear to be as good for hay as some of our other crops, and I presume that it would not be advisable to seed the alfalfa in the wheat. When you seed a field to alfalfa you expect to let it remain for several years, and a thin or spotted stand is not at all satisfactory. If it is necessary to plow up such a stand, your seed has been wasted; so I would advise the seeding of alfalfa on a carefully prepared seed-bed, either very early in the spring or about September 15 if fall seeding is preferred.

V. M. SHOESMITH.

Japanese Millet—Turkestan Alfalfa.

I would like a little information in regard to Japanese millet. Will it do well in our dry climate? Where can I get the seed, and at what price? Would you consider Turkestan alfalfa better than common alfalfa on upland? Where can I get the seed and at what price? Please answer through your valuable paper.

GEORGE WORTH.

Rush County.

Although the Japanese millet is usually advertised in the seed catalogues as a very productive crop, it has not proved so at this station; in fact, the yields are so low that we have often not weighed the crop because it has been so small and contained so many weeds. Even if the seed germinates well, the plants do not thrive, and it is, according to our tests, not nearly so desirable a type of millet as the German, Hungarian, or Siberian. However, if you wish to seed a small plot of this millet, you can secure seed of any of the wholesale seed-firms in this or adjoining States. The seed costs about 10 cents per pound, or about \$3 per bushel.

The Turkestan alfalfa which was introduced by the U. S. Department of Agriculture from the Highland in Central Asia, is claimed to be a more hardy variety than the common alfalfa and better suited for growing under semi-arid conditions. The U. S. Department of Agriculture recommends this alfalfa as a desirable type; however, much of the alfalfa-seed advertised by our seed-houses as Turkestan alfalfa does not differ from the common variety.

At this station a plot of Turkestan alfalfa, the seed of which was purchased from one of our most reliable seed-firms, and which they claimed to have secured direct from Government importation, has grown successfully, but appears to be not different in yield, or any other respect, from the common alfalfa. Hence, I would suggest that if you try the Turkestan alfalfa you try it in a small way at first, unless good reliable seed can be secured as cheap as the common alfalfa. If you find that you have a more desirable type than the common variety, you can soon secure more seed for seeding larger fields.

Alfalfa on Prairie Sod.

I would like to get your opinion on seeding ten acres of prairie sod to alfalfa. The land is about half creek-bottom, the rest second-bottom. Would it do to break and then disk and work fine with the harrow and sow the seed? If so, would I be likely to get any crop from it this season, or would it be better to seed to millet and sow in the fall? It is usually dry here in the south part of Ellsworth County in the fall. If the millet is put in, can I get a good seed-bed by disking after the millet is taken off? I intend sowing rape for pigs on a lot that has never been plowed but the old sod is dead and the ground is excessively weedy. Can I clean off the weeds and get a seed-bed by disking, or would you recommend plowing? How early can rape be sown in Ellsworth County, and after the crop has been pastured, what crop can I put in to follow it for fall pasture? I find that by reading and following instructions in the "old reliable" KANSAS FARMER I am learning more about farming all the time. I am middle-aged in years, but young in farming. I would like to have my name placed on the mailing list for Experiment Station bulletins.

Rice County. J. J. HYSELL.

As alfalfa-seed is quite expensive and as the seeds are small and the young plants of low vitality, requiring a very thoroughly prepared seed-bed, your plan to break up prairie sod and seed to alfalfa the same season would be impracticable. The new soil to be broken up has a good amount of fertility for growing corn, Kafir corn, or other cultivated crops, and the field would be in a much better condition for sowing alfalfa after it had been cropped a few years. Your plan to sow millet and put the alfalfa in after the millet would be preferable to seeding the alfalfa at once upon new breaking; but it would be still better to seed another field to alfalfa

and plow this up, and in four or five years seed the field that you are about to break.

It is a little early yet for the seeding of rape, so that you will have time to plow your field and harrow it several times to firm it and put it in a good physical condition for seeding; and I think that this would be considerably better than simply disking the field, as I notice that it has never been plowed. Rape may be seeded almost any time from the first of April to the first of August, and if it is possible to divide your lot without much expense, it would be advisable to seed one-half of it about the first of April, and seed the remainder three or four weeks later, and then turn the stock from one lot to the other. If your stock have a large lot which is sufficient to furnish them with pasture, they are liable to allow some of the plants to grow too large, and will continue to eat on some of the newer growth of the others until they are destroyed. The rape may continue to grow and make a fair pasture until late in the fall. If it is mostly eaten off in the summer and does not produce much of a new growth, you may follow the rape by rye, cane or cow-peas for fall pasture, the preference for these depending largely upon your plans for cropping the field the next season, and also upon the nature of your soil. Soil which is inclined to blow or wash during the winter is better protected by a crop which will better survive the winter, such as rye. If you wish especially to increase the fertility of your soil in nitrogen content, the cow-peas would be preferred. These may be seeded broadcast, two bushels per acre; but on account of the cost of the seed, I presume that the rye would be as satisfactory to use for this purpose. V. M. SHOESMITH.

Yellow vs. White Corn.

Kindly inform me whether yellow or white corn is best adapted to this section of the State. Also quote prices on your seed-corn. THOS. DALY.

Bourbon County.

Good producing varieties of either white or yellow corn should succeed well in your section of the State. It appears that on upland soil many farmers prefer to grow a variety of white corn, while certain varieties of yellow corn are considered better adapted for bottom-land. I am of the opinion that this difference in adaptation, if there is any difference, may not be due to the color of the corn, but rather to the variety; for instance, we have found some varieties of yellow corn that were better adapted for growing on our light upland soil than were other varieties of white corn. In your section of the State, the Boone County White or McAuley's White Dent should succeed well.

Of the yellow dent varieties, the Hildreth, Kansas Sunflower, Legal Tender, and Reid's Yellow Dent corn may be successfully grown in your part of the State. If you prefer an early maturing corn, choose the Reid's Yellow Dent, or if a late maturing corn is preferable, the Hildreth or Kansas Sunflower may be recommended. I have mailed a copy of a letter giving some information regarding varieties of seed-corn, with the addresses of the growers. Our supply of seed-corn is practically exhausted.

A. M. TENEYCK.

Pasture.

EDITOR KANSAS FARMER:—In reply to J. N. Hunter, I sowed about ten years ago for pasture, 3 pounds white clover, one bushel Kentucky blue-grass to the acre on cornstalk land, disked and harrowed in March. The freezing and thawing covered the seed. It came up early in the spring and has been a good pasture for hogs and cattle. Crab-grass does not bother this grass as it makes a thick sod. Two years ago I sowed twenty-five bushels of English blue-grass. It came up all right and I commenced to pasture about the first of July. I had a good pasture until frost came. I waited the next spring for my English blue-grass as I wanted the pasture early. I am still waiting and looking. The crab-grass killed out the English blue-grass. I sowed the Kentucky blue-grass and now have a good pasture. N. B. SAWYER.

Montgomery County.

As long as it is grievous to thee to suffer, and thou desirest to escape, so long shalt thou be ill at ease, and the desire of escaping tribulation shall follow thee everywhere.—Thomas a Kempis.

Tranquility of mind will often pilot us through many choppy places.

**WE HAVE ON HAND NOW A FINE SELECTION OF
IMPORTED**

Draft Stallions and Mares

Ranging in ages from 2 to coming 5-year-olds, and weighing from 1600 to 2000 pounds, of the following breeds:

PERCHERONS Blacks, Greys and Bays

ROYAL BELGIANS Bays, Roans and Chestnuts with White Manes and Tails

ENGLISH SHIRES Bays and Brown

OLDENBURG COACH Blacks, Bays and Chestnuts

Eight Imported Percheron Mares

If you are looking for something good enough to win in any show-ring, we guarantee to show them to you.

One pair of 4- and 5-year-old gray mares, weighing 4000 pounds, both heavy in foal to one of the most famous stallions in France; one pair of matched black 3-year-old mares, weight 3500 pounds, one of them has black filly colt at foot, and the other one will drop a colt within six weeks; one 2-year-old black mare, weight 1,700 pounds, of extraordinary bone and finish; one pair of dark gray yearling mares, weight 3000 pounds, will certainly make a show team; one 2-year-old dark gray mare, very smooth and one that will please you.

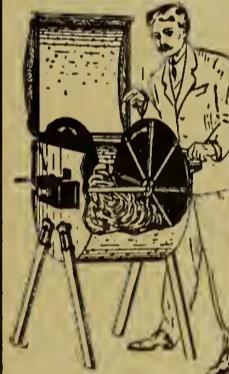

Every one of these mares are absolutely sound, and of the most fashionable blood that the old country produces. The prices range on them from \$500 to \$1,000, colts at foot not counted. This is an exact description of them, and we guarantee the mares to please anybody looking for good ones.

Do not write, but get on the first train and come and buy them.

We sell first class stallions as cheap as they can be bought anywhere, and give with them a 60 per cent guarantee, and furnish life insurance if desired. TRY US ONCE.

Barn Plans and Outbuildings

New, revised and greatly enlarged edition,
Modernized and brought up-to-date

EDITED BY EDWIN C. POWELL

A reliable guide to those intending to build new barns or to remodel old farm buildings for any and all purposes.

The proper and economical erection of barns and outbuildings requires far more forethought and planning than was ordinarily given to their construction. But with modern ideas, proper appreciation of sanitary conditions, and the use of labor-saving implements, a barn that twenty-five years ago was considered perfect would not meet present requirements.

Outline of Contents:

After an introductory chapter on the general rules to be observed in barn building, special chapters give detailed information and illustrations on

GENERAL FARM BARN
CATTLE BARN AND STABLE
DRAFT BARN
CATTLE SHEDS
BEEF BARN AND SHED
PIGGERY
POULTRY HOUSE
CARRIAGE HOUSES AND HORSE BARN
CORN HOUSES AND CRIBS
ICE HOUSE

DAIRY HOUSE
CREAMERY AND CHEESE FACTORIES
BREEDING HOUSES
GOAT SHEDS
SMOKER HOUSES
DOG KENNELS
BILGS
ROOT CELLARS AND ROOT HOUSES
BUTCHERS OF VARIOUS KINDS, ETC., ETC.

All descriptions and directions contained in this volume are given in so plain and clear a manner as to be readily understood by anyone. Every professional builder, and every person, be he farmer or otherwise, who intends to erect a farm building of any kind, can, in this book, secure a wealth of designs and plans for a very small sum.

With 375 illustrations, 6 x 7 inches, 404 pages.

Cloth, price, postpaid, \$1.00

THE KANSAS FARMER CO.

TOPEKA, KANSAS

THE NATIONAL DAIRY SHOW.

(Continued from page 305.)

made butter direct from sweet cream, but which failed because of lack of market for this quality of product. The successful appearance of the radiator on the market would seem to indicate an advanced step in butter-making, though the ultimate result of its appearance is hard to predict.

The National Dairy Show was a wonderful exhibition. Wonderful because of its size, its success, and, more than all, its comprehensiveness. No implement, accessory, or novelty known to the trade was omitted from the exhibits. Every process by which milk is prepared for consumption in bulk, as cream, condensed milk, butter or cheese, was shown in its completeness. In this building the visitor could take his journey from the cow-stable, where the modern methods of sanitation, the feeding of balanced rations, the care of the animals, and the workings of the milking-machine were shown, clear through every operation to the butter-cutter and the automatic scale which delivered the butter to the customer, weighed accurately to the fraction of an ounce, or to the counter where the canned and bottled milk were ready for delivery for the use of the infant or the invalid.

Among the dairy-stable appliances were stock foods, stalls, watering troughs, scales, stanchions, milk-pails and cans, in bewildering array. In addition, there were manure-spreaders, corn-shellers, silage-machinery, and grinders which are accessory to good dairy-farming. There were also various forms of power, including the tread power, gasoline, kerosene, and steam engines, electric- and water-motors. And then the farm telephones, filters, roofing materials, etc., found an appropriate place as accessories on the modern and up-to-date dairy farm. There were also automatic bottle-washers, bottles and bottling-machinery, milk-wagons, butter-colors, boxes and packages, cultures, extracts, sterilizing and pasteurizing machines without limit.

A part of the space in this great building was devoted to the pure-food show. This was made with the cooperation of the Department of Agriculture at Washington. Dr. Wiley, Chemist of this Department, sent an exhibit that was a revelation to most visitors and made each feel sorry for his stomach. This exhibit included the chemical apparatus used in detecting the adulterations in food and drink, and a very large exhibit of adulterations that had been extracted from foods and drinks bought on the open market. One of the most startling features of this exhibit was the samples of cloth stained in brilliant colors with coloring matter extracted from foods and drinks that are daily sold in the open market.

There was a hospital exhibit in which a demonstration was given of the methods of preparing foods for invalid infants. Nearby was a cooking-school exhibit of great interest, while a little farther down the line was an exhibit made by the United States Army commissary department, in which was shown a complete collection of the prepared food-rations provided for use of the soldiers when in the camp, the fort, or on the march. A camp kitchen was in daily use and luncheon was served to invited guests at noon. Those who were fortunate enough to receive invitations were unanimous in their statements that Uncle Sam's soldiers are well-cared for in the matter of food.

In connection with this great show was held the National Creamery Butter-Makers' Association meeting. This meeting was very largely attended, much larger than ever before. Indeed, it furnished the opportunity for the show, but the latter proved such a success that we venture the prediction that hereafter the show will furnish the opportunity for the Butter-Makers' convention. There was held also at this time, the National Dairy Farmers' convention, which had a large attendance from many different States and from Canada, and the last convention of the week was the Pure-Food convention which was also largely attended. These meetings were held in the large hall over the Annex where the cattle were stabled.

It is significant that the United States Department of Agriculture and the agricultural colleges of several States gave such large assistance in making this show a success. The agricultural colleges of Kansas, Missouri, Illinois, Indiana, Ohio, Pennsylvania, Nebraska, Minnesota, New York, and Guelph, Ont., were all represented by professors in charge, a number of whom contributed valuable papers to

the meetings and did everything in their power to add to the interest of the occasion. Kansas did herself proud by sending fifteen students from Professor Erf's Dairy Husbandry Department of the Agricultural College as well as Professor Erf himself, who read a valuable paper at the meeting.

The great objection to dairying as a life business and the one which, more than any other, prevents many farmers from engaging in it, is the necessity for milking the cows by hand and the difficulty of obtaining the right kind of help. It has been the dream of inventors for years that some kind of a milking-machine could be made which would remove this objection to the most profitable branch of agriculture. Milking-machines have been in use for several years but they seem not to have arrived at perfection and their use has not become general. In one corner of the cow-stable in the Annex of the Coliseum, was shown the latest milking-machines in daily operation. This machine seemed to do its work well and to the comfort of the cows. During the week a newly-calved Guernsey heifer was milked quietly and with apparent comfort by this machine while attempts to milk her by hand had been resented by vigorous kicks. This machine is operated by the application of power to a pump which compresses the air and draws the milk from the udder. The only objection that could be raised to the machine lies, not in its work, but in the difficulty of keeping it clean. Long rubber tubes connect the suction cups which surround the teats, to a central receptacle and it is possible to milk a number of cows at the same time with one machine. If this machine can be kept thoroughly clean, it would seem that a very long step in advance has been made for the dairy industry. One dairyman of Wisconsin was so pleased with the machine and its operations that he ordered ten of them for use in his home dairy.

In spite of the small accommodations available in the Annex, and in spite of the fact that none of the breeders' record associations gave financial assistance to the show, except only the Holstein-Friesian Association, the cattle show was a success. Cattle were shown from Canada to Kansas, though some of those who made entries were prevented from shipping by reason of sickness. The show was so successful that it is sure to be continued.

The success of this show as a whole has induced the management to change the name from The National Dairy Show to The International Dairy and Food Show. This change was induced more perhaps by the exhibits of dairy cattle from Canada and by the wonderful exhibit of pure food shown by the Department of Agriculture and other exhibitors, than by any other reason.

One of the interesting features of the show was a large booth fitted up in very attractive style by Swift & Company in which was shown milk-fed chickens, both alive and dressed, ready for shipping. A capable cook was in attendance who fried these chickens from time to time and gave the visitors samples. Visitors were unanimous in pronouncing the flavor excellent and different from anything before tasted.

Taken altogether, the National Dairy Show was a wonder. It was interesting to the city people as well as to those from the dairy farms. It was a straight business exhibition with no frills or spectacular features. The booths were nicely decorated and the general view of the large Coliseum was attractive, but each exhibit was specially arranged for its educational value and not for mere entertainment or amusement. The city man and woman in attendance had open to them a new world about which they may have read, but of which they could know little or nothing by observation or experience.

It is a matter of pride that the establishment and the successful issue of this initial dairy show, were due entirely to the efforts of two Kansas men, Mr. James A. Walker and Mr. W. W. Marple, were president and vice-president respectively, and to them and them only, is due the wonderful success of this wonderful exhibition. Both these gentlemen are well known to Kansas people by reason of their connection with the Blue Valley Creamery Company, formerly of Marysville, Kans., but now of St. Joseph and Chicago. Their energy, ability and money made the show possible, and to them is due all praise.

PEERLESS CREAM SEPARATORS

Reasons Why the PEERLESS is the best

FIRST—Twice the capacity of any other bowl. That is to say two times smaller than any other bowl of equal capacity.

SECOND—Compound feature, two bowls in one, hollow bowl and disk bowl combining all the features of the tubular and disk machines.

THIRD—Enclosed frame. Free from dust. Injury resulting from machine impossible.

FOURTH—Perfectly noiseless.

FIFTH—Heavy enough and strong enough to lift a box-car, which insures durability.

SIXTH—The bushings made of phosphor bronze—the most serviceable material for the purpose. Fitted and guaranteed to be accurate to $\frac{1}{2}$ of 1-1000 of an inch.

SEVENTH—Every journal bushed with brass or phosphor bronze. This fact together with the fine adjustment described above, accounts for the light draft of the PEERLESS machine. Each busing is made in duplicate and interchangeable and if at any time they show wear they can be replaced at a small cost.

EIGHTH—At normal temperature the skimmed milk will always show less than 5-100 of 1 per cent butter fat and generally less than 1-100 of 1 per cent butter fat. PEERLESS CREAM SEPARATORS are guaranteed to anybody—everybody, anywhere—everywhere.

TOPEKA BUSINESS COLLEGE, TOPEKA, KAN.

train over the Santa Fe Route from Atchison, Kans., to Superior, Neb., are made more manifest. Nearly 4,000 farmers were enabled to hear the lectures which were given by men of State and National reputation. For nineteen years the Kansas Dairy Association has held annual meetings in different cities of the State, but was never successful in drawing together any considerable number of farmers. It is estimated by those in a position to know, that the number of farmers who attended the meetings on the special dairy train, was greater than the total number brought together in all of the eighteen preceding annual meetings of this Association. It is also stated on the highest possible authority, that the number of farmers in attendance upon these lectures on the train, was larger than the total number brought together by the annual meetings of the dairy associations of Michigan, Wisconsin, Iowa, Illinois, Indiana, Missouri, and Nebraska, combined.

The idea of the dairy train was conceived by Secretary I. D. Graham, and its success was due to his forethought and careful management, backed as he was by the Santa Fe Railway Company.

A report of the proceedings of the dairy train, together with the resolutions adopted at the annual meeting at Abilene on Saturday after the termination of the trip, were published in the KANSAS FARMER of March 8. We now take pleasure in presenting our readers with synopses of the lectures delivered on that train. These will appear as fast as space will permit.

Why You Should Dairy.

Address by W. W. Marple, of Chicago, delivered at various points on the route of the Kansas State Dairy Association Special Dairy Train over the Santa Fe Route, Feb. 27 to March 3, 1906.

It is certainly a privilege to talk to you on a subject that is of such vital importance and one in which I am so deeply interested.

You are certainly to be congratulated on living in a community through which a railroad runs, operated by a corporation sufficiently interested in the development of the resources and in the people who live along its line, to come to them with a fund of information such as they have on this occasion.

You are to be congratulated on living in a state where there is a state institution such as you have at Manhattan, and where the officials of that wonderful institution are so much interested in the development of agriculture throughout the state.

It is of very great importance to the man who is contemplating some line, as to why he should dairy. There are a number of reasons, all of which are feasible and true. It is a difficult matter to decide which one of these reasons is the strongest and most important. A very strong reason, and probably the most attractive, is that it pays more than any other branch of agriculture. The reason that it pays is that it forces into use an element in our make-up that is most valuable; it compels us to use a force that we have that brings the highest price under all circumstances; it gives us an opportunity for using our mentality and it is this element in our make-up that, when placed on the market, brings the highest price. A man may have a collegiate education; he may be an artist of renown; he may be thoroughly posted on all the arts and sciences and yet be only worth about a dollar a day for digging a ditch.

Whenever he engages in any line or pursuit that gives him an opportunity to use his brain, he puts himself in a position to realize the greatest returns for his efforts.

The young man who has been dissatisfied on the farm in other lines, finds this business attractive because it not only returns to him speedy results, but returns them in cash. Under other circumstances, he has been forced to wait a full year to know what he has realized and whether he is going to realize anything for his labor and his time and his effort. In dairying, he gets immediate results; if he is advised to use a certain feed for his dairy, he can tell in forty-eight hours whether that advice is good or not, while if he is advised to use a certain kind of seed for the production of a certain kind of grain, he has to wait a year before he knows whether his advice was good.

It is possible for him to increase the results from his dairy by carrying out certain plans and adopting certain rules and he gets this increase right away. There is no limit to what he is able to accomplish through the influence of a system brought about by the exercise of his mind force. He can keep books, he can balance his accounts every day the same as a bank, and with these

opportunities, the business continues to grow more fascinating, and where once he hated the humdrum life on the farm, it becomes attractive to him and he is disposed to remain there.

I really do not know that it is necessary that any other reason should be given as to why we should dairy, but there are others and in the few minutes that have to talk to you, I want to enumerate some of them.

There is probably nothing we are so much interested as our own homes. In the busy, active walks of life we are glad to retire to the seclusion of our home, let it be ever so humble, and it is there that we get our satisfaction and perfect rest. We are interested in beautifying and adorning these homes and making them as attractive as possible. While our special interest is in our own home, in a general way we are interested in all the homes in the country in which we live. A man travelling over the country in a balloon, if dropped down blindfolded and his blindfold removed, if in a dairy country, would recognize it as such at once. The general appearance of the country, including the good houses, good roads, good barns, kept-up fences, and all those things which add to the beauty of a rural district, are evidenced, and the cause is plain. There is every inducement in the dairy country to do this. 'Tis not only true, but the highest state of cultivation exists there. The productiveness of the dairy farm is far in excess of that of any other. This is a very prominent reason why we should dairy.

I believe that we have no more right to take from the soil its fertility and leave it in a depleted condition for the next generation, than we have to take the oxygen from the air that we expect them to breathe, and in consequence, make it impossible for them to live any length of time. The land that we occupy, while we may have a deed to it, is not ours; it is only loaned to us, and it will be transferred to someone else when we are through with it, and that will be in a comparatively short space of time, and it should be the one object of our lives to turn that over to our children in as good condition as we found it. It would be an utter impossibility to do this were we to continue to raise grain year after year. There is no other business in which you can engage that can bring about this effectually but dairying.

There are many reasons why we should dairy but none why we should not.

The placards that are hung around this car are full of wisdom. There is one that says:

"A carload of corn is worth \$250. A carload of butter is worth \$5,000. Convert your corn into butter and save the freight on 19 cars."

The manufacturer studies economy and adopts those means by which he can produce the finished product and get it to the consumer for the least amount of money. There is no question but that to reduce corn to butter is decidedly the cheapest method of getting the product of your farm to the highest priced market.

There is another placard which says: "The dairyman leaves his children a better farm than he got. The grain raiser does not."

This is true. A man at Marshfield, Mo., bought a farm at \$5 an acre. This had been cultivated in grain for years and produced an average of about 15 bushels of corn an acre and about 6 bushels of wheat. He has had this farm ten years and has done extensive dairying. Last year his corn crop was an average of 75 bushels to the acre and his wheat crop 25 bushels. His farm is worth at least \$30 an acre and this result and these conditions are brought about by the manner of business that he has engaged in. He has been returning to the earth the fertility that it has been robbed of for years.

In conclusion, to sum up the reasons why we should dairy: it is pleasant business; it is profitable business; it is an attractive business to those who are engaged in it; it makes better farms more attractive homes; a more fascinating country and a better people.

Why We Should Dairy.

Address by Hon. Ed. H. Webster, Chief of Dairy Division, Bureau of Animal Industry, United States Department of Agriculture, on the Kansas State Dairy Association Special Dairy Train over the Santa Fe Route, Feb. 27 to March 3, 1906.

There are a number of important reasons why the Kansas farmer should engage in the dairy business. The first among these is the natural adaptability of the country to dairying. Few sections furnish such an abundance of cheap feed as can be produced on Kansas farms, and few can grow the feeds

WORLD'S BEST BUTTER

DE LAVAL SEPARATOR TRIUMPH AT NATIONAL DAIRY SHOW

The great DAIRY SHOW and NATIONAL BUTTER-MAKERS' CONVENTION held at CHICAGO, February 15th to 24th, awarded ALL HIGHEST BUTTER PRIZES to entries made from DE LAVAL SEPARATOR CREAM, the prizes and the scores being as follows:

GRAND PRIZE—GOLD MEDAL

A. CARLSON, Rush City, Minn. Score 97

SILVER MEDAL

J. E. HOWE, Oakland, Minn. Score 96½

SILVER CUPS

E. J. SIMONSON, Milton, Wis.	Score 96
W. H. BECHTEL, Caro, Mich.	Score 96
LOUIS NIELSON, Camp Point, Ill.	Score 96
F. L. ODELL, Greenfield, Iowa.	Score 95½

Out of the total 610 butter entries 559 were DE LAVAL users, the other 51 representing the users of all other separators combined, while of the 496 entries scoring 90 and over, 463 were DE LAVAL made, the other 33 covering all competitive users together.

All this is in keeping with what has happened at every previous Convention Contest of the National Buttermakers' Association since its organization in 1892, all highest awards having been made, without exception, to DE LAVAL users.

While in evidence of the recognition of DE LAVAL superiority by the best buttermakers everywhere, it is important to note that the proportion of DE LAVAL made entries has never been less than 85 per cent, and at the present Great Show was over 91 per cent of the total number.

A DE LAVAL catalogue, gladly sent for the asking, will help to make plain WHY under like conditions DE LAVAL cream produces butter superior to that which can be made in any other way. Write for it to-day.

ing the soil, builds it up. It adds nitrogen and humus to the soil, and although large crops can be removed from two to four times a year the soil gradually becomes richer in these elements. A dairy farm will gradually become richer year by year, while a neighboring farm on which is grown wheat or corn to be sold from the place, will in time become so exhausted that these crops will not pay.

Another reason why dairying should be of interest to every farmer, is that by converting the crops grown on the farm into the finished product, an added profit can be obtained. The dairyman of the East and of the South has practically to feed crops worth from two to four times per unit value of the same crops on Kansas farms, and yet these crops can be fed to dairy animals profitably, and butter sold in the same markets in which the Kansas product finds its outlet. The farmer who grows alfalfa and corn and ships it East to the dairymen, allows that dairyman to have the profit derived from manufacturing this cheap product into a finished article. The Kansas farmer should think of this and convert all such crops, possible into the finished product on his own farm.

Another reason why dairying will more and more appeal to the Kansas

farmer is that land is appreciating in value and methods of farming must be found that will pay the interest on the investment. Land is bound to increase in value as the years go by. The public lands have been exhausted and the young man of to-day must buy a farm and pay a good round price for it. He must of necessity follow different methods of farming than were followed by his father who homesteaded 160 acres in the early settlement of the State. In countries where land is very much higher than it is in the United States, dairying has been found to be one of the most profitable industries on such lands. The farmers of Denmark, Northern Germany and the Islands of Guernsey and Jersey are valued at \$500 to \$2000 per acre, and dairying is practically the only business that can be entered into on a large scale, which is profitable on such a high-priced land. In our own country the high priced lands of Iowa, Illinois, and Wisconsin are almost invariably dairy sections of those States. The famous Mohawk Valley in New York is world-renowned as a dairy section. In this valley, lands are very high in value. One can go only a few miles from this valley and find the abandoned farms of the East. These farms are abandoned because dairying was not a feature of agriculture on them. Thus it is worth while for the Kansas farmer to consider that with the constant increasing value of his lands, means must be taken to rearrange his farming operations in such a way that he can make not only a living, but will be laying up something for a rainy day on the investment which he finds himself the possessor of.

Another encouraging feature in dairying is the fact that it brings in a constant, steady income. The farmer who raises hay or grain or feeds cattle has but one period of income during the year, and he must arrange his work accordingly. He can never tell at the beginning of a year what his income for that year will probably be. Adverse climatic conditions may come and crops may fail; the cattle market may go down and apparent profits be turned into loss. But with a good dairy herd on his farm he is assured of an income at least once a month, and in many cases oftener than this, throughout the entire year. This enables him to regulate his expenditures according to his income, and keeps him out of debt.

One of the features which is encouraging about the dairy business is that the presence of a dairy herd on the farm does not necessarily mean that the farmer shall stop growing wheat or corn, or any other crop, for sale, but dairying fits in nicely with these occupations and insures a steady working income to carry them on. In cases of this kind when crops fail, the farmer still has his living, and if he has a wisely-selected herd, more than a living.

The occupation of dairying gives constant employment throughout the year to labor. This to some farmers is an objection to business, but if they would view the matter in the light that any business man would a proposition of this kind, they would readily see that steady employment is the only means by which the most value can be obtained for the labor employed. The hired man who works three months or six months of the year and then has to seek another place or another occupation for the balance of the year, is

never as good a hired man as the one who can be assured twelve months steady work at a fair income. The merchant or other business man who would try to run his business on principles that seem to prevail among many farmers, would find himself bankrupt at the end of the year. He from necessity must stay by his business every working day of the year. As land and labor become higher in price, the farmer will see that he must follow a similar method in the management of his own affairs and so regulate his farm operations that he can give labor constant employment throughout the year, and use it in such a way that it will be profitable to him.

The last reason I wish to mention why dairying should be of importance to the Kansas farmer is that it requires a better man to be a dairyman than to follow almost any other line of agricultural pursuit. When the farmer secures for himself a herd of cows and begins to study their needs and the kind of crops to grow, the kind of stock to own and how to feed this stock in order to get the maximum amount of milk; when he begins to study the selection of animals, to eliminate the poor members from his herd and to study how best he can market his products, he is engaged in a business that is going to make him a broader man in every way; he becomes a more intelligent and better citizen in the community in which he lives. One has but to look over the general condition of things in our own country to see that this is practically a matter of fact. In localities where some single crop has been for generations the one mainstay of the farm, one does not find the high grade of intelligence among the farmers as he does where the farmer has engaged in some branch of the live-stock industry, and I believe that it can be said without contradiction that the better developed dairy sections of our country are also better developed along other lines; they stand for better things in political and social life; they have better homes and are educating their children to become better citizens.

For these reasons and others that I have given you, it seems to me that the Kansas farmer should carefully consider the question of dairying as one of the important industries that should engage his attention.

Why the Kansas Farmer Should Dairy.

Delivered by Prof. E. W. Curtis, Kansas City, on the Kansas State Dairy Association Special Dairy Train.

There are two classes of farmers in Kansas to whom these remarks can be addressed: The farmer who is handling beef cattle, keeping his cows for the purpose of raising the calf, and the grain farmer.

Speaking to the former class, it is well that we take account stock of just where we are in the cattle-raising business. It is wise in any line of business, for us to stop occasionally, inventory, and figure out our profits and losses.

The Kansas farmer who keeps a cow a year for a calf, must figure about as follows: If he hires it done anywhere in the State, it will cost him \$8 to winter a cow. It will cost him on an average of \$3 to summer her. The interest on the money invested in the cow is at least \$2. He will average through blackleg or other causes at least 10 per cent losses on calves after they are born, which figures at about \$1.50. Not over 80 per cent of the cows will calve each year on an average, which figured out will increase the cost of keeping his herd at least \$2 per head, which makes a total cost to keep a cow one year \$16.50. These are actual and fixed charges and he is not taking into consideration the fact that year by year the cow is growing older and less valuable.

We would like to ask any farmer how much he received for calves last fall, or how much those calves would be worth, should he want to sell them. He will tell you that steer calves were worth on an average of \$15; and the heifer calves on an average of \$12 and we believe it is very conservative figuring indeed, to say that the average calf in Kansas was worth last fall not to exceed \$13.00.

Many stockmen will tell you these figures are entirely too high. Accepting them as true, however, it shows that the Kansas farmer who is keeping cows for their calves, is losing at least \$3 per head; and we know thousands of Kansas farmers who are keeping a bunch of cows year after year and wondering why the cattle business is not profitable.

Speaking now to the Kansas grain farmer, we want to call your attention to a series of reasons as to why dairying would be more profitable.

(1) Dairying will take less fertility

from the soil than any other class of farming. We believe every farmer in the State wants to deliver his farm to his children as rich in fertility and as valuable in productive power as it was when he first began farming it. We especially desire to call your attention to the amount of fertility you are taking from the soil if you are raising any of the following crops:

Wheat	8.63
Corn	6.80
Oats	7.88
Sorghum or Kafir-corn grain	5.94
Hay	6.00
Cream	1.00
Butter	.50

Figures furnished by the Department of Chemistry, Kansas State Agricultural College, Manhattan, Kans.

In other words, you are taking \$8.63 worth of fertility from the soil in every ton of wheat which you haul away. This ton of wheat will sell for less than \$20, whereas, a ton of butter selling for \$500, takes but 50 cents worth of fertility from the soil.

(2) Cream and butter are condensed products. Nothing can be made or grown on the farm which brings as much per pound. Farms remote from market, and communities far from railroads, can send their butter to market, or their cream to the creamery with the least possible expense. Hardly any other farm products can be loaded a hundred to a thousand dollars worth at a time, upon a wagon, and drawn to a shipping point so readily as can butter. The dairymen can condense tons of fodder and crops grown on the farm into dairy products, and send them to market in a compact and portable form.

(3) Butter is a finished product. It is made ready for the consumer, either in the private dairy, or the cream can be shipped to the large creamery concerns, who can probably manufacture it more economically than on the farm.

Much that is produced on the farm is raw material, and must be manufactured or otherwise prepared for use after leaving the farm.

(4) Dairying brings in a constant income. The man who sells crops of any kind has to wait until he can market his products once a year. There is little satisfaction in this. It is unbusinesslike to go without cash fifty-one weeks of the year and then have a lot of money come in at one time. The dairyman has an income nearly fifty-two weeks in a year.

(5) Dairying gives constant remunerative employment. The grain or potato grower must spend a large part of the year in enforced and demoralizing idleness, but the dairyman finds profitable work throughout the year, and his work is most profitable in the winter time.

(6) On the dairy farm the work is better divided. The grain harvest comes so close to haying that it often gets mixed up with it to the detriment of both; but where corn is grown and put into the soil for dairy feed, and not so much or no grain raised, the harvests are several weeks apart. Then in winter dairying, there is a let up in the dairy work at the busiest season of the year on the farm, while the dairy needs the most work when other farm-work is lightest.

(7) Skill and brain work get better pay in dairying than in any other branch of farming. To produce fine dairy products requires something besides hard work. The dairyman must have knowledge and skill of dairying. These are required in breeding and feeding dairy cows, and in handling dairy products. And the care bestowed and the skill exercised pay better in hard cash, than they do in other branches of farming.

(8) There is more room at the top, greater opportunity to improve than in any other farm-work. Cows produce from 150 to 500 pounds of butter per year, and the butter sells from 10 cents to one dollar per pound. No other branch of agriculture shows anything like this or gives such a chance to rise.

(9) Taking the country through, there is no kind of farm-work so well suited to women and children as dairying.

(10) Dairying leads to thoughtfulness for the comfort of animals, and thus tends to morality. There is something demoralizing about horses. Men who work in horse stables are rough as a rule, but cows have an opposite influence. To do her best, the cow must be made as comfortable as possible in every way. She will tolerate no neglect or cruelty. She is a teacher of gentleness and kindness.

(11) Dairying is the most progressive branch of farming. Some of the changes for the better that ten years have brought, are the Babcock test, the improvements in separators, etc.

(12) Dairying pays better than any other branch of farming, both actually

HOSPITALS CROWDED

MAJORITY OF PATIENTS WOMEN

Mrs. Pinkham's Advice Saves Many From this Sad and Costly Experience.

It is a sad but certain fact that every year brings an increase in the number of operations performed upon women in our hospitals. More than three-fourths of the patients lying on those snow-white beds are women and girls who are awaiting or recovering from operations made necessary by neglect.

Every one of these patients had plenty of warning in that bearing down feeling, pain at the left or right of the abdomen, nervous exhaustion, pain in the small of the back, pelvic catarrh, dizziness, flatulence, displacements or irregularities. All of these symptoms are indications of an unhealthy condition of the female organs, and if not heeded the trouble may make headway until the penalty has to be paid by a dangerous operation, and a lifetime of impaired usefulness at best, while in many cases the results are fatal.

Miss Luella Adams, of Seattle, Wash., writes:

Dear Mrs. Pinkham:-

"About two years ago I was a great sufferer from a severe female trouble, pains and headaches. The doctor prescribed for me and finally told me that I had a tumor and must undergo an operation if I wanted to get well. I felt that this was my death warrant, but I spent hundreds of dollars for medical help, but the tumor kept growing. Fortunately I corresponded with an aunt in the New England States, and she advised me to take Lydia E. Pinkham's Vegetable Compound, as it was said to cure tumors. I did so and immediately began to improve in health, and I was entirely cured, the tumor disappearing entirely, without an operation. I wish every suffering woman would try this great preparation."

Just as surely as Miss Adams was cured of the troubles enumerated in her letter, just so surely will Lydia E. Pinkham's Vegetable Compound cure other women who suffer from female troubles, inflammation, kidney troubles, nervous excitability or nervous prostration.

Mrs. Pinkham invites all young women who are ill to write her for free advice. She is daughter-in-law of Lydia E. Pinkham and for twenty-five years has been advising sick women free of charge. Address, Lynn, Mass.

and prospectively. Look at the prices of farm products. The prospect is poor for many products, but butter is high in all markets.

There is no business which holds out more inducements to the young people on the farm. It is adapted to a wider area of country than any other agricultural pursuit. Noxious and fungus diseases cause less injury to grass, alfalfa and corn than any other farm crops, and these three are the great dairy foods. The future to the skillful dairyman is full of promise and hope.

With such facts as these before him, I think the farmer who is puzzled to make both ends meet at present, must get down and do some hard thinking. One of the first things that strikes many, is that such a profitable branch of business must soon be overdone. If he was in possession of all the facts, however, he would not think so. There is a greater unfilled demand for butter to-day, than there was ten years ago, and this, notwithstanding the fact that butter is higher now than at that time and many times as much of it is made. The supply grows fast, but the demand grows faster.

Families who formerly used one pound, now use three in the same length of time, and those who ate almost none, now have discovered that it is a cheaper and better food for young and old than meat.

The fact is right here in a nutshell, that any farmer who takes up dairying for a business, and follows it intelligently, using the best tools and implements for his work, will have profitable, prosperous, continuing business so long as he may follow it.

Some Points in the Selection of a Modern Dairy Cow.

Delivered by Prof. Oscar Erf, Chief Dairy Department, Kansas State Agricultural College, on the Kansas State Dairy Association Special Dairy Train.

A modern dairy cow as she exists is artificial. She is to a large extent the creation of man's hand. She is the triumph of mind over matter, and, such being the case, there is a natural tendency in the modern cow to retrograde. In the breeding of live stock there is no such thing as standing still. We either progress or we go backward. Therefore, it is necessary that we must breed to an ideal and have the proper knowledge of what this ideal should be.

It is probably best that we take up some points of what should indicate the modern dairy cow. There are many who claim that the broad forehead and the large eye are indicative of large nervous force, but we have found that some of the modern dairy cows with a straight, long head have as good nervous force as those having great, broad foreheads. But I have never yet found a cow with a small nasal organ and a small jaw, that was a good eater. Since man develops her for the purpose of turning food into milk, it is quite essential that she be a good eater, and a good eater is almost universally found in a cow with a large, strong jaw.

I like a cow with a long, slim neck, which is known as a "ewe" neck, one that drops down and comes up about her withers. A fine, thin neck is as a rule an indication that the cow will not put fat on her back, which on the market is worth from three to five cents a pound, but rather convert the feed into hutter-fat in the pail, which is worth from 18 to 30 cents a pound. A short, jumbled-up neck generally indicates, if the cow is from a large milk-producing family, a large flow of milk at flush, but when she is far along in lactation the feed will go onto her back.

When we find a cow that slopes down from her shoulders and down from her legs-taking her from her withers and looking backwards toward her belly-and widens out into a wedge shape, it indicates a continuous flow of milk.

We must bear in mind that the ordinary cow in the country is a robber. She robs her owner during the last four months of lactation, of the profit that she has made in the first six months. This is particularly true of the Kansas cow. The right kind of a cow is one that will pay her way after she has been milked for six months. The average cow of Kansas produces a little less than 100 pounds of fat per year. It requires about 175 pounds to pay for the care and feed of the cow. There are a great many cows that produce from 200 to 300, and even 400 pounds of fat per year. Such cows become exceedingly profitable, but the great problem with the average farmer is to find these particular animals. I know there are many farmers who do not keep records of their cows, that will point with great pride to the fact that this cow gives 20 to 30 quarts of

milk, or even 40 quarts of milk at flush. I do not care anything about this. The point I want to know is whether this cow will in a year give six, eight, or ten thousand pounds of milk. We do not keep our cows for what they give us in their flush.

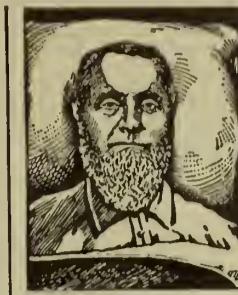

The large flow of milk is generally attended with a large expense of production. The profitable cow is a cow that is persistent in giving a large flow of good, rich milk. That is the cow that we all want to look for, and that is the cow that we want to own. Now, what I am attempting to describe, as I have said, is not the cow that at flush gives a large flow of milk, but the cow that shows by the year's record the largest flow of milk. I am not attempting to go into the question of how much fat this milk contains. There is no indication known to science or to practical methods to show what the fat in the milk will be. This is more or less of a breed characteristic, which is the nearest indication that we can reach. There are some well-known breeds that have a fairly large percentage of fat in the milk. For me or for any other man to describe what constitutes or what indicates by the appearance of the cow that she gives rich milk would be ridiculous. The best way to determine this is by means of the Babcock test. This machine will determine the richness of the milk, the real money value, no matter whether the cow has a rich colored yellow ear with soft skin, or whether she has a rough hide with thick skin, and I have observed cows with this latter characteristic that produced extremely rich milk.

The cow should have a large abdomen. The abdomen is the god of the cow. It is the place where the feed is converted into blood, which finally is made into milk. Take a cow with a great, deep abdomen, and it is presumed that she has the capacity to take her feed and turn it into milk. Never buy a long, lank cow with no belly. She is a fraud and a delusion. The cow that has the habit of turning her food into milk throughout the year will have a long, deep, wedge-shaped paunch.

The udder is another important point of which one should take due notice, and it is somewhat deceiving. The udder should be large and full. I believe that the greatest mistake that we make to-day in judging dairy cows, is to judge them with full udders. I believe that it is a legitimate plan to judge the full udder and then turn the cow away to be milked, and then again examine the udder to determine whether soft or flabby, or if it is fat, and base the conclusion on this fact that a good udder must shrink to a great extent.

Taking all things into consideration, select the cow that has thin withers, ewe neck, high hip bones spread wide apart, wedge-shaped pot belly, the pot belly being especially essential, and you will have a fine dairy cow. Examine her flow of milk and the milk vein. The younger the cow is the less is her milk vein developed; the older she is the more it is developed. I do not like a long-legged cow. Do not select a cow that has a habit of putting fat on her back. You want a machine, and you want to educate that machine to do your work. It is not within the power of man to make that machine do its work properly in one generation. It must be a matter of continuous breeding to fix a given habit in the cow. Some one might ask, "How are you going to do that?" "I do not possess these high-priced thoroughbred cows. I am not fixed on my farm to maintain the thoroughbred cow." Now I will say to the man who can not put into his herd the thoroughbred breeds, buy a thoroughbred bull. It matters not if it is a Jersey to supply butter, a Guernsey to supply the rich-colored milk, an Ayrshire to give a good flow of milk, or the Holstein to give a large flow, get a thoroughbred bull. Never pick one that is scrubby because he can not with any surety fix the blood or type.

As was stated first, the modern dairy cow is artificial. The bull that comes from this modern dairy cow is artificial. There is a natural tendency of the bovine race of all breeds to revert to their ancestors. There is always a tendency to go back, which naturally complies with the law of correlation, and for this reason we want to use nothing but thoroughbred bulls. Many people believe that because an animal is registered there is a guarantee that he is the sort of a bull to use, but this is a false idea. Unfortunately, with due respect to the herd-registers of this country, the fact of registration guarantees nothing but purity, except

in cases where the special, authentic record-register is put in, which has been established within the past few years with a few of the leading breeds. This is one of the best things that could be accomplished in connection with the herd-register of each individual breed. No animal is recorded in this registry unless he possesses a superior individuality. An animal from this herd-register means something; and the longer this work is carried on the more valuable it becomes. Take for instance, an illustration. The Isle of Jersey is a little island which is 6 miles wide and 15 miles long. The English people have agents on this island buying all the best cattle each year, and we have men in this country who go to the Isle of Jersey and buy the best that can be found. Understand that the island is depleted year after year, but they replenish the stock and as a rule they continue to improve in the quality of individuals. Why? I think there are two answers to this. One is the ability of the man to breed such cattle. He is a man of heredity. It is a mistake and it is a misfortune in breeding live stock that the son does not succeed the father. In the Isle of Jersey there are families who for generations have been breeders of Jerseys. They have profited by the experience of their forefathers and they keep clear of the pitfalls that their ancestors fell into. The second, and I believe I can not put too much emphasis on it, is that they will not admit into their herd-register any animal that does not possess superior individuality. Therefore, it follows that when an animal is recorded in the herd-book, the fact of registration guarantees more than the purity of the blood. It guarantees the superiority of the individual. Hence, if I wanted a bull to-day to use in a thoroughbred herd, I would not buy him unless I knew his ancestors back three or four or even five generations. Breed him to your best cows, raise the calves, and develop them into cows. Select the best and weed out the poor ones by means of a record of performance which is made by the Babcock test and the scales.

How We Should Dairy.

Address by T. A. Borman, Continental Creamery Co., on Kansas State Dairy Association Special Dairy Train.

The farmer who is producing dairy products is engaged in a manufacturing enterprise just as is the man who makes cream-separators or wagons. It is a notable fact that manufacturers spend a great deal of time and money in keeping a system of records which will enable them to know the exact cost of production, and when this is known, no expense is spared to procure the most efficient help or improved machinery by which they may be able to reduce the cost of the article manufactured. Now since we are operating a cow machine for the manufacture of butter-fat, is it not reasonable that we consider what a pound of butter-fat is costing us? Are we producing this butter-fat at a profit? If only at a small profit how are we to increase that profit? These are pertinent questions and bring us face to face with the conditions we desire to consider.

We Kansas farmers are producing butter-fat under the most favorable conditions. To the left of this train yonder is an alfalfa-field which appears to have yielded luxuriously. To the right is a stalk-field which indicates that Indian corn grows abundantly. On yonder slope the grass is taking on the green of spring. To-day, the sun shines bright and warm. Indeed we are located in a section unexcelled for producing a maximum yield of milk at minimum cost. Our climate is mild; our command are the best and cheapest milk-producing feeds on earth.

lands. We have at our doors the best creameries in the world bidding for our butter-fat. Competition in the purchase of butter-fat is so close these days that we are assured of the full value for all dairy products sold. We could not possibly be better situated than we are. Conditions, aside from the actual feeding and care of the cow which matter rests with the farmer himself, could not be improved. It appears to us as though all the forces of nature had conspired in favoring the very highest development of the dairy industry in this very spot.

Granting that our surroundings are favorable to the production of dairy products at a profit and that the markets afford an adequate value for the product, there are other factors at all times absolutely essential to successful dairying. Successful dairying is the kind which puts dollars in our pockets and is the only kind of dairying we can afford to consider. Those factors are the man, cow and feed.

The man who will make dairying the most profitable is he who will make a study of all the details in the manufacture of butter-fat as does the man who builds hand separators. By this we do not mean that he must spend years in college, although college training will make a man a better dairyman than if he had not had that training. There are no mysteries surrounding the dairy business which should cause the farmer to feel himself not capable of mastering. There is a plain, common-sense reason for every act in the proper feeding and care of the dairy cow. The farmer who would succeed must read, study and observe sufficiently to know what is good dairy practice. There is money and plenty of it in the dairy business for the farmer who will diligently and conscientiously study the cow and her needs. The difference between good and poor dairymen, as between good and poor lawyers, is in proportion to the study and brain power exerted. Unless we determine to improve as we progress, the future has no reward greater than that of the present.

The first essential step toward increased profits is to know what each cow of the herd is producing, and whether or not any cows of the herd are kept at a loss. My observation and experience, as a dairyman and careful student of dairy practice, shows that fully one-half of the cows milked in Kansas are kept at an actual loss to the owner, if these cows were charged market prices for the feed consumed. Fortunately, however, for us, we are able to be very liberal indeed with our cows, because of the fact that they convert into cash large quantities of roughage which does not have a market value and which would go to waste did the cow not consume it. Yet, we must know approximately what it costs to feed a cow and know what are the returns, to furnish a starting point in the improvement of the herd. It is estimated that the average Kansas cow, handled for dairy purposes, is producing probably 100 pounds of butter-fat per year. We have records of a large number of Kansas herds which are producing from 200 to 300 pounds of fat per cow per year. It is doubtful if the cow producing 100 pounds of fat per year is returning her owner a profit for feed and labor, if the cost of each were carefully figured. It is apparent though that the 200 pound cow with butter-fat selling at an average of 23 cents, as was paid by a big Kansas creamery last year, is quite profitable, and the 300 pound cow is a gold mine. In the case of the good as compared with the poor cow, the cost of labor, stabling, taxes, and feed is practically the same. We recall figures of a herd of 20 cows in which the best 5 cows produced an average of 350 pounds of butter-fat per year at a cost per cow for feed of \$17, the feed charged at farm prices, while the five poorest cows in the herd produced only 120 pounds of butter-fat at a cost for feed of \$12. The average of the five best cows was 230 pounds of butter-fat in excess of the average of the five poorest, and the cost of feed was only \$5 greater than of the poor cows. Briefly, this illustrates the difference in herds and cows. I am sure no farmer wants to milk poor cows if he can get good ones. These figures illustrate the fact also, that we have among our common cows many which are most excellent dairy animals, therefore, the improvement of our herds is very largely a matter of selection.

To know the relative value of each cow in the herd, we know of no better plan than the weighing and testing of each cow's milk. This is not such a big job as many farmers think. A pair of spring balances at a cost of 25 cents hung at a convenient place in

the barn and the milk from each cow each night and morning weighed and recorded for a period of three or four days during each of the twelve months of the year, will suffice. A sample of each milking during each weighing period should be taken and this sample either tested on the farm with a Babcock tester, which will cost the farmer \$4 or, the samples delivered to your cream receiving station where the operator can test each cow's sample, will be equally satisfactory. A record of this account kept for each cow, for each month during the year, will give the approximate return of each cow in butter-fat for the year. While the figures given will not be absolutely correct, they will be approximately so and will give the relative position which each cow has in the herd. From this record will be seen which are the cows producing the largest quantity of butter-fat; and we assure every farmer who tries this plan that he will not only be well repaid for his labor and effort so expended, but will be greatly surprised at the showing made by some of the cows which he may have considered as his best cows. There is no reason why the farmer should not try this plan of determining the relative value of his cows. There is no other way known to us by which he can get at the facts other than the plan described. If I should give you any other more simple or reliable plan than this, I certainly would do so.

It will be apparent from the results obtained by a careful test after this plan, that there are cows in almost every herd which are charging their owners three or four times as much money per pound butter-fat as other cows in the same herd. Some of these cows, which charge the largest amount for the butter-fat they produce, will be found very expensive animals to keep. We have found in herds, cows producing butter-fat at as low a cost as 8 cents per pound while the poorest cows in the herd will be charging anywhere from 20 to 25 cents. It is apparent, therefore, that the cow producing butter-fat at a cost of 8 cents per pound is a highly profitable animal, while those charging 20 to 25 cents per pound are running their owners in debt at each milking.

With the scales and test applied to each cow in the herd, we are able to know where we can begin the work of selection. We can, without the slightest hesitancy in the world, so far as injuring our profits from the dairy is concerned, turn into the feed-lot the poorest cows which, we believe, will be in the average herd about one-third of the entire number, and if careful check is made of the returns from the remaining two-thirds, it is our opinion that the farmer will be realizing fully as much money from the milking of two-thirds as many cows as he is milking at the present time. It is a disgrace to the intelligence of our sons, wives and daughters to ask them to milk an old cow which is not returning a profit on the feed and labor. After we have selected the best cows, we should introduce into the herd some butter-fat producing blood, and this can be done either through the use of a male animal from some one of the best dairy breeds or through a common male animal from some cow which is known to be a good milker. We can never grade up our dairy herds by the use of male animals which have been bred for years and years along beef lines. Let us save the heifer calves from the best cows and if the heifers are properly fed and reared from calfhood, they will be cows capable of producing larger quantities of butter-fat than their mothers. We believe it possible to raise heifer calves from our best common cows and a cross of some pronounced dairy strain, which will be at maturity twice as good as their mothers. We are confident that by the proper selection of a male animal it will be possible to eliminate all chances of rearing heifer calves which will not be profitable producers. It is our personal opinion that the grade Holstein cow is the best farmers' cow.

No difference how careful we may be in the selection of cows, unless we feed and handle these cows properly we will be disappointed in the results. Butter-fat is produced only from feed consumed. It requires a certain amount of feed to support the animal body. Everything the cow consumes over and above the feed necessary to support the animal body should, if the cow is properly selected for the dairy, go into the milkpail in the shape of butter-fat. It is necessary, therefore, for a maximum production of dairy products, that we give our cows all the feed they will consume. There is a difference in feed, too. There are cows so fed that they

ON THE LOOKOUT FOR A STEVENS FIREARM

so is your boy. Don't disappoint your boy, and your boy won't disappoint the hawk, should he come looking for trouble around your chicken yard.

If your dealer can't supply you, we send direct, express prepaid, any Stevens shotgun rifle or pistol, on receipt of catalogue price.

The greatest variety of Stevens shot-guns, rifles and pistols that can be seen. It tells how to choose a rifle, test it, sight it and protect it. Sent free for two 2-cent stamps.

keep in good flesh, but which, so far as milk-production is concerned, are absolutely starved to death. This is the reason why we get no milk or milk of little consequence when our cows are fed exclusively on corn-fodder, prairie grass or sorghum. These feeds, alone, do not contain the proper constituents for producing a large volume of milk. We must know how to feed a balanced ration. It is not necessary that we know technically all about a balanced ration. In this country the best balanced ration we can feed is typified in the use of alfalfa hay and corn chop. These feeds will grow on almost every farm in Kansas, and they are the cheapest and best milk-producing feeds on earth. When alfalfa can not be supplied to the cows in liberal quantities, we are compelled to feed prairie hay, and Kafir-corn or some similar roughage, to supply the protein, which is the chief constituent of alfalfa hay, in the shape of some other feed. Most commonly this feed is bran or cottonseed or linseed meal. We do not believe the average farmer is justified in feeding these expensive feed-stuffs. He should, if he is going to make the most money out of his dairy, by all means supply his cows with all the alfalfa they need. We must have a succulence in our feeds. Alfalfa hay is succulent. It comes nearer being June grass than any other dry feed at our command.

We should not overlook the fact that the crop of corn stalks which each year goes to waste on every farm would, if put into a silo, give us an almost indispensable feed in the dairy. We have gone to the expense of planting and cultivating and producing a crop of corn. In the fall we go through the field and take out the ears and leave on the ground fully thirty percent of the total value of that crop. Substantial silos can be erected at a cost of less than \$1 for each ton capacity. Green corn can be put in the silo at a cost of 50 to 75 cents per ton at the most. Thirty pounds of green, succulent corn-silage makes a day's feed for a cow. Ten acres of average good corn in the shape of ensilage will feed 10 cows from grass in the fall to grass in the spring. Tell me, if you please, how it is possible for us to secure any cheaper feed than this, which in the shape of corn stalks we are now allowing to go to waste on our farms? Tell me, if you please, what building we can erect on our farm for the protection of our grain at any lower cost than the first cost of a silo? The matter of ensilage in this country is a very important one which we have overlooked. Everybody knows that the cow produces the most milk on grass in the month of June. If we are to have a big flow of winter milk, we must supply her with winter feed which comes as near as possible to meeting the requirements of grass. In alfalfa and ensilage we have these feeds.

Let us have our cows come fresh in the fall of the year. During the six or seven months of fall and winter, butter-fat sells at a much higher price than during the spring and summer months. Let us produce butter-fat when it will bring the best price. The full-fresh cow, properly fed and housed, gives a good flow during the fall and winter, and when grass comes in the spring she again increases that flow.

The Grange in Cowley County.

Arkansas City Grange No. 1432, held its regular meeting in Arkansas City. During the evening the annual installation of officers was held. The Pleasant Valley Grange No. 1416, located at Hackney, Cowley County, was invited to attend and aid in the performance of this beautiful ceremony. The weather being fine, both granges attended in large numbers and the meeting was pronounced by all to be a grand success. After the installation ceremony was completed, Arkansas City Grange served an oyster supper which was followed by a literary program.

We hold our regular meetings on the first and third Saturdays of each month, and confer degrees in the first month of each quarter. At the close of conferring the fourth degree, a banquet is served.

At each meeting some question is presented and discussed, two or more being appointed to lead in the discussion, the other members of the grange expressing their opinions impromptu. Some of the questions that have been proposed for discussion are, "Why should Arbor day be observed?" "Why do we favor National aid for the improvement of the public highways?" and other questions of a similar nature. We have also taken up and discussed the question of the removal of the internal revenue tax of \$2.08 per gallon on alcohol denaturallized, or rendered unfit for use as a beverage, for commercial purposes, and after a discussion of this question at length, resolutions were drawn up and adopted favorable to the removal of the tax, which were sent to our legislative committee, and others who represent us in Congress.

SOPHIA DIEBLE, Secretary.

Tell Us How to Create an Interest in Our Grange.

You can not long hold a grange together by introducing outsiders, one after another, to lecture night after night. No matter how entertaining these lectures may be, the interest must come chiefly from within and must consist mainly in securing some work, or a suitable exercise from nearly or quite every member. The grange is a school for the mutual improvement of every one of its members; and to aid in securing this, it is usually a good plan to elect new officers at least every two years. This plan will interest and educate more. As far as the office of secretary is concerned, the practice suggested is condemned in some States on the ground that some persons are peculiarly fitted for that office and should be retained. The plan adopted by Manhattan Grange, in Riley County, in printing a program at the commencement of the year, and assigning the subjects at that time, is a builder of interest. For the young people, try spelling contests, charades, tableaux, dialogues, dramas, singing, etc. This question of how to create an interest in the grange is a hard one to answer, and nearly every grange must be a law unto itself. The lecturer should be the leader in this matter, and when you find a lecturer fitted for this purpose, keep him. The greatest problem in average subordinate granges to-day, and upon the solution of which, more than anything else, depends the future welfare and success of the order is, how to fairly and properly adjust the balance between the entertainment and educational features of the program. The claims of each

must be duly recognized or failure is certain. The young and light-minded must be made to realize that there is earnest work before them in the world, and that the Grange, properly conducted, is one of the most effective instruments for fitting them for their part in the world's work; while the more mature and serious minded should not forget that sociability, recreation and amusement are essential to the fullest development of human power. Mutual forbearance, concession and cooperation must be conceded to the end that the golden mean be attained.

Scraps of old, worn chamois skin strung on twine, bead fashion, and then tied into a "chamois ball," will last for years and polish glass as nothing else will do.

The Patrons' Cooperative Bank Building in Olathe is completed and furnished and is now occupied. It is conceded to be the best finished and furnished bank building in Eastern Kansas, and the granges of Johnson County feel very proud of it.

The Grange is growing in Coffey County rapidly. Five granges were organized in that county from August, 1905, to January, 1906. New members are being added to these granges constantly, and deep interest is manifested.

Kansas Boys' Corn-Growing Contest in Marion County.

WANTED:—Five hundred Marion County boys to enter this great corn-growing contest.

The Kansas State Agricultural College, through the Farmers' Institute Department, announces a corn-growing contest for Kansas boys. The Institute Department will plan for farmers' institutes to be held between October 15 and December 15 in all counties where contests are held. All local corn-judging will be done by members of the institute staff or by judges selected by the college.

Ten prizes will be awarded in each county contest on exhibits of ten ears in each entry. The Marion County Institute will award prizes as follows: For the best ten ears \$15; second best, \$10; the other eight prizes will be \$6, \$5, \$4, \$3, \$2.50, \$2, \$1.50, \$1, according to rank.

The contest will be limited to farmers' boys between twelve and eighteen years of age. The work must be conducted on a farm, not on a city lot. Each boy will be supplied by the committee with two quarts of seed and must agree to plant it carefully, cultivate it well, and exhibit twenty-five ears of corn raised from that seed, at the county institute and corn contest. With his entry he must submit a brief statement as to date of plowing the ground, kind of land, length of cropping history, methods of preparing for planting, method and date of planting, methods of cultivation, date of gathering his samples, and a statement of number of mature stalks in plot on the first day of August, the number of ears, and the number of barren stalks. Each boy must further agree to attend, if at all possible, at least one session of the county institute.

Of each twenty-five ears, ten will be selected to enter the contest. The entire twenty-five ears to become the property of the institute—the proceeds from the sale of this to form part of the prize fund. Provided—the prize-winners who desire to enter the State contest may retain their best ten ears for the purpose.

All the winners in the county contests will be eligible to enter the State contest—at which the capital prize will be \$100. This contest will be at the Kansas State Agricultural College on January 1 and 2, 1907, under the auspices of the Kansas Corn-Breeders' Association and the Agricultural College. Boys who win in the county contest will be allowed to bring or send the same ears exhibited there, or they may bring a new selection, but from the product of the same seed-corn given out by the committee in the spring for the contest.

Boys in Marion County who desire to enter this contest will send written application to the committee or secretary, stating their preference for white or yellow seed-corn. The seed will be delivered at some convenient point near and the applicant notified. Boys should make application as soon as possible, so as not to be disappointed about receiving seed in March or April. The committee must know how much seed to provide.

(Signed) O. Jolliffe, president; C. F. Stone, vice-president; E. A. Rood, secretary and treasurer, Route 2, Pen body, Kans.; R. Kent, T. L. Furst, R. Kieler, executive committee.

Tool Tests

Keen Kutter Tools stand every test of a good tool. You can take a Keen Kutter Hand Saw, bend the end of the blade around until it touches the handle and it will spring back straight and true. Every other kind of a Keen Kutter Tool is as good a tool of its class as the Keen Kutter Hand Saw. The Keen Kutter brand covers a complete line of tools, and every

KEEN KUTTER

Tool is made of the finest steel and made in the best possible manner by expert workmen. This quality tells in actual use—it means freedom from constant sharpening—it means long and satisfactory service. Even in the beginning Keen Kutter Tools cost little more than inferior qualities—in the end they are by far the cheapest tools you can buy. Keen Kutter Tools have been Standard of America for 36 years and were awarded the Grand Prize at the St. Louis Exposition.

Following are a few kinds of Keen Kutter Tools, which your dealer should have—if he hasn't them, write us and learn where to get them. Axes, Adzes, Hammers, Hatchets, Chisels, Screw Drivers, Auger Bits, Files, Planes, Draw Knives, Saws, Tool Cabinets, Scythes, Hay Knives, Grass Hooks, Brush Hooks, Corn Knives, Eye Hoes, Trowels, Pruning Shears, Tinner's Snips, Scissors, Shears, Hair Clippers, Horse Shears, Razors, etc., and Knives of all kinds. Every Keen Kutter Tool is sold under this Mark and Motto: "The Recollection of Quality Remains Long After the Price is Forgotten." Trade Mark Registered.

SIMMONS HARDWARE CO., St. Louis, U. S. A., 298 Broadway, New York.

Real Fence Economy

consists of getting the greatest possible fence value for the money expended. We offer you the best fence value obtainable and here is why we can do it.

We Sell Direct from Factory to the user of the fence. Thus we avoid all unnecessary and expensive handling and storing and cut out all profits and commissions of go-betweens. This makes a large saving. It enables us to spend more for good material and proper construction.

The Continuous Stay is what gives Advance Fence its superior strength. In Advance Fence the stay is never cut but runs continuously up and down across the fence for many rods without an end. Thus we preserve and utilize all the strength of the wire about half of which is wasted in fences with cut stays. Our method of construction costs a little more but it's worth while.

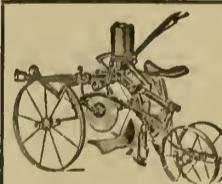

30 Days' Free Trial. Place your order with us for what fence you need and if after examining it you do not like it you can return it at our expense and get your money back. Don't you think this is a fair offer?

We Prepay Freight and guarantee safe delivery.

CONDUCTED BY RUTH COWGILL.

"The End Crowned All."

Afar in an old cathedral,
A beautiful window stands;
It is made from the useless fragments
That fell from the master's hands.
As he fashioned the other windows
With the art none knew so well,
Nor heeded the humble workman
Who gathered the bits that fell,
And carefully smoothed and polished
The atoms of glass so small,
Though some were dark and blemished.
He used them one and all.
He set them in wondrous pattern,
Each where it shone the best,
And his window, sun-illuminated,
Surpassed, by far, the rest.

From the moments that God has given,
We must make life's windows fair,
But the hues are dull and cheerless
In our seasons of sad despair.
Yet with infinite faith and patience
We can mold those darkened hours
Till they show in the whole mosaic
Only the forms of flowers,
And when, our lifework finished,
God sends his light divine,
In full transcendent glory
Those somber tints will shine.

—A. W.

Observance of Legal Holidays.

As some differences of opinion seem to have arisen relative to the observance of legal holidays, I will add these few lines.

When the legislators of our country set apart Thanksgiving Day, Washington's Birthday, Arbor Day, etc. as legal holidays, they intended that they should be observed as such. What is meant by the observance of legal holidays? Does it mean that on such days school is to be dismissed; the children to go home to spend the day in idleness and mischief; the teacher to spend the day as she thinks best, knowing she will receive her money the same as if she had earned it? It does not. The holidays were each set apart for a specific purpose. Washington's Birthday to learn more about "The Father of His Country;" Christmas Day to commemorate the birthday of our blessed Savior; Thanksgiving Day to give thanks to God for his manifold blessings. Let the teachers all over our broad land prepare literary programs for such days. Let the program consist of songs, recitations, and select readings appropriate to the day, the teachers, pupils, and parents all taking an active part.

A day thus spent will prove a blessing not only to the school but to the whole neighborhood, and the teacher will have the satisfaction of knowing that she has not only earned her money, but that she has been instrumental in bringing before the minds of the people the real object of a holiday.

EDITH MAY KERR.

Stockton, Kansas.

Fruits and Nuts.

There is a new theory for health which possibly goes to the extreme as most new fads do. It is that of uncooked foods. It maintains that cooked foods are dead, and that dead things can not make life. But however that may be, there are many uncooked foods that are healthful and pleasant to taste, that ought to be used more freely. Nuts and fruits have never been fully appreciated as a food, by the masses, but have been used between meals and at bedtime when food was not required, and consequently often caused indigestion; hence they were thought to be unwholesome. In an article on the subject of fruit as food, W. C. Barry says:

"In spite of all the opportunities and advantages we possess, and the cheapness of fruit, how many families fail to enjoy nature's food and nature's cure for many of the ills which afflict humanity. Our preference seems to be to experiment with drugs and to employ remedies which offer only temporary relief at best."

"We have yet to learn the full value of fruit as food. We should cultivate a taste for it, enjoy it, and derive the benefit from its health-giving properties. Every day in the year fruit of some kind should find its way to our tables, not merely as a part of the menu, but obtainable at all times, presented attractively and temptingly if you will, so that it may be partaken of easily and frequently. There are many, perhaps, who have never acquired a taste for fruit and who have little regard for it. To all those we can safely say that they are missing much, and for health's sake, they can not afford to dispense with it."

One can not think of a farm without its orchard and bushes of small fruits. Time is well spent, and space is far from wasted when used for such purposes, especially for an apple-orchard.

The crop is not always sure in Kansas, but what crop is? It is profitable, however. Let me quote from John Burroughs, the naturalist:

"The apple-orchard is sure to bear you several crops besides the apple. There is the crop of sweet and tender reminiscences dating from childhood and spanning the seasons from May to October, and making the orchard a sort of outlying part of the household. You have played there as a child, mused there as a youth and lover, strolled there as a thoughtful and sad-eyed man. Your father, perhaps, planted the trees, or reared them from the seed, and you yourself have formed and grafted them, till every separate tree has a peculiar history and meaning to your mind. Then there is the never-failing crop of birds—robins, finches, king-birds, orioles, red-birds, starlings, and others, such a crop!"

There is the early apple and the late bearer and all kinds in between, so that there is a succession; and it is possible, even without the cold storage, to adorn the breakfast-table with a plate of shiny apples the year round. An apple is a good thing to begin the day with. The Philadelphia Bulletin quotes a physician as saying:

"I know a woman who cured a drunken husband without his knowledge by keeping always a plentiful supply of good apples on the dining table. The man ate these apples and finally stopped drinking altogether." This cure is entirely within the reach of possibility. The same physician advises any one afflicted with the love of drink to "eat three apples a day, and the horrible craving will gradually leave him. The cure will be greatly helped along by smoking as little as possible."

Another editor adds his testimony in favor of the use of fruits:

"Just after eating a good apple, a cigar or pipe will not taste very good. I know, for I have once been a smoker myself. And when you get all the good fruit that you want, especially some of a more acid character, such as apples, currants, lemons, oranges, grape-fruit, peaches, and plums, there will be little craving left for strong drink. Many of our drunkards are made in the kitchen where an excess of greasy food is prepared. Let the cure come through the food also, by adding a free supply of acid fruits to the daily bill of fare."

Let us not despise the Kansas apple. I am reminded of a story I have heard a gentleman tell. He was walking along the street in Cleveland a few years ago, when he observed an overgrown boy examining a bunch of bananas hanging in front of a grocery store. When he came up to him the young man said, "What's them?" When told they were bananas he replied, "Are they good to eat?" He was told that some people liked them. After careful examination of the bunch he said, "Are they any better than our apples?" I do not know how the gentleman replied, but he could have truthfully said of all the fruit, tropical and other kinds, there is not any fruit better or more satisfactory than "our apples."

The value of nuts as food is just beginning to be appreciated. It has been proven that peanuts afford twice as much nourishment as beefsteak, rice, beans, or cheese, and eight times as much as potatoes. Next to the peanut is the chestnut, which contains a great deal of starch and is used largely in Italy, taking the place of cereals and also in the finest grades of macaroni. Chestnuts are used in soup, force-meats, and many kinds of desserts. Almonds are not only nutritious but also a good digester when divested of their brown, tough skin, which is easily done by pouring boiling water over them and letting them stand three or four minutes and then rubbing them off. Then there are the English walnuts, filberts, hickory nuts, and pecans which are growing in favor with cooks for desserts, salads, cakes, etc.

Peanuts used raw, that is, without roasting, are more digestible than otherwise, and the more one eats of them the better they are liked. They are inexpensive as compared with meat, and there is no fear, as in eating meat, of taking something into the system that may be diseased. In addition to the plate of shiny apples on the breakfast table, let us have a dish of unroasted peanuts.

Dainty Foods Demand It

IN EVERY Receipt that calls for cream of tartar, soda, or baking powder, use the Royal Baking Powder. Better results will be obtained because of the absolute purity and great leavening strength of the Royal. It will make the food lighter, sweeter, of finer flavor, more digestible and wholesome. It is always reliable and uniform in its work.

Alum and phosphate baking powders—some of them sold at the same price and some of them cheaper—will make neither dainty nor wholesome food.

ROYAL BAKING POWDER CO., NEW YORK.

Bread.

Yeast should be soaked in tepid water. If the yeast is old it will help its action to add sugar to the water in which it is soaked. This is the recipe used for bread in the Kansas Agricultural College: For one loaf of bread use 1½ cups liquid, ¼ cup of yeast, 1 teaspoonful salt, 1 tablespoonful sugar, flour. Sterilize the liquid, let cool, then add yeast, sugar, and salt; add 2 cups of flour and beat thoroughly. Let it rise then work in enough flour to make a good dough. Knead well; let it rise again twice its bulk. No flour should be used in shaping the loaves, but all the flour should be used when kneaded.

TESTED RECIPES FOR MAKING BREAD.

HOMEMADE BREAD.—Two medium-sized potatoes, boiled and put through a sieve, one tablespoonful of salt, one teaspoonful of sugar, a lump of lard the size of an egg, two quarts of water and a teacupful of hop yeast.

GINGERBREAD.—Two cupfuls of molasses, one cupful of butter, two eggs, one cupful of brown sugar, one cupful of warm water and two teaspoonfuls of soda.

One and one-half cupfuls of molasses, one half of a cupful of lard, one half of a cupful of water, two eggs, one teaspoonful of soda, one half of a cupful of sugar, stiffen with flour.

One cupful of sugar, one cupful of molasses, one cupful of butter, one egg, one teaspoonful of cinnamon, one teaspoonful of ginger; stir all together. Dissolve two teaspoonfuls of soda in one cupful of boiling water, stir this in and add three cupfuls of sifted flour; bake in a hot oven.

SOFT GINGERBREAD NO. 1.—One half of a cupful of sugar, one cupful of molasses, one half of a cupful of butter, one teaspoonful each of cinnamon, cloves and ginger, two teaspoonfuls of soda dissolved in one cupful of boiling water, two and one half cupfuls of flour; add two well-beaten eggs the last thing before baking.

NO. 2.—One egg, one cupful of butter, one half of a cupful of sugar, one cupful of baking molasses, one cupful of boiling water, one teaspoonful of soda, one half of a teaspoonful of ginger; use flour enough to make a stiff batter.

TEA BISCUITS.—Two cupfuls of flour, two large teaspoonfuls of baking powder, one tablespoonful of lard, one fourth of a teaspoonful of salt. Mix flour, baking powder and salt together, then rub in lard; add milk enough for soft dough. Roll one inch thick and bake in hot oven.

HOT CROSS BUNS.—Here is a recipe for the genuine English Good Friday hot-cross buns: Dissolve in a generous half-pint of warm milk a quarter of a cupful of butter. Add this to a quart of sifted flour, half a cupful of sugar, half a teaspoonful of salt, half a grated nutmeg, half of a yeast cake; dissolve in a little water, and two eggs, the whites and yolks beaten separately. Mix into a soft dough, place it where it will not become chilled and let it rise over night. Take pieces of the dough

The American Boy

MAGAZINE

The Biggest, Brightest, Best Boy's Magazine in the World

**"GOOD ALL THE WAY THROUGH"**

That's what the boys of America say of THE AMERICAN BOY. It develops the taste for good reading, and interests boys in all manly sports, games, and exercises. Your boy will like

THE AMERICAN BOY

because it's all boy. You will like it because of the high character of its contents. Over 400 big pages. Over 100 stories. Over 1000 illustrations. Contains real stories of travel and achievement; instructive tales of history; games and sports; how to do things, etc.

the size of an egg and, with flour on your hands, mould them into round cakes an inch in thickness; put into a baking pan with little space between, then cover, and place where they will keep warm. When swollen to double their size, cut a cross in the center of each with a sharp knife, and bake for half hour in a moderate oven. When baked, rub with a syrup made of sugar and water.—Mrs. A. J. Bonn, Sterling.

The Young Folks

What Have We Done To-Day?
We shall do so much in the years to come,
But what have we done to-day?
We shall give our gold in princely sum,
But what did we give to-day?
We shall lift the heart and dry the tear,
We shall plant a hope in the place of fear,
We shall speak the words of love and cheer,
But what did we speak to-day?

We shall be so kind in the after awhile,
But what have we been to-day?
We shall bring to each lonely life a smile,

But what have we brought to-day?
We shall give to truth a grander birth,
And to steadfast faith a deeper worth,
We shall feed the hungering souls of earth,

But whom have we fed to-day?

We shall reap such joys in the by-and-by,
But what have we sown to-day?
We shall build us mansions in the sky,
But what have we built to-day?

'Tis sweet in idle dreams to bask,
But here and now do we our task?
Yes, this is the thing our souls must ask,
"What have we done to-day?"

—NIXON Waterman, in Christian Intelligencer.

Grandma's Story—a Talk About Dogs.

FLORENCE SHAW KELLOGG.

"Here children, here's something for you," said Mr. Gray, just returned from town, as he held a covered basket towards them. Susie opened it while the others crowded around her with eager interest.

"Oh, a puppy! a puppy!" screamed little Rose, as she danced about in glee. Tommy and Susie, though less noisy, were no less pleased, and all united in thanking their father for giving them "just what they wanted most," a beautiful Scotch Collie puppy whose soft eyes were already bright with intelligence.

"Oh, let's go quick and show him to grandma and have her help us name him," said Susie, and away they scampered. Grandma did not fail in showing her interest and pleasure and was quite willing to help in choosing a name for the new pet. She had just finished reading them Alfred Oliphant's romantic and beautiful story of "Bob, Son of Battle," and it was soon decided that the puppy should bear the name of that dear, faithful dog; and when at the first call of "Bob! Bob!" the puppy wagged his tail and looked up, Susie declared "He knows his name already," and after that there could be no doubt of the little fellow's great intelligence.

The talk naturally turned on dogs, and, almost before she knew how it happened, grandma was seated in her favorite chair with Rose in her lap, telling a story; and although she did not begin with "once on a time," the children knew it was all true, for grandma told none but true stories; and if the wise old lady did not "point a moral," they were learning many a good lesson from what she told them. In years to come, when life shall have grown earnest to them, the memory of the hours spent with her in the "chamber whose name was Peace," would be among the most blessed of their lives. But to our story.

"The first dog I dearly loved," began grandma, "was a black-and-white shepherd that we named Jack. My father bought him of Mr. Black, our nearest neighbor; but I, without knowing of this, supposed Mr. Black gave him to me, for he said when I was there playing with the puppies if I would carry one home I might have it. Jack was my choice; and, though I was only a tiny girl then, I well remember hugging the fat, squirming puppy home in my little apron. He was so fat and heavy that though it was only a short distance between the two houses, I had to stop by the roadside and rest before I got him home. He grew very fast and was a great pet among us children, but my father did not allow our petting and play to interfere with his training, and he became in time a very wise and valuable dog. He seemed to understand whatever was said to him quite as well as we did; and he sometimes put us to shame by his quick and willing obedience. When he grew old enough, it

was a part of his duty to drive the cows back and forth from the pasture to the milking-yard morning and night each day. Sometimes one cow would be missing. Then father would tell Jack of it just as he would tell a child, and the intelligent dog would go back to the pasture and hunt until she was found, when he would return driving her before him with an unmistakable air of pride, and he was as pleased as any boy over the praise given him. He seemed in every way one of the family, a dear playmate for us children, and a valuable helper to father. We all loved him dearly. I have told you how after he was an old dog, he learned to carry notes back and forth between our home and the new home to which my eldest sister had gone as a bride; all along the seven miles between the two homes—thickly settled miles they were, too—different ones, just to test his intelligence and fidelity, would try to take the notes from his neck, but all in vain. Come what might, he would only give them to the ones to whom he was told to carry them. Dear faithful old Jack! Though he lived to be so old that he lost all his playfulness and did little but lie around and sleep the last months of his life, we were very loath to let him go, and our tears fell fast when we knew he slept in death.

"It would be hard to find a more intelligent race of dogs than the shepherd, but a little, mongrel, yellow-brown dog your grandfather had when we were married—and for some time before—showed a marked degree of intelligence and no dog ever loved a master or was more faithful to one than was he."

"What was his name, grandma?" asked Rose, and "Was he little or big?" added Tommy.

"His name was Billie," answered grandma. "He was neither little nor big, but just a fat, roly-poly kind of a dog that your Aunt Martha said was the color of a 'burnt molasses cookie.' But he was smart and did many interesting things. He would own allegiance to no one but his master, and neither would he obey any one else, unless he chose to do so; but your grandfather's every command was law to him and we had to admire him for that, though his utter refusal to obey any one else was very trying at times."

"Was it Billie that knew the letter that came from his master, grandma?" asked Tommy.

"Yes, dear, that was Billie. And, went on grandma, "it was Billie that always slept on your grandfather's old coat or some other of his cast-off garments when he was away in Virginia, as he was all of one winter. It was always touching to see how he mourned his master's absence. His only comfort seemed to be to find some of his old clothes and make a bed of them. No one could fool him or make him take any others. I suppose with his keener sense of smell, he could detect some scent that he knew belonged only to his master that we could not perceive."

"Burroughs, you know, grandma," said Susie, "says 'a dog is almost a human product; he has been the companion of man so long, and has been so loved by him, that he has come to partake in a measure at least, of his master's nature.' Maybe there was some tie between grandfather and Billie that no one else knew of."

"May be so," returned grandma. "I am like Burroughs who in a recent letter to me said, 'I can believe almost anything of dogs. If they do not reason, they do something wonderfully like it.' I think we all have to come to this conclusion when we stop to think of all the wonderful things we know of dogs."

"Ernest Thompson Seton, in his fine stories of 'Bingo' and 'Willie' gives them many of man's attributes," said Tommy. "And," he added, "when you are reading his stories, you can hardly help agreeing with him, though I know Burrough's conclusions regarding reason in animals, particularly wild animals, are quite different from his."

"When doctors disagree who shall decide?" quoted grandma. "The difference between Seton and Burroughs is the difference between the young man's enthusiasm and an old man's conservatism; but Burrough's frank admission of the change that has come in his thinking, and his fear that, earlier in his life, he may have made too much of every bit of intelligence of bird, or four-footed animal that came under his observation, as he says 'the nature lover is always tempted to do, awakens our admiration and gives us confidence in him such as we can not feel for every one.' But I want to tell you something funny about Billie. His master's trip to Virginia, of which I have spoken, was for the purpose of getting a wife, and four months later, he took me home with him as proud and happy

Simpson - Eddystone Silver Greys

An almost limitless variety of artistic patterns—enough for every taste and fancy.

Desirable for dresses at any time of year.

Printed in absolutely fast color on fabrics of enduring texture.

Ask your dealer for Simpson-Eddystone Silver Greys.

Three generations of Simpsons have made Simpson Prints.

The Eddystone Mfg Co (Sole Makers) Philadelphia

Lowell Ingrain Carpet

WHY YOU SHOULD BUY IT

Because: It has been recognized for seventy-five years as the best INGRAIN manufactured—**ALL WOOL.**

Because: The goods are wound on a hollow stick which constitutes a trade-mark and guarantees that you are getting a **LOWELL INGRAIN.**

Because: Styles and colorings are up to date, in plain shades and figured patterns; closely resembling high-grade carpeting.

Because: **LOWELL INGRAINS** are so woven that they can be used on both sides: a feature decidedly advantageous. No one doubts the wisdom of covering a room entirely in a rural home, making it warmer and easier taken care of.

Ask your local dealer for a **LOWELL INGRAIN** when looking for a new carpet. Look for the hollow stick and be satisfied with none other than a **LOWELL INGRAIN.**

Manufactured by **BIGELOW CARPET CO., New York**

The Little Ones

The Bedtime Storybook.

There's something very, very queer
About a storybook,
No matter what's the time of year,
Nor where you chance to look,

No matter when it is begun,
How many pages read,
The very best of all the fun
Comes just the time for bed.

When mother whispers in your ear:
"Tis almost eight—just look!
Now finish up your chapter, dear,
And put away your book."

The minutes almost seem to race
When it is growing late;
The very most exciting place
Is just at half after eight.

—Anna Burnham Bryant.

Ants, Uncles, and Cousins.

MRS. A. D. GRAY.

"Mother, oh mother!" called Ruth's voice, as she tried to tiptoe high enough to peep in at the window. "Are you there? Well, Helen and I are out here on the steps, and our ants are acting so crazy and funny. There's a lot more of them, too; do you suppose they are visitors?"

"No, for ants don't have visitors. If one comes, they drive him away or kill him."

"Oh, my! how unpolite!" said Ruth. "Tell us some more, mother, about the farmer ants—you promised."

"In five minutes," I said, "and you little girls watch very closely, and see if you can tell what is going on at your ant-hill."

A few moments later, when I drew my chair to the window, and took up my work, two very eager, interested little faces bent over the ant-hill.

"Look, look Ruth!" cried Helen. "They are bringing in tiny bundles; what do you suppose they've found?"

"Why it's other little live things—looks like worms," said Ruth. "Tis worms, for sure. Do tell us what they are trying to do, mother."

"Very well, this is a good place to begin," I said. "In every ant-hill, there are drones, queen ants, and workers. The queen ant does not rule the others, as the queen bee does. Her chief work is to lay the eggs. There are also builders, servants, nurses, and soldiers. Out of the queen ant's eggs come very lively, hungry baby-ants. They do not look like ants, however, but like little white worms. But I think the funniest part of all is, that this little white worm has to be fed, kept warm and dry, taken for walks into the sun and air and cared for, very much as we care for a real baby."

"The nurses are very kind to the baby-ants. They carry them out into the sunshine, and back to the hill again. They lick them all over to keep them clean and white, almost as the mother cat does the little kittens. They feed them, too, four or five times each day. After the worm has grown, it spins itself a fine, thin web and wraps all up in it. In a short time, it comes out a full-grown ant, with legs and wings."

"Then the hill becomes so full of brothers and sisters and cousins, that some of the new ants swarm, and fly away to start a new hill. The ones you were watching awhile ago are the nurses who have been taking the baby-ants out for an airing."

"The farmer ant lives in Texas and Florida and other very warm States. This ant raises its own grain for food; it is called ant-rice. These ants have very large hills—as large as a room sometimes. They cut down all grass or other grain, except this one kind. When the seeds of this ant-rice fall, all the workers hasten out and gather them up, one seed at a time, and carry them into the storeroom."

When all of the ant-rice has fallen they cut down the old stems, so that the land will be all ready for another crop. Don't you think that is very strange and wonderful?

"There's a very tiny brown ant that makes her nest of little balls of mud, which she rolls up, and then places as if they were bricks. This is called the mason ant."

"Then there are carpenter ants, who do much harm; they cut their way into trees and beams, and often make them fall."

"The strangest kind, I think, are the parasol ants. They live only in very hot countries—mostly in South America, where the sun is hot. These are very large and they cut for themselves bits of leaf, as large as a dime. They carry these in their jaws by a tiny piece left for a stem. They look very funny indeed, marching along two by two, each carrying his parasol. They line their homes with these bits of leaf to

Every Niece and Nephew of Uncle Sam

should be deeply interested in what he has said about soda crackers, because they are the one food with which all of them are familiar.

Uncle Sam has given out figures showing that soda crackers are richer in nutriment and body-building elements, properly proportioned, than any food made from flour.

This is saying much for common soda crackers, and much more for **Uneeda Biscuit**, because they are soda crackers of the best quality. They are baked better—more scientifically. They are packed better—more cleanly. The damp, dust and odor proof package retains all the goodness and nutriment of the wheat, all the freshness of the best baking, all the purity of the cleanest bakeries.

Your Uncle Sam has shown what food he thinks best for his people. His people have shown that they think **Uneeda Biscuit** the best of that food, nearly 400,000,000 packages having already been consumed.

Uneeda Biscuit

NATIONAL BISCUIT COMPANY

keep the dirt from falling in; at least that is what their purpose seems to be.

"You see that though people are very wise, there are some things they do not fully understand, and ants are one of them.

"I am sure you little girls will learn some things by watching your ant-hill, and if you do, you must be sure to tell me, too."

A New Club.

I am happy to add to the club roll the "Mutual Helpers", of Madison, Kansas. The report above indicates that they are all their names implies—and more. The motto, if practiced, will

cause their helpfulness to reach farther than themselves, and their influence will be felt beyond their immediate surroundings.

ART PROGRAM.

Jules Breton.

I. Breton the artist.

II. "The Song of the Lark."

III. The French peasant.

IV. "Planting of Calvary."

I. The program of Jules Breton three weeks ago treated of his life up to the time he began his career as an artist. The paper under this topic should tell of his life and work, beginning with the terrible days of the revolution. He was so impressed with the misery of that time that he painted then his only sad picture—his first Salon picture, "Want and Despair." It was a great disappointment to him and he learned that sad pictures were not for him to paint.

II. Give a description of this happy peasant girl and her surroundings as she looks to you. Can you not hear the notes of the lark in your imagination? Is not the gladness and joy of the singing lark in her heart as she begins her daily toil? The sun just showing behind the trees tells the time of day. Breton loved the sunrise and sunset, and enjoyed watching the gleam of gold on the edges of the clothing, the sickles and the grain. Can you find it in the pictures?

III. The peasant was the subject of so many of Breton's pictures that a paper about the peasant life in France would help one to understand and appreciate his pictures more, and enlighten one very much also.

IV. One of his happiest pictures is the "Planting of Calvary." These calvaries were little chapels or crosses on top of a hill and an important ceremony attended the planting of them. It was this that prompted him to paint this picture. The little girl who was his playmate and sweetheart and afterwards consented to be his wife, posed as one of the young girls. She carries the crown of thorns.

The Mutual Helpers.

We organized February 14, 1906. You see, we are yet in our infancy, but most of our members have had experience in club work.

We are known as the "Mutual Helpers" and have taken kindness as our

watchword. We have adopted the Sunshiners' motto, "Have you had a kindness shown? Pass it on." Our club hymn is "Pass It On," our flower is the snowdrop, and our colors are white and green.

The object of our club is to promote sociability, encourage the art of fancy work and do all the good that our hands find to do.

We meet semi-monthly at the homes of the various members as their names come on a list alphabetically arranged.

We have divided the year into quarters and have taken a subject for each meeting during a quarter. This list is to be revised from time to time. Following is the list as it now stands: (1) Seasonable Recipes. (2) Notable events of the last quarter. (3) Club news. (4) Response by quotations. (5) Short story. (6) Miscellaneous.

Our officers consist of an honored helper, assistant helper, recording helper, and art instructor. After the work for the day has been completed, light refreshments are served and we have our social hour.

Our club is composed entirely of country women and I assure you these meetings are a source of pleasure to all of us. We go home feeling younger and happier and take up the burdens of life with new energy and courage.

A MEMBER.

THE INTERNATIONAL SUNDAY SCHOOL LESSON.

(Copyright, 1906, by Davis W. Clark.)

First Quarter. Lesson 12.

Proverbs 23:29-35. March 25, 1906.

A Temperance Lesson.

Israel's poet king and prodigies of wisdom sets himself to the task of painting the drunkard's portrait. It is a faithful likeness, and horrid because faithful. The royal artist persists in his undertaking, though his canvas grows lurid and frightful under each successive stroke of the pencil. His picture has proved a veritable danger signal, flashing its warning color upon successive generations for three thousand years. Its red light has proved a powerful deterrent to multitudes. Nowhere in literature is the woe, the sorrow, the folly, the fate of the drunkard so powerfully depicted. . . . That such a picture could be painted thirty centuries ago, sufficiently proves the antiquity of the vice. Drunkenness is no modern sin or mere accident of our civilization. It is

as old as Noah and older. Intoxicating liquors undoubtedly inflamed the race before the flood and led on to that nameless depravity which had to be drowned out in that awful judgment. And each succeeding generation has suffered the crushing weight of this dreadful woe; each has been burned, bitten and poisoned by this vice; from each has burst the sorrowful and despairing interjections, "O!" "Alas!"

Old as it is, Solomon's picture is the very similitude of the drunkard of to-day. Three thousand years have not sufficed to change the causes or effects of intemperance. Study the successive strokes of this masterful delination. . . . Those who tarry at wine, by the increase of the powerful and subtle appetite, are compelled to seek stronger potations (mixed wine). The gradation from light wine to red wine, and the highly alcoholized wine, with its eyes or beads, is inevitable. Then follows the facial signs of incipiency (redness of eyes); next quarrelsome ness, causeless wounds, and the inflaming of sexual passion. Finally incipient dementia, which makes the drunkard oblivious to personal danger and to indignities visited upon him by hooting mob or officer of law—a dementia in which, however, the appetite persistently asserts itself, the worm dieth not, the fire is not quenched. All is forgotten; all is lost; but among the debris of mind, heart and manhood, the conqueror stalks. "And careth naught for the awful ruin he hath wrought."

This is no pleasing fancy sketch of genius, nor happy aesthetical study; but it deserves the close, respectful attention of every one who loves himself and his neighbor. No Christian can push this picture aside unless his Bible permits him to say, "I am not my brother's keeper." No truly philanthropic spirit, Christian or not, can turn with indifferent coolness from this inspired canvas. It pictures the all-embracing "woe," making its piteous appeal to every one who professes to love his species. And if neither Christianity nor philanthropy is sufficient, from sheer self-interest the citizen must sooner or later give attention to this mirror which Solomon holds up before our time. Individuals in their collective or governmental capacity, must take stand against a traffic which produces deteriorated manhood, insanity, pauperism, crime, and death.

How We Should Dairy.

(Continued from page 314.)

and the result is that we have practically two fresh cows per year. Then, again, we have the cow dry during the months of July and August when the weather is excessively hot and flies are the most troublesome and when farm work is most urgent. By winter dairying we get the best prices for our product and we have lucrative work for our farm help during the winter when that help is cheapest.

It is easier to produce a good calf during the fall and winter than during the summer months. We can not afford in Kansas to overlook the value of a good calf. The skim-milk calf can be produced much cheaper than the calf which has been allowed to suckle the cow all summer. We hear farmers everywhere remark that there is nothing in keeping a cow a year for a calf. The time has come when we must produce a cheaper calf than we have heretofore. There is no reason why the skim-milk calf should not be as thrifty and weigh as much at one year old, as the calf raised the old and more expensive way. We must not overlook the production of a good calf and the proper utilization of the skim-milk in the feeding of both calves and pigs. Skim-milk for feeding young animals has no substitute. We can not get along without milk for young animals. We do not place a sufficiently high value on skim-milk. It is worth, as estimated by farmers, from 20 to 50 cents per hundred. Therefore, we must dispose of our skim-milk to the best advantage if we are to realize the fullest returns from our dairy operations.

There is no business of which we know, which will pay us as well for intelligent work as will the dairy. It gives to every man of brain capacity an opportunity to reap a golden harvest for every hour of thought and study which he gives the business. The most successful dairyman is the most intelligent dairyman. There is nothing about the dairy business which the man of ordinary intelligence can not master. It is a matter which the farmer can determine only through his own efforts and his own labors, if he makes money from his dairy. Every farmer can make the dairy pay if he will and it can be conducted as a most important adjunct to the farm operations. The

beauty of the dairy business is that a man can raise just as much corn and just as much wheat on his farm with the dairy as without, and when corn and wheat fail, he has a monthly cash income from his cows. This is really a great deal to the Kansas farmer.

A Premium for Good Cream.

By I. D. Graham, Secretary of the Kansas State Dairy Association.

"We recommend the system of buying cream on grade, believing that the purchase of cream on its merits by which a higher price is paid for cream of good quality as compared with cream of poor quality, is absolutely essential to the life and future success of the dairy industry in Kansas."—Resolution adopted by the Kansas State Dairy Association at its annual meeting at Abilene, Kans., March 3, 1906.

The dairy industry in Kansas has grown remarkably in the last ten years, and yet the industry in this State is only in its infancy. The farmers of Kansas have only begun to realize the advantages to be derived from the sale of the dairy products of a small herd of cows. The farmers have not yet begun to utilize the roughage and feeds produced on their farms, which can be converted into cash through the dairy cow. The climate and natural conditions in this State are unusually favorable to the production of dairy products. The winters are mild and short compared with Minnesota, Wisconsin, and other States which lead us in dairy production. Our soil and climate produce the best and cheapest milk feeds on earth. We, therefore, consider that there is a very great future for the dairy industry in this country.

In the future development and growth of the business, however, there is one thing which must not be lost sight of, and which must be considered if the future of the dairy industry is to be as permanent as it should be. That feature is the quality of the dairy product. It is a fact that Kansas butter does not enjoy as good a reputation in the markets of the world to-day, as it did five years ago when creamery operations in this State were on the whole-milk basis. The hand separator has succeeded the whole-milk plan and the result is poorer quality of the butter produced—not because the cream from hand separators should be any poorer than that from whole milk, but because of the fact that the patron using the hand separator, has been led to believe that his cream could be delivered once per week or once in ten days, and that it would make good butter. The creameries have been so anxious for a large volume of product, that little or no attention has been paid to the quality of cream received from its patrons. The creameries in the past have paid the farmer as much money for butter-fat delivered once per week or once every ten days, as they have for cream delivered two or three times per week. This action on the part of the creameries has therefore placed a premium on infrequent delivery, and on the conduct of the dairy business in a haphazard way. To the fair-minded patron this will appeal as wrong.

Recognizing the fact that unless a better quality of butter can be produced from the cream delivered to the receiving stations in this State, there will be a decreasing demand for butter from the West and that butter prices will be lower and consequently lower butter-fat prices paid to the farmer, we are commanding the State Dairy Association for the endorsement of a plan by which cream is bought and paid for on its merits.

There are creameries in this country now buying their cream on a grading plan and that plan is based on the frequency of delivery. In Minnesota, a State which has carried off the highest honors ever since the organization of the National Buttermakers' Convention some ten or twelve years ago, hand separator cream is delivered daily and will not be accepted if delivered less frequently. By this means the standard of cream has been held to the highest possible limit, and the very best butter produced in the United States comes from that State. It is a notable fact that even in Kansas from stations where cream is delivered most frequently, that cream is the best quality. Therefore, we see that frequency of delivery is an important essential to the delivery of good cream and the manufacture of good butter. We understand that some creameries are now offering a premium for butter-fat delivered twice per week during the present season of the year, which tests more than 30 per cent. This premium

price is four cents in advance of the price paid for second grade cream which, according to the grading system now in vogue, is delivered less frequently than twice per week during the present season, and tests under 30 per cent. We are told that the improvement in quality of butter so far, has been very noticeable indeed; so much so that a high premium for first grade butter-fat can easily be maintained. The grading system, as proposed, places a premium upon industry and careful methods in the dairy. It pays the careful dairy farmer a premium for his effort in producing a good cream, and this grading system will eventually create, wherever it is used, a class of dairymen who will produce only a first-class product and who, being paid well for their labor, will increase the volume of their product; and thus the dairy interests in this country will be placed upon a more substantial foundation with greater prospects for future success, than by any other means yet proposed.

The writer was in New York not long ago and made a visit to the butter commission houses in that city. We found those houses had their coolers piled full of second-grade butter, and that such butter was begging for a market at a price ranging from six to eight cents below the prices asked for first-quality butter. The first-quality butter was disposed of as soon as it appeared on the market, while the second grade could not be sold.

Every pound of second-grade cream and butter costs the farmer as much to produce as a pound of first grade. The expense has been identically the same and the difference in price received for second-grade cream as compared with first-grade cream, is an actual loss to the farmer. The Kansas farmer and the Kansas dairy industry can not afford to produce second-grade cream. A cream-grading system therefore, should be recommended by every farmer, and we understand this is meeting with general approval. We recognize in it the only system which will build up the business in this State; and we admire the grit shown by the various companies in venturing to establish their grading system. The patrons who favor this system should do everything they can to assist in maintaining it. The dairy industry in Kansas ranks next to our great wheat and corn crops and is much more certain than either. We can not afford to sacrifice our dairy industry by making a poor quality of butter which will not sell at the highest prices on our markets.

The Breeding and Handling of Dairy Cows.

Lecture by Prof. Oscar Erf, Chief Dairy Department, Kansas Agricultural College, at the National Dairy Farmers' Convention on Thursday, February 22, at Chicago.

The profits of a dairy depend largely upon the good qualities of the cows and the way they are kept. Breeding is an important factor and often determines the profit or loss in the business. According to the statistics of the U. S. Department of Agriculture, the average

Number of cow	Milk lbs.	Av. test per cent	Butter-fat lbs.	Cost of feed dollars	Butter- fat 15¢ per 100 pounds	Value Skim-milk Total	Receipts less produc- ing cost of butter-fat feed, per pound	
							SECOND LOT.	THIRD LOT.

cow produces approximately 131 pounds of butter-fat per year. If we base our calculations on the average market price of feed that a cow consumes, and the care she requires, we find that it would take at least 175 pounds of butter fat to pay for the feed of a cow for one year. According to these statistics, there are a great many cows in the United States that do not produce enough butter-fat to pay for their feed and care. The problem confronting us

You Will Prosper in the Great Southwest

In Oklahoma, Indian Territory and Texas are vast areas of unimproved land—land not now yielding the crops of which it is capable. The same conditions apply to the towns. Few lines of business are adequately represented. There are openings of all sorts—for mills and factories, for small stores, for banks, newspapers and lumber yards. You have only to get on the ground to prove this. To enable you to do so the Missouri, Kansas & Texas Ry offers

Rates Cheaper Than Ever February 20th and March 6th and 20th

On above dates most lines will sell both one-way and round-trip tickets at exceptionally low rates. If your nearest railroad agent can not give you the rates, write me for particulars.

If you're in any way interested in the Southwest, I'd like to send you my paper "The Coming Country." Address

"SOUTHWEST."

is how to secure animals that will pay for their feed. The only practicable method that we have to suggest to dairymen, is to determine the value of each individual animal by weighing the milk and testing the same for three consecutive days each month throughout the period of lactation. Then estimate the cost of feed that a cow has consumed, and the difference between the value of the food consumed and the value of the milk produced, determines the profit or loss. It is safe in this case to take feed as the basis of cost, against butter-fat as the basis of production, for in most cases such expenses as labor, interest on investment, deterioration by age, and general expenses, may be offset by the value of skim-milk, buttermilk, manure, and the value of the calf.

As yet, we have no absolute proof that a cow, tested for a year and making a high record, will continue to do so throughout the prime of her life. After a cow has once proven to be profitable, the future of that cow, if she has not passed the prime of her life, depends entirely upon the care and handling that she receives. Many a good cow has been ruined at the hands of an unsuccessful dairyman, who has either neglected her by not milking her properly, or by not feeding her properly and otherwise abusing her.

The individuality of an animal can be best brought out by a table which represents an experiment conducted by the Kansas State Agricultural College:

A Year's Record of a Herd.

FIRST LOT.

Products Cost of feed, per pound

Skim-milk Butter-fat

100 pounds 15¢ per pound

Total Value

Receipts less producing cost of butter-fat feed, per pound

Second lot Butter-fat

15¢ per pound

Third lot Butter-fat

15¢ per pound

Loss

51. 52. 53. 54. 55.

56. 57. 58. 59. 60.

This table represents a scheme in which fifteen cows are divided into three lots of five cows each. The first lot produced butter-fat for approximately 10 cents per pound, the next lot 15 cents, and the third lot 20 cents. These were common cows, such as are kept by the average farmer, and you will note that here is the reason why so many dairy-farmers who have a large number of cows may not make any profits because they fail to pay

attention to the individuality of the animal.

Assuming now that the market price of butter-fat is 15 cents per pound, which is very low, the center group would neither make a profit nor a loss. The first lot would make a profit of 5 cents per pound of butter-fat produced, and the last lot would make a loss of 5 cents per pound of butter-fat produced. Hence, the loss made by the last five, assuming that conditions were equal, would balance the gain of the first five. Therefore this whole lot of cows would neither make a profit nor a loss. From this it is very readily seen that if the last two lots of cows were discarded, the first five cows would make a profit of \$126 per year. However, the average price paid in Kansas for butter-fat for the last year was 22 cents per pound; hence all of these cows would have made a profit.

According to this scheme, a man that would test and keep a record of his cows would be paid for his work to the extent of \$126 per year for the five cows. The question may arise, will these cows continue their performance from year to year, and may it not be that some of the other cows will do better in the succeeding years? It is true that there is some danger on basing conclusions on one year's record, for some cows produce more one year than they do another. These records are of greater value when they are kept continually. However, two years' record should determine quite definitely the capacity of a cow. There is a possibility then of such an occurrence in the second class of cows, but there is little risk to run for any cow of the last lot to deviate from her one year's record, and double her capacity so that it will come up to the standard of the first lot. Since the second lot pays for the labor and feed involved, it might be well to keep a number of these animals and try them for the second year. If at the end of the second year they have failed to come up to the requirements of producing butter-fat for less than the average market price, they should be sold.

When once a herd has been established, and, with possibly a few exceptions, the cows are profitable and have good milking qualities, there comes that ever-puzzling question of how to perpetuate the qualities of good ones that have been selected, and whether or not by breeding, these qualities can be reproduced in the offspring from a good cow if the sire is of equally good milking strain.

Environment, which includes the handling and care of a cow, has much to do in gradually increasing the capacity for milk-production. A marked increase in production can not be brought about in this way in one individual, but by keeping cows and bulls under the most favorable conditions, the capacity of a herd can ultimately be increased by each generation. Environment works hand in hand with the laws of breeding. In fact, dairy cattle have been brought to the present stage of productivity by care and selection. The effect of environment on animal-breeding can be well illustrated in the following manner: The Holstein-Friesian breed originated in the lowlands of Holland and Northern Germany, where the forage and grass grew rank and tall and not very rich in nutrients. These animals adapted themselves to this particular environment by developing rather a large frame and body in order to handle the feed. On the other hand, the Jerseys originated in the isle of Jersey, which on account of its hilly character and poor soil, produced a grass which was short but quite nutritious, developing a class of animals small and particularly adapted to that region and for that kind of feed. While it is true that environment influences milk-production to a certain extent, it is however a fact that the laws of breeding have a greater influence on individuals. But in order to increase the production, the handling and care of the dairy cow must not be lost sight of.

The laws of breeding are complicated and interlaced. Furthermore, there are a great many influences that assert themselves in practical operations so that it becomes impossible to single out a definite law that will always bring the same results.

Taking out the element of environment, there are two principal conditions in breeding which stand out prominently and which bring forth apparently the best results. (1) It is the old law in breeding that "like breeds like," which means that the mating of two characters which are bred for many generations, will become fixed in the offspring. By this law it is not possible to increase the capacity for milk-production of an individual more

than that of her ancestry. For instance, we assume that a strain has been bred for many generations, which has the characteristic of producing 30 pounds of milk per day, on an average. If two animals with this particular character were bred together, we can expect nothing more than that the female offspring will have the capacity of producing 30 pounds of milk per day, assuming that in this statement all other functions correlate in approximately the same per cent as in all future generations. A characteristic, such as the milking quality of a cow, can be fixed most readily by continuous in-and-in breeding. This is the method that nature uses in establishing all kinds of types of animals suited for their particular condition and environment. For instance, the squirrel is the same animal that it was a thousand years ago. The quail is the same size that it was centuries ago, and with these there is in-and-in breeding year after year. We can go to the fields and the forest and find plenty of wild animals that maintain their species with the closest type, generation after generation and year after year.

The idea generally prevails, that by in-and-in breeding weaknesses occur and that the capacity for milk-production will be decreased. Such influences can only come about when two animals of weak constitution are bred together. This weak constitution has been acquired by conditions to which the animal has been subjected. Hence, to avoid this possibility, start with a strong class of individuals and always breed from sires of strong, dominant character, to females of equally vigorous character.

(2) The second condition is, that if two animals of dissimilar characters are bred together, the offspring will assume the qualities principally of the individual that has a dominant character; but the fixed characteristics of either animal are more or less disturbed and in succeeding generations almost any gradation and blending of the cross can be expected. As a matter of fact, when two animals of good milking strain are bred together, we generally get an offspring that is quite superior in milk-production to either of the ancestors. However, this can not be absolutely relied upon, but is the best way to increase the capacity for milk-production. To perpetuate the character in succeeding generations, this cross must be bred to a male who has a dominant character for milk-production inherited from his ancestors. If no such strain of animals is available, it is wise to breed this offspring back to its sire in order to fix this character. For instance, a bull and a cow are mated, both from different strains. The dam and the sire's dam have the character to produce 20 pounds of milk per day well established, but these strains for many generations back are not related to each other. The offspring from this cross may only have a capacity of 15 pounds. However, it is more likely to have the capacity to produce 30 pounds. To fix this character in succeeding generations, it would be wise to breed this offspring back to its sire, which has but 20 pounds capacity, while there is a possibility of slightly reducing the capacity of the offspring; yet it fixes the character and makes it more permanent for future generations. But if you desire to run the risk of a still greater increase in milk-production, it would be well to breed this cow with a capacity of 30 pounds of milk per day to a sire of another strain, which has an average capacity of 30 pounds per day. The closer a strain is related, the more permanent and the more reliable will be the fixing of that character for all future generations at 30 pounds capacity.

The above example relates to strains of one particular breed, which has come under my observation, but in some localities it is made a practice to cross-breed a dairy breed with some beef breed, as for instance, the Jersey with the Shorthorn, in order to increase the size of the offspring without affecting the milk-production. While this is being practiced the results will become quite indefinite and unsatisfactory. Some scientists say that Mendel's law comes into play here. While I have no absolute data to prove this statement, it may be true, and I have some confidence in it from some incidents that I have noticed. Mendel's law is based on the law of chance, and in brief, is that on second and later generations of a cross-breed; every possible combination of parent characters occurs, and each combination appears in nearly a definite proportion of the individuals. For illustration, a Jersey with good milking qualities is bred to a Shorthorn with a beef character. Both animals are pure-bred. Let J rep-

resent Jersey characteristics; M milking qualities; S, Shorthorn characteristics; and B the beef qualities. A character that asserts itself prominently is known as the dominant character, and is represented by a capital. A hidden or latent character is known as recessive, and is represented by a small letter. JM and SB are bred together and the result will be JsBm,

JM } Js Bm
SB }

meaning a cross with Jersey character dominant, Shorthorn recessive, beef qualities dominant, and milking qualities recessive. If two cross-bred animals are mated, we would have a mixture of four kinds of characters in the male to four kinds of characters in the female. On the average, one-fourth of each kind will combine and we have a combination of characters like this:

Male.	Female.
JM	JM
JB	JB
SM	SM
SB	SB

1. JM X JM = JM.
2. JB X JM = JBm.
3. SM X JM = JsM.
4. SB X JM = JsBm.
5. JM X JB = JBM.
6. JB X JB = JB.
7. SM X JB = JsBm.
8. SB X JB = JsB.
9. JM X Sm = JsM.
10. JB X sm = JsBm.
11. SM X SM = SM.
12. SB X Sm = Sm.
13. JM X SB = JsBm.
14. JB X SB = JSB.
15. Sm X SB = Sm.
16. SB X SB = SB.

Here it will be noticed that two and five give the same results. Similarly, 3 and 9, 8 and 14, 12 and 15, 4 and 7, 10 and 13. We may therefore represent the cross-breed and its progeny as follows:

One part Jersey dominant with beef quality dominant.

Two parts Jersey dominant with beef qualities dominant and milk recessive.

One part Jersey dominant with the milking qualities dominant.

Four parts Jersey dominant, Shorthorn recessive, with the beef qualities dominant and milk recessive.

Two parts Jersey dominant, Shorthorn recessive, and milk dominant.

One part Shorthorn with beef qualities dominant.

One part Shorthorn dominant, with beef qualities dominant, milking qualities recessive.

One part Shorthorn with milking qualities dominant.

Of the nine types, four of them, 1, 3, 7, and 8 are supposed to be pure and will reproduce themselves. It will be noticed that each of these pure types constitutes one-sixteenth of the progeny of the cross-bred. Four other types have one latent character which constitutes two-sixteenths of the whole. The last four, with two latent characters, constitute four-sixteenths. The law continues to operate in the above manner.

While this is still an experiment with dairy cattle, it becomes impracticable for the individual dairyman, since it requires too much expense and time to get results. The solution of the whole problem of breeding dairy animals from a practical standpoint, can be summarized in a few brief principles. Get a bull of some recognized breed with a long line of high milk-producing ancestry, and see as many of them as possible that are within your reach. Find out if the dam and grandam had good dairy qualities. Although it appears entirely a female function, it is transmitted largely through the sire. Be sure and get a sire that is from a better milk-producing strain than your own cows, and notice that he has the power of transmitting his own characteristics to the offspring. The best calf to raise, then, is the one that shows most largely the qualities of the sire. Observe closely in connection with this, and it will be found that it is generally the calves of cows that show the greatest improvement from feed and better care that are best to keep.

With these conditions it is always advisable to raise as many calves as possible, with the expectation of discarding many of them when 2 or 3 years old, or even before that time if we see any tendency to revert to some original ancestry poor in milk-production. In-and-in breed as much as possible in order to reduce to a minimum the tendency to revert, by breeding the sires to the heifers, or to another which closely resembles them, and you will have a basis for a good strain of cows. However, during this time we must not lose sight of the fact that better feed and care has a great deal to do with the improvement of the herd. This is particularly the case in the development of a heifer. Feed them good, rich, nitrogenous feed during their growing period. Give them plenty of

exercise and fresh air and a good, clean, sanitary place to sleep. After the heifers have produced their second calf, if they have not come up to the standard of a good cow, discard them and continue to breed from those that produce milk and butter-fat at a profit. To carry out these principles requires considerable time and money, but it will bring results.

I should be glad to see the time come, and that soon, when dairymen will unite their efforts and establish test associations, and in connection a breeding association, which will control the breeding of cows and the selecting of bulls from records and performances. This can be very easily established in communities where there are a great number of individuals of one breed, this association to employ a competent man to test the cows and keep a record of their breeding, and this man also to be in charge of the male animals purchased or bred by the association, from a good milking strain and possessing dominant characteristics which will be perpetuated on his offspring. There is undoubtedly no better and safer method to increase the milk-production of individual cows and to perpetuate the strain.

THE EMPIRE WAY.

On the evening of Saturday, February 24, there started from Chicago a special train consisting of six sleepers, a dining-car, an observation- and a baggage-car. The destination of this train was Bloomfield, N. J., the home of the Empire cream-separator. On board the train were the general agents and salesmen of the Empire Separator Company to the number of about eighty, and twenty-nine representatives of the principal agricultural papers of the United States. The route was laid over the Grand Trunk line from Chicago to Buffalo, which included a stop of six hours at Niagara Falls. From Buffalo to Bloomfield, N. J., the route was over the Delaware and Lackawanna, which road furnished the train.

The expense of the trip, including the chartering of the train of sleeping-cars, the furnishing of the meals on the dining-car, a banquet at the Prospect House at Niagara Falls, a trip down the Gorge to Queenstown and Louiston from Niagara Falls, and every other expense incident to such a trip and the royal entertainment of every man on board, was borne by the Empire Cream Separator Company.

ERNEST E. BELL,
Secretary and Sales Manager of the
Empire Cream Separator Co.,
Bloomfield, N. J.

The purpose of this trip was to give the selling agents of the Company an insight into the various processes of manufacture of the Empire cream-separator and to give the newspaper representatives such knowledge as would prove an inspiration in their comments in regard to this machine.

Never in all history, so far as the writer can learn, has there been an industrial organization of any sort which possessed at once the keep foresight, the cash to spend, and the nerve to spend it in carrying more than 100 men half way across the continent, furnishing them with every comfort of life for eight days, and sending them home brim full of enthusiasm, with no other object in view than that of giving these men accurate knowledge at first hand.

Four days were spent at the factory. These were devoted entirely to educational work. Each forenoon was spent in studying the methods and materials of the factory, and each afternoon was

devoted to institute work in which ways and means were discussed. Lectures were given by heads of departments of the factory, and questions and experiences by the fieldmen present.

Each division of the factory was numbered, and a small catalogue was prepared to guide the visitor and give him accurate information as to the operations performed in the sections visited. With this catalogue and under the guidance of some expert connected with the factory, each one of the party was enabled to see every operation through which each of the component parts of the Empire cream-separator was put before the final assembly in the perfect machine. The motto of the Empire Separator Company is "Not how cheap, but how good," and

is sales manager of the Empire Separator Company and who acted as chairman, would tolerate no disparaging remarks in regard to rival machines. His men were told distinctly and positively that their motto should be "Push, and not Knock." It is true that he tried to show them that they had a good machine. He showed them that a poor machine was a poor investment; that a tolerably good machine was like a tolerably good egg, of doubtful value.

One entire meeting was devoted to the discussion of dairy methods with the object of securing better cream and, consequently, better butter. It was shown that millions of pounds of inferior butter, known as "dairy seconds," were now in cold storage with

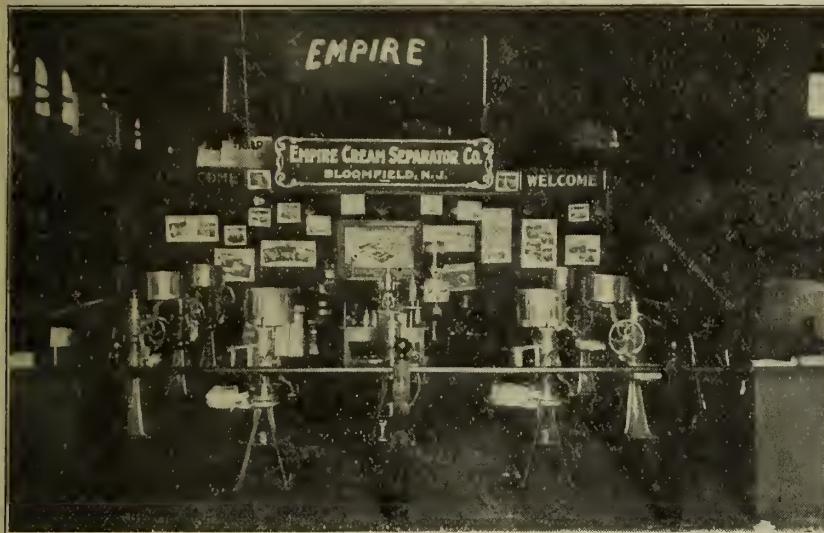

Exhibit of the Empire Separator Company, Bloomfield, N. J., at the National Dairy Show, Chicago, Ill.

perhaps the most interesting phase of our visit to the factory was shown in the quality of the materials used. The writer was impressed with this quality from his own personal examination, and later on he had the privilege of listening to a lecture given to the assembled agents by the expert who has charge of the supplying of all the materials that are used in the machine. Some of these materials are imported from Sweden because the quality necessary can not be made in this country. Nothing but the best material obtainable is used in any part of the machine. The bowl of the Empire separator is made from solid drawn steel tubing by a special process which is known and practiced by only one manufacturing concern in the United States. The highest quality of steel is used and the bowl is drawn thicker than necessary so that the outer and inner surface of the tubing may be pared away by the lathe and thus leave the heart, which is of the highest quality, for the bowl. Some bowls used in other separators are made of electrically-welded sheets of metal, which, in the high speed necessary to a separator bowl, are liable to break at the weld with disastrous results to the machine. It is impossible to break the Empire bowl. Greater care and better materials could not be used in the highest quality of watches than are used in the Empire separator. It is a marvel of mechanical perfection.

A large portion of the work is done by automatic machinery whose product is absolutely and mathematically accurate. Each part manufactured for these machines is interchangeable with all like parts. A new anti-friction device has just been added which practically makes the Empire separator frictionless. The writer stood by one of these hand separators and timed the revolutions of the bowl after the power had been removed. It was speeded up to the proper speed and the handle dropped, after which the bowl revolved for thirty minutes so free is it from friction. A machine that will revolve for half an hour after the power has ceased to be applied, is about as nearly perfect as human ingenuity and skill could make it.

In their competition with other separators in the field, the Empire Company believes that its best method is to make a better machine than the others do. Whether this has been accomplished or not, the fact remains that their machine is so nearly perfect that none but an expert could criticize it, and it would take a remarkable expert to do that.

In the meetings which were held daily at the factory, discussions were had of methods and every phase of the business that comes into the life of a salesman. It was noticeable that in these meetings Ernest E. Bell, who

no buyers. It was shown that this condition of affairs is to some extent the result of the work of irresponsible and unscrupulous salesmen who tell the farmers that it is not necessary to wash their separators, or at least that it is not necessary to wash them often than once a week; who tell them that it is not necessary to deliver their cream more than once a week in winter and twice a week in the summer; in fact, who tell them almost anything in order to effect the sale of a separator. It was brought out very strongly at this meeting that it is a part of the business of every salesman who handles a good separator, to teach the purchaser, so far as he can, good dairy methods and practice so the best results may be obtained from the use of the machine.

One of the most important matters discussed before these meetings was the subject of graded cream. The common practice all over the country since the development of the hand separator and the centralized creamery plant within the last few years, has been to receive any kind of cream at any time, and pay the same price for cream that is not only bad but absolutely rotten, that is paid for cream of good quality. This is not only an injustice to the creamery buying the cream, but to the separator man who sells the machine and to the farmer himself. No farmer should feel that he is entitled to a good price for inferior cream. The farmer who supplies good cream is wronged when no distinction is made between his product and that of the careless farmer who delivers spoiled cream. This condition of affairs has existed so long and its burdens have been so heavy to bear by both the farmers and the creamery companies, that a concerted effort has been made by the latter in some States to adopt the graded cream system by which a higher price is paid for cream delivered in good condition, than for that in poor condition. The justice of this will appeal to every one and to none more than the man who sells cream-separators. As it appears to the writer, a crisis in the creamery business is approaching, if indeed it is not already here. When a very large percentage of the product of the creameries must be graded as "creamery seconds" and go into cold storage where it remains without a market, injury, if not disaster, is bound to result to the creameries producing this butter, and through them to the farmers who supplied the bad cream.

Not only is the visitor impressed by the superior quality of the materials and workmanship employed in this great factory, which are not excelled in any factory, but he can not fail to be impressed with the personality of the men at the head of this great enterprise. From President Hennings G.

If you knew for sure that one cream separator is a great deal better—better for you—than all other separators;

If you knew for sure that some one of them would make more dollars for you than any of the others, you'd be pretty sure to insist upon having that one, wouldn't you?

Well, I know that the

Improved Frictionless **EMPIRE**

is the cream separator that will make the least work for you, save you the most labor, give you the least trouble and the greatest satisfaction and make the most dollars for you.

And I want the chance of proving it to you.

You are interested, for when you buy a separator you are just as anxious to get the best as the manufacturers are to sell an EMPIRE.

How am I going to prove it?

It is not an easy thing to do on paper, because every manufacturer and every agent is continually claiming that he has the only cream separator worthy the slightest consideration.

They can use just as strong arguments—on paper, as I can. Between us you are apt to get confused. But you need not depend upon what any of us say.

You can find out for yourself. If you will only examine an EMPIRE you can see how simple in construction it is; you can feel how much more easily it turns; you see how much more quickly and more easily it can be washed, and you can be pretty sure from even a casual examination that it will last longer, give less trouble and require fewer repairs than any other, simply because it is so much simpler in construction.

If you ask any one who has ever used an EMPIRE you can hear all about its good points, for every EMPIRE user is enthusiastic in its praise. That's why so many other people buy the EMPIRE.

I know you will never regret taking a little time to find out the good features of the EMPIRE. I promise you that you will feel it well spent. I ask you to send a postal card to the EMPIRE CREAM SEPARATOR COMPANY telling how many cows you milk and what you do with the milk and they will send some mighty interesting books about dairying and cream separators. Won't you let them do it? Send your name today. Just address

EMPIRE CREAM SEPARATOR CO., BLOOMFIELD, N. J.

311 TEMPLE BLOCK, KANSAS CITY, MO.

A Dollar Game Free

For postage. Send eight two-cent stamps and tell how many cows you keep and what you do with your milk and we will send you the "Game of EMPIRE Success," the most amusing, attractive and fascinating game ever invented. Old and young can play. Bushels of fun for all the family. Handsomely lithographed in colors, mounted on heavy binders' board 12x16 inches.

Get the Empire Books.

6. Dairy Results—Dollars.
7. Money and the Way to Make It.

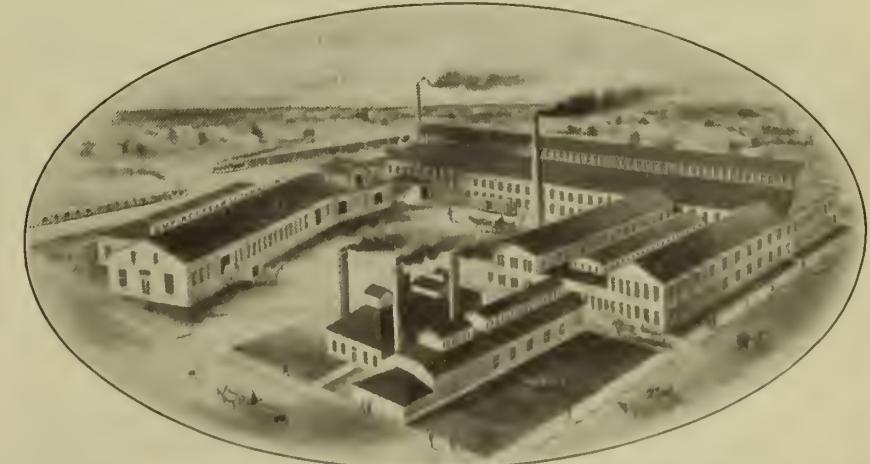

Taube down to the humblest chore boy, the same spirit of accuracy, energy, and honesty, is shown. Perhaps no one connected with the factory impressed the visitors with his personality more than did Ernest E. Bell, secretary and sales manager, who is the real man behind the gun. We take pleasure in presenting a portrait of Mr. Bell, who has made a wonderful record in building up the great Empire Separator Company from its small beginnings of a few years ago. His personality is so strong that it is felt everywhere in and about the factory, and throughout the field force. He is not only a hard worker himself, but he inspires others to do their utmost. Every one of the eighty salesmen who visited the factory on this occasion, went home filled to his capacity with enthusiasm instilled by Mr. Bell and the quality of the machine which he offers to the public. His instructions to these men

A Way to Get Rid of Rats.

EDITOR KANSAS FARMER—I know from experience that plaster of Paris will kill rats and also cause them to leave the premises; but you must use good judgment and management. First feed them cornmeal two or three nights by putting it under boxes with a small opening just large enough to let in the rats, so that they will think they are stealing the food. Then mix about one-half meal and one-half plaster of Paris and put in the same places. You may not kill many but more will be sick, and if one dose will not do the work, give them another. They will soon leave as they are wise little rodents and take for granted that your premises are not healthy for them.

Wabaunsee County. E. THOMPSON.

Fruitful trees are profitable trees to plant. Leaves are not the fruits you plant for when you plant apple- or

General View of the Empire Cream Separator Factory at Bloomfield, N. J.

were brief but full of force. They are simply to "tell the truth about the Empire."

In thinking over this remarkable trip and pondering as to its results, one can not help a feeling of amazement that this company should be willing to incur an expenditure of \$20,000 simply for the purpose of instructing its men by object lessons, and of instilling into them a degree of enthusiasm which must prove practically relentless in their future campaign as salesmen.

This is the Empire way.

Truth doesn't alter or grow old; 2 and 2 made four when Adam was a boy, and it amounts to the same to-day.—Billings.

No, sir! Most any old tree will bear leaves. But you want something besides leaves you want fruit and plenty of it. If you want to be sure that the trees you plant will be fruitful trees, buy them direct from the Gage County Nurseries, Beatrice, Neb. They offer you a "square deal"—that means fruitful trees, true to name, sure to grow, and they guarantee the trees will reach you fresh and bright, and all right. There is some pleasure in planting the kind of trees they send you trees that you know will bear fruit in plenty for your labors. Write for their catalogue to-day, their variety makes it easy to order just what you need.

Horticulture

Douglas County Horticultural Society.

The regular monthly meeting was held Saturday, February 17, at the court-house. The attendance and interest at these meetings is on the increase. J. R. Elevens, the north-side market gardener, being on the sick list, his subject was taken up as a general discussion. A. J. Martin being absent, his subject, "Family hotbed and cold frames," was postponed to the March meeting. A letter from A. N. Deming, who is visiting in California, proved of much interest to those present—it commented upon California landscapes and fruit conditions from a Kansas standpoint.

Mrs. B. F. Smith's paper treated in a unique way "The Toad." The toad should rank next to the bird as the great bug-catcher and worm-destroyer, with appetite always keen; not beautiful nor a cunning pet, but harmless and always helpful. It lives to a great age and is of much value to the gardeners and fruit men. She has had for several years a pet toad which makes its home under the bush by which she throws her table-scrap. It has grown to be of very great size. A never-to-be-forgotten incident in her childhood was the liberation of a half-swallowed toad with which a large snake, with its tail wrapped around a bush, was having an argument. The child and her stick soon closed the career of his wiggleship, and the toad was spared.

At the last meeting, James Means, manager of the cannery, said that there was money in raising asparagus for the cannery, and the society paid close attention to William Miller's talk on "Commercial Asparagus." Mr. Miller has raised this delicacy in the garden since 1858, and commercially since 1881. He has an acreage of 3½ acres and said that it would be impossible to plant eight or ten acres for the cannery-factory unless it was done upon a specific, long-term contract, as it took six years to get the beds in full bearing and cost an outlay of at least \$200 per acre, a prohibitory outlay on uncertainties. A very low price could be made because everything, big and little, would be taken by the cannery and there would be no expense of sorting, bunching, and weighing. Owing to the floods having washed out beds on the bottoms, it had been a profitable crop for a year or two past, but new acreage was now being planted. A bed is good for twenty to twenty-five years.

He said the secret of success in commercial growing was to plant the whole tract at one time, not cut any the first two seasons, and after that every third day, cut every scrap that showed above the ground. This kept down the two great pests; the beetle which lays its eggs upon the young stalk just breaking through the ground; also a black fly that stings the stalk near the ground, causing hundreds of pounds to be rejected. Every stalk is kept cut until June first to tenth, then the growth is allowed to take the bed and the weeds are kept down with cattle from time to time. There are two kinds of plants, male and female. The male plant sends up but few stalks, but these are very large and fine. The female plant sends up a great clump of small stalks, and besides sheds seed; and for this reason nearly all of the female plants should be rejected in planting out a new bed. Asparagus should be set on a south slope on warm, sandy loam; plow ten inches deep and subsoil; rows should be four to five feet and plants 3½ feet apart in row. Plant as deep as eight inches. The bed should have fifty loads of manure to the acre each year. Disk and cross-disk in the spring. An acre will yield from 1,500 to 3,000 pounds after the sixth year, and will then have cost \$200 per acre to establish.

Forrest Savage, an old settler, spoke of watermelons on sod, supposedly the settlers' first crop. Coming here in 1855 he said the diet of the first comers consisted of quail, fish from the streams, and in the fall wild geese and ducks. In winter the main provision was buffalo meat. The fruits were wild plums and grapes, blackberries, paw-paws, hickory and walnuts. The first year from planted gardens single sweet potatoes were dug two feet long, and a single Irish potato would make a meal for a family. His favorite watermelon was the Washington, long, stripe, and spotted like a snake. The melons "on sod" were truly superb. Then this old gentleman, well along in his eightieth year, went into ecstacies

FARMER

describing the charms of the "Prairie Sod Girl," also a product of those times.

W. E. Barnes, of Vinland, the largest orchardist in the county, then spoke of his first planting of fruit-trees from Massachusetts in 1857. In 1860 he planted pears, apples and grapes. At that time he obtained the Missouri Pippin from Missouri and planted it. It blossomed in the second year and gave the first home-grown crop of apples in this county in 1863. This encouraged others to plant. In the fall of 1868 he planted an orchard of 4,000 trees, seven hundred of them being Missouri Pippin—these latter alone paid all the cost of the orchard. There were no codling moths previous to '69. They came with shipped-in fruit. His best crop was in 1883, which sold in bulk at \$2 per barrel. No fungus nor bitter-rot at that time. It came about 1887. Between 1883-85 his first planted apple-trees began to decline. Mr. Barnes believes in and practices spraying.

W. E. Koehring was drafted without notice to take up "The Kitchen Garden." This he did in a thorough and pleasing manner. He believed in taking lots of risk from frost in extra early planting. His subject was well worth reproducing at length.

G. W. M.

Rhubarb.

A. N. H. BEEMAN.

Rhubarb, or pie-plant, as it is commonly known, is one of the most healthful, one of the most easily grown, and one of the most valuable of garden vegetables. It is of such importance and real value that it ought to be more generally grown. A good thing, so easily gotten, so easily grown, ought not to be so infrequently found and used in our farm and even our city homes. There are a great many valuable and wholesome vegetables, but rhubarb stands without an equal in its class. It is one of the earliest vegetables of springtime. Its strong, vigorous leaf stalks, so crisp and brittle, push themselves from the cold ground into sunshine and air. The whole plant reflects of inborn strength, vigor, and freshness. Its uses are many and it can be prepared easily for table use. There is nothing like rhubarb pie or sauce in the early spring months. There are but few things with the same tartness or acidity, wholesomeness, and palatability, as has rhubarb.

A small bit of ground is large enough to grow enough plants—ten to twenty—for an ordinary family. Most city homes, and at least all farmers, have some small plot or corner of ground, perchance unoccupied or in weeds, which might well be planted to rhubarb. A good, moist, deep loam, thoroughly enriched with well-rotted barnyard manure, is an ideal soil for rhubarb. Plants may be grown from seed, but "roots" or "crowns" are usually used. Seed should be sown in early spring, say in April. The second season's growth usually furnishes some stalks large enough for use. An ounce of seed will sow from 100 to 125 feet of rows. In about eight weeks after sowing the plants should be thinned to about eight inches, or transplanted in temporary rows. The following spring they should be transplanted to their permanent places, setting them three or four feet apart in rows that are four feet apart. Cultivate throughout the season, and give the ground a covering of good barnyard manure in the fall. The leaves can be pulled until the first of June or July, depending upon your wants and needs, and upon market demands to a degree. But pulling should cease early enough so that the plants will be able to make a good growth before fall. Unless seed is desired, which is rarely the case, cut the flower stalks as they appear. The original plants will last for a number of years, but it is best to divide the crowns and make a new settling about every fifth year.

The full value and utility of rhubarb has not been fully realized until recent years, when it has been forced. But few of our common vegetables are so well adapted for forcing. Because of the marked ease of forcing, we can secure this vegetable in a more attractive and equally valuable form in midwinter or later than we can from outdoor planting. The forced product is of the highest quality. It can be forced in light or darkness. It is not exacting as regards a definite degree of temperature, which may vary from 45° to 70°. The lower temperatures are best, producing stalks more crisp and with less acid. Rhubarb can be forced in a cellar, in a box, even in the kitchen, or in well- or poorly-constructed forcing-houses. It is perhaps most

As a premium to introduce our seeds into every household, we will also send a collection of fine beautiful bulbs FREE with Catalogue. Somerville Nursery, SOMERVILLE, MASS.

SEED CORN

There are many points to be considered in selecting seed corn; some of the most important are outlined in the above order, namely, well filled out at butt end with small to medium sized shank; the tip of each kernel exposed or covered over with fair sized grain; the kernels should be wedge shaped from cap to where it rounds off at point or germ end, and the rows should close together but still not so tight as to smother the germ and cause mold. The grain must be deep and set on a small cob which is of such texture that it will dry out easily and quickly. These points are all brought the nearest to perfection in the new

GOLDEN WEST It is the most desirable, large, bright yellow corn ever sent out and it will pay you well to try it. The Best Fruit Paper

In The Fruit-Grower, published monthly at St. Joseph, Mo. The regular subscription price is a dollar a year, but if you will write for free sample copy and mention this paper, you will receive a proposition whereby you may secure it one year WITHOUT COST. Every one who has a few fruit trees or a garden, should read

THE FRUIT-GROWER
ST. JOSEPH, MISSOURI

Every issue is handsomely illustrated and from 32 to 64 pages a month are filled with interesting matter pertaining to fruit growing and gardening. The first four issues of 1906 will be the following subjects—January, The Horticultural Society; February, Spraying; March, Gardening; April, Small Fruits. Any one of these numbers will be worth a dollar to you. We publish the "Brother Jonathan Series" of fruit books. Send your name and address and we will tell you how to secure these books free.

TRADE MARK
BRO. JONATHAN

Fruit-Grower Co. 169 S. 7th, St. Joseph, Mo.

(Continued on page 311)

commonly forced in low, double-spanned, roughly- and cheaply-constructed houses. An excavation two to three feet deep may be made and arched over with a roof of boards or logs, covered with hay, straw, or fodder, and the dirt of the excavation thrown over the entire roof. No particular facilities are necessary for ventilation. Unless in a severely cold winter, the house can be heated by use of ordinary heating stoves. In more expensive houses, and in case of extreme cold, a system of hot water or steam heating would undoubtedly be advisable.

Good, strong, two-, three-, or four-year-old plants are used in forcing. The plants to be used are dug in the fall, and with their adhering soil left in the field and covered with enough soil to prevent drying out. It is best to leave them there until they have been frozen through. About the first of January—earlier or later as the case may be—the roots still retaining their soil are brought into the forcing-house. They are set or packed close together on the moist dirt floor. Moist soil, preferably a rich one, is filled in about each plant, covering the crown slightly. After they are once thus packed in they may not need watering, but the roots and soil should not be allowed to become dry. Only strong, vigorous plants will produce the large, thick stalks, eighteen to twenty inches high. When properly grown, the forcing-house product is attractive, of delicate color, tender, and of excellent flavor. After the plants have produced this winter crop of leaves, they will have become exhausted and are of little or no value for any purpose in the future.

But two varieties are commonly grown—Linneus and Victoria. A new and supposedly better kind, introduced by Burbank, is called the New Crimson. The Victoria is a late variety of excellent quality, bearing large, thick leafstalks. Linneus is also a large, tender and desirable sort, but it is earlier than Victoria.

Winter Vegetables.

F. P. RUDE, BEFORE SHAWNEE COUNTY HORTICULTURAL SOCIETY.

To have all kinds of vegetables for next winter you must begin to plan for them now, and include such seeds in your seed-list as will be needed for spring and summer planting. The soil should be good and well fertilized and should have good cultivation in proper time.

CABBAGE.

The seed of late varieties should be sown the middle of May, and the plants set about June 20. A part of this may head too early to keep for winter, and it can be made into kraut or sold. Let the cabbage for winter use remain in the garden until there is danger of freezing, then pull it up with all of the leaves on and dig or plow a trench wide enough to set two or three heads side by side, heads down and roots up, and cover with six inches of dirt. Leave it this way until freezing weather begins, then add another covering of litter of some kind, or long manure, and you will have the cabbage where you can get at it all winter through, and it will be fresh and crisp.

CELERY.

The seed should be sown the first of April in a well-prepared seed-bed in the open ground. If the weather is dry, the bed should be sprinkled and kept moist until the seed germinates. Keep the plants free from weeds and well cultivated until they are large enough to set out in the row where you want them to grow. The first to the middle of July is the time to set celery for winter use. Rows should be four feet apart, and the celery set six inches apart in the row. Commence to cultivate immediately and keep cultivating. Celery can be grown without water, but the more water used the better the celery. As the celery gets well grown it should be handled, that is, the soil should be pulled up around each plant to make it grow more upright.

Storage.—Let your celery grow as long as you can in the fall, until the nights begin to get frosty, and then it is time to store it for winter and to bleach it. The best method is to dig a trench one foot deep, two or three feet wide, and as long as needed. Line the sides of the trench with boards, take up the celery when the leaves are dry with as much soil on the roots as possible, and pack as closely as possible in the trench, using fine, moist soil to pack the roots in, as though you were setting it out to grow again; and if the soil is dry, use water enough so

Great American Desert Seeds

are best for general use, are grown in the very heart of the region once known as the Great American Desert, at an altitude of over two thousand feet above sea level and without irrigation. They are time tried and drouth tested and have proved producers of profitable crops of both grain and forage. Write for list of specialties and prices.

Ratekin's Pride of Nishna Seed Corn

"Pride of Nishna" is a golden yellow, 16 to 24 rows; deep grains and small cob; matures in 95 to 100 days; of great vitality and strength to resist drouth and other unfavorable conditions, making from 80 to 100 bushels per acre. "Ratekin's Iowa Silver Mine," white, has made the greatest record for large yields of any white corn in the world—averaging 178 bushels per acre in seven states; full counterpart of "Pride of Nishna."

Our Seed all grown by us from absolutely pure stock, especially for seed purposes. All carefully selected, sorted, and butt and tip ends taken off and graded to uniform size. Seed shelled and graded or in the ear. Change your seed while you can get the best; grow bigger and better crops. Price, \$1.25, shelled, sacked, on board cars here; 10 bu. or more, \$1.25. Our big Illustrated Catalog of all Farm and Garden Seeds mailed FREE if you mention this paper. Write for it today.

Address, RATEKIN'S SEED HOUSE, Shenandoah, Iowa.

The Poultry Yard

The Orpington Breed of Fowls.

The Orpington breed of fowls was produced by the late William Cook, of England. The Single-comb Buff Orpington is the most popular of the ten varieties. They were produced in 1894, after ten years of persevering work, by crossing the Golden Spangled Hamburg cock with a dark Dorking pullet. The progeny from this cross were mated to a Buff Cochin cock from a noted laying strain. Not only are the Orpingtons noted for their laying qualities, but they are excellent table birds and of handsome appearance. The weight of cocks is from eight to ten pounds. Hens weigh from six to eight pounds. The hens make good mothers; though large, they are active, not tramping on the young or breaking the eggs while sitting. They are fast growers, mating early, and when we are looking for a breed for profit on the farm, the Orpington fills the bill for layers and weighs heavily when we take it to market. Mrs. J. R. Cotton, Neosho County.

Poultry Pointers.

The severe cold weather of the past week has been very trying to young chicks just hatched and their owners should be careful to see that they are well protected from the weather. A stunted chicken never amounts to much, and it should be the object of the poultry-raiser to see that it grows right along without any severe setback. The earlier you can get chickens hatched the better—provided you see to it that they are properly protected when sudden storms and blizzards arrive.

Should the combs of some of your fine birds get frosted these cold mornings, the best remedy is to rub briskly with glycerine.

Nearly all poultry diseases are caused by either cold, dampness or want of cleanliness. Sometimes it comes from bad feeding. Neglect somewhere is the cause of all the disease. It is easier to guard against disease than to cure it. It is always unsatisfactory to treat sick birds, and the old adage, "an ounce of prevention is better than a pound of cure," applies most pertinently to poultry diseases.

While you are cleaning up don't forget the nest boxes. No portion of the hen-house fosters more vermin than the nest. Remove every particle of the material and burn it up, replacing with nice fresh straw or hay. If the nest is removable, take it out and saturate well with coal-oil.

If you should happen to break your incubator thermometer, you can get a new one by sending 75¢ to Thos. Owen, Station B, Topeka, Kansas.

Many a breeder of fine stock has ruined his herd by crossing and mixing, and the same is true of poultry. Select the breed that suits you and then stick to it. Don't experiment by crossing; let the other fellow do that. And if, after a great outlay of time and money, he evolves something that is better than you have, you can get it from him cheaper than it would cost you to produce the same thing.

Poultry Notes.

N. J. SHEPHERD, ELDON, MO.

Save the eggs from the best laying hens, but be careful to have such hens in company with a pure-bred cock; and if he is the son of a good laying hen, the pullets hatched, being sired by him, will be good layers as compared with breeding from all kinds of fowls.

If a hen needs food of a nitrogenous nature and she is fed that which is deficient in nitrogen, her hunger is appeased for a time, at least, and warmth provided for her body, with perhaps enough of the elements required to repair waste of tissue, but not enough to supply her with the extra materials for producing eggs. Hence the hens may in one sense be well-fed and yet not lay.

Perhaps the most attractive goose is the Embden. While not so large as the Toulouse, the difference in size is very little. The Embden, however, is entirely white and makes an attractive appearance in market, while the feathers bring a better price.

If the breeder wants to keep up the vigor of his stock, he should never make a practice of breeding from pullets. The best breeders are hens in their third year, mated to a cockerel or cock one year younger than the hens.

Marking the chickens has two advantages: one is in being able to know

POULTRY BREEDERS' DIRECTORY.

BLACK LANGSHANS

Good Calves and Poor Ones

You can't grow a big bodied, productive cow, or a large fat steer from a calf that won't eat. If you supply sufficient and proper ration, Dr. Hess Stock Food in tablespoonful doses, will do the rest. It gives hearty appetite, and perfect digestion, so that the calf takes on increased growth and is kept free from disease.

DR. HESS STOCK FOOD
A TONIC

makes your stock healthy and hungry—and what they eat Dr. Hess Stock Food compels them to digest and put to proper use. It is the prescription of Dr. Hess (M.D., D.V.S.), containing tonics for the digestion, iron for the blood, nitrates to expel poisonous materials from the system, laxatives to regulate the bowels. The ingredients of Dr. Hess Stock Food have the endorsement of the Veterinary Colleges and the Farm Papers. Recognized as a medicinal tonic and laxative by our own Government, and sold on a written guarantee at

5c. per lb. in 100 lb. } Except in Canada
sacks.
25 lb. pail \$1.60. } and Extreme
West and South.
A tablespoonful per day for the average hog.
Less than a penny a day for horse, cow or steer.
If your dealer cannot supply you, we will.

DR. HESS & CLARK,
Ashland, Ohio.
Also Manufacturers of Dr. Hess Poultry Pan-a-ee-a
and Instant Louse Killer.

Sick Headache

When your head aches, there is a storm in the nervous system, centering in the brain.

This irritation produces pain in the head, and the turbulent nerve current sent to the stomach causes nausea, vomiting.

This is sick headache, and is dangerous, as frequent and prolonged attacks weaken the brain, resulting in loss of memory, inflammation, epilepsy, fits, dizziness, etc.

Allay this stormy, irritated, aching condition by taking Dr. Miles' Anti-Pain Pills.

They stop the pain by soothing, strengthening and relieving the tension upon the nerves—not by paralyzing them, as do most headache remedies.

Dr. Miles' Anti-Pain Pills do not contain opium, morphine, chloral, cocaine or similar drugs.

"Sick headache is hereditary in my family. My father suffered a great deal, and for many years I have had spells that were so severe that I was unable to attend to my business affairs for a day or so at a time. During a very severe attack of headache, I took Dr. Miles' Anti-Pain Pills and they relieved me almost immediately. Since then I take them when I feel the spell coming on and it stops it at once."

JOHN J. McERLAIN,
Pres. S. B. Eng. Co., South Bend, Ind.

Dr. Miles' Anti-Pain Pills are sold by your druggist, who will guarantee that the first package will benefit. If it fails he will return your money. 25 doses, 25 cents. Never sold in bulk.

Miles Medical Co., Elkhart, Ind.

Farmer's Account Book and Ledger

Care of Young Pigs.

I give you my mode of care and treatment of young pigs; First, I wish to give the way I feed and care for them. I feed my sows on a bulky feed and keep the bowels in proper condition. I bed my farrowing pens about a foot deep with straw. I long ago got over the idea that a basket of cut straw is bed enough for a sow at farrowing. If the sow has not bed enough, she will get up every little while and paw and scrape at her bed, to get it up together, trying to make it soft so she can rest; but if she has plenty of bed, she will lie down and be quiet for many hours and will not kill as many pigs as a sow that has not enough straw to make her bed comfortable.

I feed my sows all the bran, corn, oats, and slop they want just before farrowing; I want the stomach full at this time. I put water in a trough where they can get it when they want it. About the second day I give them a feed of roots, as I generally have some beets for them. I feed them roots for a week, when I give them a little slop made of bran, corn, and oats, or something of that kind, and increase the feed as the pigs grow stronger. When they are three or four weeks old and pull on the sow, feed all she wants; as soon as the pigs need it I feed them in a low trough where the mother can not bother them. In this way I am quite successful. Of course, the bed should be kept in good condition.

I think scours is the most prevalent disease among young pigs, and for this I have no remedy. I have not been bothered with scours among my pigs for six or seven years. I used to feed many things for scours, and I was very successful in producing them, too. I fed nearly everything I saw recommended as being good for scours, and I think I was as successful in producing scours in pigs as any breeder I ever saw. My last experience with the disease was in 1887. I had a very fine litter of six pigs. I was feeding for the scours and the pigs had it very bad. At last I tried giving the pigs laudanum (they were perhaps two weeks old). I put it in water and gave them a little—I think less than one drop each; I gave five of them laudanum and they went crazy in a few minutes; they never sucked or laid down after that; they traveled for hours and died; I killed the last two to get them out of their misery. I did not give the sixth pig any; I quit feeding the sow and she got all right in a few days and lived to make an extra good hog. I quit feeding for scours then, and have fed for health and thrift since, and have been equally as successful in obtaining it; for I have not been bothered with scours since then.

Now, I believe nearly all the trouble of scours in young pigs is brought on by overfeeding the sow. I know how anxious a breeder generally is to push his pigs along; I know how many young breeders feel. They have bought a good sow or two, to start a herd, and they are going to give them special care and push their pigs from the start and make some extra good ones of them. I read that we should feed but little the first few days after the sow farrowed, and I tried it; I gave a little slop to my fine sows, when the pigs were but a few hours old. I could not call the sow out of bed, so I would drive her to the trough and get her to take just a little good slop, then she would go back and lie down; next morning I would drive her out to get just a little more good slop. I gave her but little, but that little was more than she wanted! So it went on. Now, if I had not been in such a hurry to feed that little slop, I would have had less trouble. Scours is the result of improper feeding of the sow, and if the sow is properly fed there will be no scours among the pigs. My guard against this trouble is to not overfeed the sow. If my sows farrow when there is grass for them, they are not fed any grain or slop for a week or ten days, but have all the grass they want.

A friend of mine in Illinois, once

quite a noted breeder of Berkshires, had the best litter of pigs he ever bred killed by an inexperienced man's feeding the sow five ears of corn. This sow was the sweepstakes sow at the Illinois and Iowa State fairs in her day. She was the dam of the first sow recorded in the American Berkshire record. She had her litter of five pigs by a fine imported boar. The breeder gave this man special orders not to feed this sow anything—that he would see to her himself.

All went well till the pigs were a week or ten days old, when he went one morning to her pen and she was just cleaning up a feed of corn. He asked his man why he had done this, and he said she was hungry and he only gave her five ears. She was not used to having corn, and my friend said to him: "You have killed this fine litter of pigs." He commenced then and there to try and save the pigs from the effects that were sure to follow. The corn fevered the sow's milk although he began at once to try to save the pigs; four of the pigs died and he raised the fifth pig only by taking it away from the sow and raising it by hand.

This I relate only to show what effect sometimes follows such changes, and to impress on the minds of the readers that such things should be guarded against.

The next trouble with young pigs is thumps. This trouble comes from the pigs getting too much milk and taking too little exercise. If the weather is bad, the pigs are apt to stay too much of the time in the bed and get too fat. When there is danger of this kind it is well to force the pigs to take more exercise, or keep them away from the sow part of the time each day, which will shut off their feed and they will take exercise trying to get back to the sow.

The next trouble with pigs is canker-sore mouth. I have not been bothered with this trouble, however. To doctor this, swab out the mouth with a solution of carbolic acid and borax.

A few years ago I had a sow that had a litter of ten fine, strong pigs; in a few days these pigs began to have very sore mouths and eyes; several of them went blind. I looked for the cause of this trouble and I found it to be in the bad. I had some old hay that was full of ragweed; I ran a lot of this through the cutter and gave the sow a bed of it. The result was that the dust and blossoms from the ragweed made the eyes and mouth sore. Four of this litter died and three of the others were blind for about two weeks and were badly stunted. I do not use litter for bedding now that has much ragweed in it; that is the only time I ever tried it.—Veteran Breeder, in American Swineherd.

Prevent Lying on Pigs.

H. D. Compton, Annes, Kan., tells the American Swineherd how he protects the pigs at farrowing time. He says:

There are several things to be taken into consideration in dealing with this question.

1. If your sow is of a cranky disposition you are up against a hard proposition.

2. If she has been improperly fed and handled during pregnancy, she will naturally be restless, thrash around a great deal at farrowing time, hurt some of the pigs and make them squeal; then she will get up and proceed to make her bed over again and when she lies down again the chances are you are minus several pigs.

Again, pigs from old sows have exceedingly sharp tusks, and if they are not cut off they will cause the sow to kill more or less of her litter. If you want to see a scrap to a finish, notice the actions of the second litter of pigs from a sow that was permitted to raise only two or three pigs at the first litter. The teats those pigs sucked will be developed and have more milk in them, and the way the second litter of pigs will fight for those teats is a caution. Therefore, a sow of that description is practically ruined for a brood sow. She will never raise a nice, even litter of pigs.

So much for and against the sow. Now for the farrowing pen.

I have been in the hog business a good many years, have tried all kinds of pens, from the rail pen covered with straw or hay with a dirt floor, to the double hoghouse with board floor and roof, but have never found anything the equal of the A-type farrowing pen with board floor. Of course it is wise to take all the precaution you can to save the little fellows, hence I always put in fenders.

Just before the sow is to farrow (and all hog men know pretty nearly when that will be—if they don't they are not hog men), raise the front of the house a little, the object being to compel the

sow to lie down with her back from end of pen, as all stock when given their freedom always lie down with their back or head up hill, never the reverse. Should she lie down with her head up hill her back will be against the roof, which, owing to construction of the same, affords pigs a nice runway behind the sow.

Docking Horses.

EDITOR KANSAS FARMER:—What is the law in France about docking horses? Are all the horses fit for breeding purposes docked? In my neighborhood there are imported horses and some are docked and some are not.

W. M. HARSHBARGER,

Lincoln County.

This inquiry was referred to Col. J. W. Robison, of Eldorado, whose experience among the horse-breeders of France as well as his wide information from other sources makes him probably the best authority in Kansas. Colonel Robison replies as follows:

"I do not know of any law in France about docking, but it is the practice there to dock horses used either for work-horses, or for breeding-purposes, except some that are left especially for the American trade, to be exported to this country while they are still young.

"All the horses are usually docked whether used for saddle, harness, or work, and the work-horse is usually left entire.

J. W. ROBISON."

The Oklahoma Meeting and Sale.

During the week ending March 17 there was held the annual sale and special meeting of the Oklahoma Improved Stock Breeders' Association. This was the second annual exhibit which is called The Midland Live Stock Show. The association had provided most desirable quarters for its exhibit and sale at Colcord Park adjacent to the city and on the street-car line. There were more than 300 animals on exhibition contributed by the following well-known breeders.

Shorthorns.—S. T. Snodgrass, Gordon, Kansas; Fred Case, Harrisonville, Mo.; S. B. Findlay, Oklahoma City, Joseph Lyons, El Reno, Okla.; Harriman Brothers, Pilot Grove, Mo., Agriculture College, Stillwater, Okla., E. V. Johnson, Lexington, Okla., Frank B. Bouger, Lexington, Okla., D. E. Alkire, Lindsey, I. T., W. E. Williamson, Moore, Okla., W. S. Combs, Yukon, Okla.

Herefords.—S. L. Brock, Macon, Mo., R. W. Morrison, Calumet, Okla., T. E. Smith, Rolland, Okla., S. B. Finland, Oklahoma City.

Galloways.—S. M. Croft & Sons, Bluff City, Kans., G. M. Kellam, Richland, Kans., W. G. McCandless & Sons, Cotterton Falls, Kans., Geo. E. Cole, Topeka.

Jerseys.—C. E. Perfett, Golden, Colo., E. Bracht, Oklahoma City, Okla., S. J. Conner, Oklahoma City, Okla., Horace McBeth, Oklahoma City, Okla., W. B. Atchison, Hinton, Okla., University of Langston, Okla.

Aberdeen-Angus.—Parrish & Miller, Hudson, Kans., Geo. Kitchen, Jr., Dower, Mo., William J. Turpin, Carrollton, Mo.

O. I. C. Swine.—Casey & Vincent, Pawhuska, Okla., R. B. Gill, Oklahoma City, Okla.

Poland-Chinas.—W. S. Combs, Yukon, Okla., J. R. Gilliland & Son, Hart, I. T., W. E. Williamson, Moore, Okla.

Duroc-Jerseys.—Jos. Durrall, Billings, Okla., S. Young, Mustang, Okla., J. L. Holes, Oklahoma City, Okla.

During the week the Territory was in the grip of a blizzard which served to reduce the attendance very considerably and the prices realized at the pure-bred sales were somewhat disappointing. The Shorthorn sale was fairly well attended though the prices were not up to expectation. The crowd in attendance at the sale of the other breeds were all smaller and part of the sales ad to be abandoned.

The Shorthorn sale.—Fifty-three shorthorns were sold for \$5740, an average of \$108.40. The top bull of the sale was Doctor Archer 217445 who went to Sanford Smith, Carthage, Mo., for \$25. He was contributed by Harriman Brothers, Pilot Grove, Mo. The top cow was Lovely Bud contributed by Fred Case, Harrisonville, Mo., and sold to W. B. Combs, Yukon, Okla.; for \$500.

The Hereford sale. Twenty-two Herefords sold for \$1960, average \$89.10. The top bull of the sale was Distancer 204803 consigned by S. L. Brock, Macon, Mo., and sold to F. M. Gault, Oklahoma City, for \$200. The top cow was Julianne 120131 consigned by Walter B. Waddell, Lexington, Mo., and sold to Lawrence Rodke, Paoli, Indian Territory for \$150.

Only two head of Aberdeen-Angus cattle were sold as there seemed to be no buyers present. These two brought an average price of \$53.50.

But four galloways were disposed of and these averaged \$44.00 per head.

Thirty-nine head of Poland-Chinas sold for \$958, an average of \$24.56.

Only eight head of Duroc-Jerseys were sold and these brought \$238, an average of \$28.75.

Officers of the Oklahoma Improved Live Stock Breeders' Association were elected for the ensuing year as follows: President, E. Breacht, Oklahoma City, Okla.; vice-presidents, E. T. Alkire, Lindsay, I. T., W. W. Wyatt, Yale, Okla., W. S. Combs, Yukon, Okla., J. A. Paulin, Newkirk, Okla.; secretary, treasurer, J. A. Alderson, Pond Creek, Okla.; assistant secretary, F. D. Northrup, Oklahoma City, Okla.

Officers of the Oklahoma Shorthorn Breeders' Association were elected as follows:

President, E. E. Alkire, Lindsay, I. T., Vice-presidents, J. A. Alderson, Pond Creek, O. T., W. S. Combs, Yukon, O. T.

E. P. Connelly, Wellington, O. T., Calvin Dean, Newkirk, O. T., C. H. McAllister, Carmen, O. T.

Secretary-Treasurer, F. B. Linday, Oklahoma City, O. T.

The next meeting and sale will be held early in February, 1907.

The Two Days' Auction of High Class Herefords.

On April 4 and 5 there will occur at Kansas City, one of the most interesting Hereford sale events that has been held there within recent years. Gudgel & Simpson, Independence, Mo., consign three bulls and seven heifers that represent the type, character and quality for which this herd has become famous. They are intensely bred in that greatest of all Hereford strains of the present day, the Anxiety 4th, and are sired by Dandy Rex, Beau Dandy, Militant, Paladin, and Beau Donorus. Scott & March, Belton, Mo., consign three heifers and two bulls sired by Hesiod 29th and his son Majestic. Other sires represented in this consignment are March On, a son of March On, and Columbus 26th, a son of the noted Columbus. Dr. James E. Logan, Kansas City, Mo., consigns ten head consisting of three bulls and seven cows and heifers representing a concentration of the blood of the noted bull, Imp. The Grove 3d. They are sired mainly by St. Grove, a son of the noted bull St. Louis; Chester a son of Imp. Chesterfield; and Duke of Cumberland a grandson of Lord Wilton. A full list of consignors to the April 4 auction will be found in the advertisement in this issue, and the catalogue will reveal the fact that such noted sires are represented as Pathfinder a son of Imp. Improver; Bright Rex by the champion Dandy Rex; Governor Simpson a son of Lamplighter; Headlight tracing on side of both sire and dam to the most noted of Anxiety 4th bulls; Shadeland Dean 22, a celebrated sire; Sensation by Columbus 17th; Perfection Yet a son of the Champion Perfection; and Prince Improver by Improver.

In addition to the ten head that Dr. James E. Logan includes in the combination auction on April 4, he will also sell fifty head of exceedingly good ones on April 5. He catalogues nineteen bulls and thirty-one cows and heifers all of which are strong in the blood of the celebrated bull, The Grove 3d, imported by Mr. Culbertson and sold to head the great Shadeland herd of Adams Earl, at \$7,000, the highest price of that day for a bull of the breed. Dr. Logan's cattle are in the pink of condition and numbered among them are animals that could successfully compete at our great breeding shows. He has always purchased the best and has carefully bred them and cared for them and such an offering is what might be expected from such selection of foundation stock and such care in handling them.

One hundred and eight head of excellent cattle are catalogued for this two days' sale, consisting of forty-three bulls and sixty-five cows and heifers. Numerous high-class herd-headers are included and those in search of Herefords of either sex should not miss this event. Catalogues can be obtained by addressing C. R. Thomas, secretary, Kansas City, Mo., or W. C. McGavock, sale manager, Springfield, Ill.

The Ashcraft Shorthorn Sale.

On April 10, at the home farm near Atchison, Kansas, A. M. Ashcraft will hold a public sale of Shorthorn cattle of unusual merit. Mr. Ashcraft is an old time breeder who has spent years in building up one of the good herds of Shorthorns in the West, and his offering will be well worth going after. His sale will include 42 head of which 27 will be choice cows and heifers. These are dark red in color and very like their sire, Harmony's Knight 218509. There are also to be sold 15 bulls ranging from short yearlings to 2-year-olds. These are mostly sired by the same bull and have his short-legged, blocky, beefy characteristics. The cows and heifers in the sale have all been bred to the good Scotch bull Scottish Minstrel 234970 by Imported Scotch Mist. Free transportation will be furnished to all who call at Carter's livery barn in Atchison and every effort will be made to make the buyers comfortable.

Remember the date and be present or send your bids to either of the auctioneers. You can not afford to miss this sale.

The Nevius Sale of Shorthorns and Poland-Chinas.

C. S. Nevius, of Chiles, Kansas, held a sale of Shorthorn cattle and Poland-China swine at his farm near Chiles, Kansas, on March 12. The weather had been cold for some time and the day was uncomfortable. Good Poland-China breeders were therefore not in attendance in large numbers because they could not be induced to leave their farrowing sows in such weather. Thirty-four Poland-Chinas were sold in the forenoon for a total of \$790, an average of \$23.23.

Nearly all the purchasers of Shorthorns came from a distance and were able to secure bargains without number. Many of Mr. Nevius' show animals were included in the sale. The prices, however, did not run high and the owner thought it necessary to stop the sale after 31 head had been disposed of. The buyers seemed willing to take more animals at prices even with or slightly above the average of the sale. The top price for bulls was \$400 paid by J. H. Tough, of Lawrence, Kansas, for Happy Knight 223939 by Gallant Knight 124468, the great herd bull of T. K. Thompson and sons' herd. The top price for females was \$260 given for the Marr Emma heifer, Emma 20th, who went to J. W. Lamb, Holton, Kansas. The 2-year-old heifer, Rosa Sterne 11th, by Gallant Knight, sold to J. L.

Stratton, Ottawa, Kansas, for \$210, and a yearling heifer Knight's Lustre also by Gallant Knight sold for \$200 to C. J. Woods, Chiles, Kansas, who has the best herd of Polled Durham cattle in the West and who by this means will infuse some new blood from the best of Shorthorn families into his herd. The general average made on the sale was \$116. The females averaged about \$111 and the bulls averaged \$121.50.

Among the buyers were the following: J. S. Tough, Lawrence, Kans.; O. O. Wolf, Ottawa, Kans.; Brown Bros., same; J. L. Stratton, Ottawa, Kans.; J. W. Lamb, Holton, Kans.; C. J. Woods, Chiles, Kans.; H. M. Hill, La Fontaine, Kans.; Wm. Nevius, Chiles, Kans.; C. P. Shelton, Kans.; J. W. Harvey & Son, Maryville, Mo.; Joseph Porter, Ottawa, Kans.; E. R. Barker, Hillsdale, Kans.; J. N. Moody, Louisburg, Kans.; S. K. Trail, La Cygne, Kans.; W. J. White, Osawatomie, Kans.; Henry Prothe, Paola, Kans.; Bartlett Boice, Springhill, Kans.

Shorthorns at Fredonia.

S. C. Hanna, Howard, Kans., H. M. Hill, La Fontaine, Kans., E. S. Meyers, Chanute, Kans., and O. E. Morse and Son, Mound City, Kans., have combined the best animals in their herds in a sale to be held at Fredonia, Kansas, on April 13, under the management of H. L. Bachelder, Secretary of the Southeastern Kansas Improved Breeders' Association. The names of these consignors alone are enough to insure a good offering. Each of these men has contributed the best he has in his herd, and the offering at this sale will be an extraordinary one and the prices ought to run high. Animals sired by some of the best known Scotch and Cruickshank bulls are included as shown by their advertisement on another page. In quality this will undoubtedly be the best offering ever made by this association and one of the best to be made in the West this year. Mention the KANSAS FARMER and write to Mr. Bachelder or either of the consignors for catalogue.

Kansas Is It.

At the recent annual meeting of the Standard Poland-China Record Association, Kansas was given first place on the official roster for the next year. A. B. Garrison, of Beattie, Kansas, was elected president. The board of directors and other officers elected are as follows:

W. T. Garrett, Maryville; F. P. Robinson, same; E. E. Axline, Oak Grove. The balance of the board chosen were: E. R. Woodford, Shenandoah, Ia.; John Blain, Pawnee City, and S. McElveen of Fairfield, Neb.; and C. F. Hutchinson, of Belaire, Kans.; Geo. F. Woodworth of Maryville, Mo., was again chosen secretary, and C. D. Bellows treasurer, W. T. Garrett, president of board of directors.

Do Healthy Animals Need a Tonic?

This question is often raised among stock feeders when considering the use of stock foods. They ask the question, "Does a person in health need medicine?"

It is probably true that if stock were fed for the same purpose that the human being is nourished, there would be no occasion for the use of medicinal tonics under ordinary conditions.

We have most of us learned by experience the evil of over-eating, and endeavor to select foods most agreeable to our digestion. Furthermore, we exert an effort to consume only sufficient food to sustain life and repair waste. In fact, we do not aim at putting on weight, and in many cases just the opposite is hoped for, but if the cow, steer or hog would be given only sufficient food to sustain life and repair waste, no gain would be perceptible; we fully realize that the food consumed that doesn't produce additional weight or milk is entirely wasted, the profit, therefore, being derived from the food consumed in addition to that which is required to sustain life and repair tissue.

Over-feeding therefore, is a necessity, and the results similar, as in the case of the human. Then again, the animal has not the opportunity of selecting the foods most suitable to its digestion.

Medicinal stock-tonics, therefore, must be entitled to a place in the economy of skillful feeding, and the stock preparations that contain the ingredients that have been tested in the medical institutions of our country and found valuable, are being sought after by a large percentage of expert feeders.

Dr. Hess Stock Food is the produce of science; it is the result of Dr. Hess' twenty years' experience in the study and practice of medicine, both human and veterinary.

It contains the bitter tonics long known in medicine for improving the appetite and increasing the flow of juices necessary to assimilate.

Direct from Mills to You

We Pay the Freight!

Beacon-ite is a ready roofing made of the finest long wool fibre thoroughly saturated with a special preparation that makes it absolutely water-tight. Wind, rain, snow or sleet has no effect on it whatever. It will not rust like tin or rot like shingles. It can be applied by anyone to any kind of roof; we furnish all necessary nails and cement. All you need is a hammer.

Beacon-ite roofing will save you money in two ways:

First. By buying direct from the mills you save the jobbers and dealers profits.

Second. By putting it on yourself you save the expense of hiring a roofer.

We want to quote you our Beacon-ite prices. You will find them to be about one-half the cost of tin or shingles, and considerably less than any other ready roofs. We want to send you FREE samples of Beacon-ite so that you can compare its quality with others. If you want better, cheaper roofing send for our FREE samples.

BEACON-ITE MILLS, 106 N. Second St., St. Louis

Gossip About Stock.

The KANSAS FARMER has inquiries for Russian wolf hounds. Any one who has such hounds will probably find buyers by using the "For Sale" column of the KANSAS FARMER.

Mr. T. P. Whittenburg, of Pleasant Hill, Mo., contributes a splendid herd bill to the Kansas City sale about which he writes as follows: "The Anxiety herd Hereford bull I have in the Combination sale at Kansas City on April 4, is certainly worthy of attention. He is a little over three years old and bred in the true blue Anxiety type and blood all through. He is just in good, strong, farm flesh, is a sure and good breeder, and is strictly straight, and all right in every way. I am selling him only because I must make a change as I have three lots of his calves on hand which are certainly good ones. Send for catalogue and examine his pedigree."

Mr. D. O. Bancroft, owner of Walnut Grove herd of Duroc-Jerseys at Downs, Kansas, has been reading about the large pigs mentioned by our subscribers in the KANSAS FARMER in several recent issues. He thinks he has a litter of nine Duroc-Jerseys that were sired by Reece's "Pride" 34715 and out of Dewey Reece 85416 that are as large and as good as anybody's 6-months-old pigs. These pigs were just six months old on March 18. The litter consists of 4 boars, 4 sows and one barrow. Their total weight is 1644 pounds, or an average of 182½ pounds. They have been grown on shelled corn and alfalfa hay and some milk and slop but have not been full-fed. Mr. Bancroft thinks they would easily average 225 pounds if they were fat. They are just in common stock condition. Let us hear from the next man.

A Document on Dip. One of the neatest documents of information for farmers that we have had the pleasure of examining lately, is the budget of facsimile letters of what users think of Dipolene Dip. Each letter is printed on a separate sheet of canary, onion-skin, bond-paper, the lot is then bound in a neat cover and tied with a dainty bit of baby ribbon.

After reading this bundle of letters we are convinced that every farmer should use Dipolene. Certainly the testimony of every witness in this case is conclusive evidence that it is a very effective remedy. And it is the unanimous verdict of the jury of American farmers that it will save thousands of dollars every year for the farmers who will use it.

We do not know whether or not the Marshall Oil Co. of Marshalltown, Ia., is prepared to send this document on dip to every farmer who wants it, but we do know that it would be a mighty good thing if every farmer could read these letters and we suggest that you write and ask them to send you one of these budgets. They will gladly send you a free sample of the dip; enough for you to give it a thorough test before you need buy any of it.

Sand-Papering Your Face.

You can get the hair off from your face with sand-paper. Probably you will lose the skin and a lot of bad language at the same time. For the purpose of shaving, common toilet and laundry soap is not much better than sand-paper. The hair comes off after a fashion, but your face is left red, sore and irritated. For easy and luxurious shaving you need a special soap. Williams' Shaving Soap is made for the face. Send to the J. B. Williams Co., Glastonbury, Conn., for a free trial sample as per their offer in another column. You will see that there is as much difference between real shaving soap and ordinary shaving soap, as there is between a Kentucky thoroughbred and a truck horse.

Passengers east from Chicago to Fort Wayne, Findlay, Fostoria, Cleveland, Erie, Buffalo, New York City, Boston and all points east, will consult their interests and find advantage in selecting the Nickel Plate road east from Chicago. Three through trains are run daily, with through day-coaches to New York City, and modern Pullman sleeping-cars to destination. Rates always the lowest, and no excess fares are charged on any train, for any part of the journey. Modern dining-car service, with individual club meals, ranging in price from 35 cents to One Dollar; also meals a la carte. Ask for tickets via the Nickel Plate Road. Chicago depot, La Salle and Van Buren streets, the only station in Chicago on the Elevated Loop. Chicago City Ticket Office, 111 Adams street. Detailed information may be secured by addressing John V. Calahan, General Agent, No. 113 Adams St., Room 298, Chicago.

Spokane, Wash., March 20.—L. McLean of Spokane, president of the Spokane Canal Company, will this year begin the irrigation of what he says is the largest peach orchard in the world. It will contain 2000 acres of land in the Wenatchee country, famous for its luscious peaches and big red apples. This will be the largest orchard of any kind in the State of Washington. This year 200 acres will be set out, and each succeeding year the acreage will be increased until the full tract is in orchard. The first trees planted will be in bearing at the end of the third year. A number of reservoirs will be constructed to supply water. All the land will be given to peaches except a few side-hill locations where grapes will be planted. It is believed that peaches can be furnished the market from the early part of June until the latter part of October.

David R. McGinnis, of Spokane, and his brother, J. W. McGinnis, of Waterville, are planning to put out an orchard of 450 acres near Orondo on the Columbia river 15 miles north of Wenatchee. This will be an orchard of winter apples and English walnuts. David R. McGinnis said to-day, "Land in this part of the State, when properly irrigated and cultivated, will pay interest on \$5000 an acre. Few dividends are larger than the profits of fruit raising in Washington."

Farmers have begun to learn that it pays to produce large crops. After enough corn has been produced on an acre of ground to pay the interest on the investment and the cost of the tending that acre, then each additional bushel means just that much profit.

If you are raising but forty bushels to the acre and it requires all of the forty bushels to pay the cost of raising it then there is no profit, but if you raise sixty bushels then you have twenty bushels clear to sell for profit. It costs no more to raise the sixty bushels than it does to raise the forty. The right kind of seed will produce that twenty bushels for the profit, and such seed is the Improved Yellow Leaming, Pride of the North and Reid's Yellow Dent raised, gathered and sorted by W. W. Vansant & Sons, of Farragut, Iowa. Their advertisement appears in another part of this paper. It will pay any farmer to write them.

Caustic Balsam Removed Cancer.

Toronto, Kans., June 21, 1904.
The Lawrence-Williams Co., Cleveland,
Ohio:

I have used Gombault's Caustic Balsam more or less for about twelve years and have had much success. The last bottle saved me about \$14 in my stock, and I fully believe that it cured a small cancer on my wife's hand. My belief is based on personal experience, as my father had had a cancer on his hand a year before, and this one was in every particular like it except not quite so large. The Balsam did the work and it has now been near eight months ago and no traces of it since. For proof of this statement you can write our druggist. Tom Finley, Toronto, Kans.
HARKER LOVETT.

Was Cured by Sloan's Liniment.

Dr. Earl S. Sloan,

Dear Sir:—I have been using and recommending your liniment in this section for some time. One of the most remarkable cures that I have known it to accomplish was in the case of Col. J. B. Brown, of Gainesville, Fla. He had entirely lost the use of his arm from Rheumatism. He began to use Sloan's Liniment and in ten days he was cured. I advise anyone who needs a good liniment to use Sloan's. Signed, J. M. Brown.

Branding Steers.

Did you ever brand a steer? Did the steer look happy and satisfied with life? Perhaps you feel about the same way when you shave. If so, stop using common soaps for shaving and try the only real shaving soap made especially for shaving by the J. B. Williams Co., of Glastonbury, Conn. If you once try it, you will never be satisfied with any other kind. That is why they are willing to send you a free trial sample as per their offer in another column. "Try it for your face's sake."

Spokane, Wash., March 20.—Of all wonders of the Pacific Northwest nothing interests the immigrants who are coming west at this time more than the beautiful apples which are raised in this state. The Northern Pacific news-agent at North Yakima, is supplied constantly with apples which he sells to tourists and home seekers. They are so large and fine in appearance that they are eagerly purchased. Hundreds of these apples are being returned by these immigrants, who ship them back to their friends to show the wonderful size and quality of the fruit. Sometimes they get to bidding against each other for large apples and run the price up to 20 cents and 30 cents apiece in order to get them as souvenirs. The agent makes no attempt to sell them except at train time.

The American Steel and Wire Co., has issued a neat little pamphlet which they name "Fence" and which is filled with interesting facts for users of wire fencing. It does not matter what kind of fence you use or buy, the facts given in "Fence" will be valuable. It is well worth sending for. It is free. Address The American Steel and Wire Co., The Rookery, Chicago, Ill., and a copy of this pamphlet will be sent you by return mail.

Gee Whiz washing machines are attracting the attention of enterprising housewives of Kansas who have much work to do and do it well with as little labor as possible. They are made by the Gee Whiz Manufacturing Company, Des Moines, Ia., and are very properly advertised in the KANSAS FARMER.

Every schoolboy knows that the fable of the fox and the sour grapes is inaccurate from a natural history point of view, says a London newspaper, and, as usual, every schoolboy is wrong. An eminent Oxford professor, on hearing the point discussed the other day, actually bought some grapes and then went to the Zoo, where he tried them on a fox, which ate them greedily!

Never set a friendly pace that you can not keep up.

SNAKES

are not found in the SNAKE RIVER VALLEY, but here is found the most beautiful tract of agricultural land in the United States, and you do your raining, and have no failures of crops, that's irrigation. No Cyclones or Blizzards. This country needs live, wide-awake men, who wish a new home in the rapidly developing west, and offers cheap land, good church and school facilities, and a chance to make money to those who are willing to work. St. Anthony, the County seat of Fremont County, Idaho, is a bright and growing town in the very heart of a rich and growing richer country, and if you wish reliable information in regard to prices, soil, climate and our prospects; write any of the following firms: First National Bank; C. C. Moore Real Estate Co.; Wm. D. Yager Livery Co.; Murphy & Bartlett, Cafe; Commercial National Bank; C. H. Moon, Farmer; Chas. H. Heritage, Riverside Hotel; Miller Bros., Grain Elevator; Skrait & Shell, General Merchandise; Chas. S. Watson, Druggist; Gray & Ross, Townsites; W. W. Youmans, Harness Store.

Getting What You Want

We all want a pleasant and prosperous home. This we have ready for you. We are subdividing and selling the splendid Los Molinos Ranch of 40,000 acres in the famous Sacramento Valley of California.

We have every combination to insure you success. Soil is smooth and richest sedimentary deposit. Climate so mild every month can be used for planting and growing crops and fruits.

Water shortage unknown, a dry season unknown.

All who see our lands are enthused. Come and look over our crop, garden and fruit lands. You will locate with us if you do.

Send for our booklet. Write for particulars. It will pay you. Address

LOS MOLINOS LAND CO., LOS MOLINOS, TEHAMA CO., CALIFORNIA.

AT KENNEWICK ON THE COLUMBIA.

The ideal climate, winters warm and balmy.

Under the Great Northern Pacific Canal.

The choicest irrigated land in the West.

Own a ten acre fruit ranch and be independent.

Why work for others; be brave and do as thousands have done before you. These men have not made a mistake in coming here, many are independent.

We produce the earliest fruit, berries and grapes grown in the West.

It is all that we claim for it. Write to

KENNEWICK LAND CO.,

KENNEWICK, WASHINGTON.

NAMPA, IDAHO

A railroad center of Southern Idaho, surrounded by 300,000 acres of magnificent farming and fruit lands. Only one-fourth of these lands are under cultivation. The UNITED STATES GOVERNMENT has appropriated \$11,000,000 to develop the water supply and work will begin in February this year. A beet sugar company has secured contracts on 6,000 acres of land and are now erecting a \$1,125,000 factory within the city limits and will handle the crop of 1906. We have just built an alfalfa meal plant to grind up the surplus hay and ship it away in sacks. A brewery company has just secured a site and will put up a \$90,000 plant. This will help the hop industry. A flour mill company is seeking a site and one will soon be located. You can not fail to see that all of these enterprises locating at the same time in a town of about 3,000 people will double and thruple its population in the next two or three years. We raise 5 to 8 tons of alfalfa per acre, 300 to 500 bushels of potatoes, two crops of timothy and clover, 30 to 60 bushels of wheat, 60 to 100 bushels of oats, 50 to 70 bushels of barley. All fruits raised to perfection. Write the NAMPA CHAMBER OF COMMERCE.

FOURTH ANNUAL SALE OF REGISTERED HEREFORDS,

BY THE

MARSHALL COUNTY HEREFORD ASSOCIATION

WILL BE HELD AT Blue Rapids, Kansas

THURSDAY, APRIL 5th, 1906.

32 HEAD OF BULLS

The Veterinarian

We cordially invite our readers to consult us when they desire information in regard to sick or lame animals, and thus assist us in making this Department one of the most interesting features of the Kansas Farmer. Kindly give the age, color, and sex of the animals, stating symptoms accurately, and how long standing, and what treatment, if any, has been resorted to. All replies through this column are free. In order to receive a prompt reply all letters for this Department should give the inquirer's postoffice, should be signed with full name and should be addressed to the Veterinary Department of the Kansas Farmer, Topeka, Kans., or to Dr. C. L. Barnes, Veterinary Department, Kansas State Agricultural College, Manhattan, Kans.

If in addition to having the letter answered in the Kansas Farmer, an immediate answer is desired by mail, kindly enclose a 2-cent stamp. Write across top of letter: "To be answered in Kansas Farmer."

Lame Mare.—My 13-year-old grey driving mare became lame when driven about a month ago; she went one-half mile and became so lame she could go no further. I turned her loose and she lay down and acted as though she might take lockjaw. She was bad for an hour then seemed to be all right. I did not use her again for a week. I got on her to ride to a neighbor's and she again became lame; she holds her foot up; the trouble seems to be in the hip. I examined the foot and could find nothing. I have used turpentine and different liniments on the limb.

Edna, Kans.

Answer.—This kind of lameness is very characteristic in animals which have the blood vessels closed. It prevents the normal amount of blood from supplying the affected limb, so that when the animal moves, there not being sufficient blood brought to the limb, it becomes numb, or in other words goes to sleep. In time, if the circulation is not restored to its normal condition, blood vessels in that region will supply the limb with some blood but not enough to give the animal its former usefulness. Mares in this condition may be kept for breeding purposes, but can not be useful as general-purpose animals.

Lame Mule.—I have a 6-year-old mule lately shipped 200 miles; he now goes lame in one hind leg; when standing he rests the foot on the toe. Horsemen say the cord is strained. The flesh is shrinking on the point of the hip. What is the trouble, and how shall I treat it? There is some swelling on the inside of the stifle joint. The mule is in good flesh.

J. B. W.

Sylvia, Kans.

Answer.—There has evidently been some bruising or straining of some of the muscles of the mule's limb. I would suggest that you apply a stimulating liniment to the affected area, rubbing it in thoroughly daily until the part is blistered.

Palisade Worm.—My colt is thin in flesh; it does not have a very good appetite; I have been feeding oats, corn, prairie hay and Kafir-corn; the colt's bowels move freely, and there is a very small red worm in the manure; also a bad odor. What shall I do for the colt?

Elk City, Kans.

Answer.—Your colt is evidently affected with the *Strongylus armatus* worm which is causing the trouble. We will send a press bulletin describing this condition fully, which will give you a better idea of the disease than I can in these columns.

Ailing Steer.—After being on full feed for three months, one of my steers commenced to cough, and was troubled in swallowing; then the left side of the neck and throat became swollen just back of the lower jaw; the swelling is hard but does not resemble lumpjaw; a veterinarian pronounced it quinsy, but his treatment does not help him; I have treated the steer about two weeks and he has been ailing for four weeks.

A SUBSCRIBER.

Ottawa, Kans.

Answer.—Apply the following liniment to the steer's throat: 6 ounces of turpentine, 2 ounces tincture of cantharides, 8 ounces of raw linseed oil; mix and apply this to throat daily.

Kansas City Live Stock Market.

Stock Yards, Kansas City, Mo.

Monday, March 19, 1906.

Although the first of last week developed lower prices of beef steers, the situation improved after Tuesday, and about all of the loss was regained by the close of the week, account of smaller receipts. Cows and heifers sold strong all along, and gained 10@20c for the week. Stockers and feeders continued dull, except for the most desirable kinds; these found a ready sale, and the accumulation at the end of the week was smaller than the end of the week before. Of course, the big snow storm of yesterday will hurt the market for country grades this week, and parties who can handle them would make a hit by buying now.

The run to-day is heavy at 10,000

KANSAS FARMER.

Established in 1863.

Published every Thursday by the
KANSAS FARMER CO.,
Topeka, Kansas

SUBSCRIPTION PRICE: \$1.00 A YEAR

Entered at the Topoka, Kansas, postoffice as second-class matter.

ADVERTISING RATES.

Display advertising, 20 cents per line, agate (fourteen lines to the inch). Continuous orders, run off the paper, \$1.82 per inch per week.
Special reading notices, 36 cents per line.
Special rates for breeders of pure-bred stock.
Special Want Column advertisements, 10 cents per line or seven words per week. Cash with the order.
Electrotype must have metal base.
Objectionable advertisements or orders from unreliable advertisers, when such is known to be the case, will not be accepted at any price.

To insure prompt publication of an advertisement, send cash with the order; however, monthly or quarterly payments may be arranged by parties who are well known to the publishers, or when acceptable references are given.

All new advertising orders intended for the current week should reach this office not later than Monday.

Change of copy for regular advertisement should reach this office not later than Saturday previous to publication.

Every advertiser will receive a copy of the paper free, during the publication of the advertisement.

Address all communications to

KANSAS FARMER CO.,
116 West Sixth Ave., Topeka, Kans.

Special Want Column

"Wanted," "For Sale," "For Exchange," and small want or special advertisements for short time will be inserted in this column without display for 10 cents per line of seven words or less per week. Initials or a number counted as one word. No order accepted for less than \$1.00.

CATTLE.

HOLSTEIN—Bull calves 6 and 10 months old—good ones. H. B. Cowles, Topeka, Kans.

REGISTERED Aberdeen-Angus cattle for sale. Fifteen bulls from 10 to 20 months old; 15 heifers from 1 to 2 years old; 15 heifers from 2 to 3 years old; 25 cows some with calves at side. I am making farmers prices on all or a part of the above cattle as I do not have room for them this summer. Heater Eclipse 38761 in service. A. L. Wynkoop Benders, Kans.

FOR SALE Red Polled bulls or heifers write to Otto Young, Utica, Kans.

FOR SALE—Holstein-Friesian bull calves. Address Hughes & Jones, Route 2, Topeka, Kans.

MILK COWS FOR SALE—By V. B. Howey, Route 1, Topeka, Kansas.

FOR SALE—Registered Hereford bulls, 18 to 24 months old, by Prime Rupert 4th; also car high grade yearling bulls. Duff & Sons, Norton, Kansas.

RED SHORTHORN BULL for sale. A. C. Rait, R. R. 4, Junction City, Kans.

FIVE REGISTERED HEREFORD BULLS for sale, all good individuals. Eight months, 9 months, 1 year, 20 months, and 4 years are their respective ages. Cooper Monroe, Lyons, Kans., R. F. D. 5.

FOR SALE—One registered double-standard Polled Durham bull, 2 years old in March, 1906, or dark red. Will consider trade for females of the same class of stock. Address Jacob J. Yoder, Haven, Kans. R. R. 2.

FOR SALE—The great show and breeding bull, 198 Duke Wildwood 148143, that took 4th place at the Kansas City Royal in 1904; also 20 cows and heifers all choice individuals, some show stuff. George Manville, Fawcette, Mo.

GALLOWAY BULLS—4 head, 16 to 18 months old, suitable for service. All registered. Address C. A. Kline, R. F. D., Tecumseh, Kans.

head, considering the storm yesterday. Other markets also report liberal supplies, and prices are weak to 10c lower to-day. Trains are delayed considerably, and a certain share of the earlier arrivals sold steady. Cows and butcher stuff have shown the greatest strength lately, choice Hereford heifers at \$5.25 last week, and most of the good heifers at \$4.40@4.75. Top cows sold at \$4.60, and bulk of cows \$3.25@4.15, top steers last week \$5.75 on several days, top to-day \$5.50, a good percentage at \$5.25 and more, bulk at \$4.70 and upwards. Bulls range from \$3.15@4, veals weak at \$5@6.75, stock calves changed little in price, but movement was free last of the week, stockers and feeders \$2.75@4.50, which is 25@40c lower than two weeks ago.

Packers made open rebellion last week, and delivered an ultimatum that hogs must be secured cheaper or they could not handle them. The result of their big fight was temporary lower prices, but on Saturday \$6.35 was paid for top hogs, equal to the highest this season. Run to-day is 5,000 head, market 5@10c lower, top \$6.25, bulk \$6.05@6.20, light hogs up to \$6.10, pigs around \$5.25. Supply last week 42,000 head, about like previous week, and 3,000 more than same week last year.

Sheep and lambs sold strong first of

last week, but closed the week 10@20c lower, lambs showing most loss and wethers least. Supply to-day is 7,000 head, market 5@10c lower. Lambs are very good quality, and are down so near prices of aged sheep that any decline in the market will have to include everything. Lambs now sell at \$6@6.50, wethers and yearlings bring \$5.40@5.90, ewes \$4.50@5.25. J. A. RICKART.

Kansas City Grain Market.

Kansas City, March 19, 1906. Receipts of wheat in Kansas City today were 89 cars; Saturday's inspections were 13 cars. The market was dull. Demand for good milling wheat was fair and holders asked 1c advance. The sales were: No. 2 hard, 2 cars 32c, 1 car 79 1/4c, 3 cars 79c, 2 cars 78c; No. 3 hard, 1 car 78c, 1 car 77c, 1

CATTLE.

Winter Vegetables.
(Continued from page 323.)

moisten the roots, but do not wet the tops or they will rot. Cover the trench with boards, and then with two or three inches of soil, leaving small holes in the end for ventilation. If the weather becomes severely cold, it may be necessary to add more covering. The celery will soon bleach if put away in this manner. It can be bleached in the cellar, but is more apt to rot and wilt.

PARSNIPS.

Parsnips should be planted as early in the spring as land can be worked, in rows fifteen inches apart and thinned, after they come up, to two or three inches in the row. Keep them cultivated and free from weeds while they are small, and they will take care of themselves the rest of the season. In the fall or early winter after there has been some freezing, dig what you want to use during the winter. They can either be kept in a cold cellar or buried.

CARROTS.

Sow the first of April in rows fourteen inches apart, and cultivate the same as parsnips. They must be dug in the fall before hard freezing and may be kept in a cold cellar or buried.

SALSIFY.

Sow early in spring in rows fourteen inches apart and cultivate the same as parsnips. In the fall you should take up what you wish to use and pack in boxes with some soil and keep in a cool cellar.

Salsify and parsnips are both hardy and can be left in the ground all winter if desired.

Turnips for winter use, globe varieties preferred, should be sown the middle of August and allowed to grow until freezing weather begins. They can either be kept in a cold cellar or buried.

Catalpa Speciosa.

E. F. STEPHENS, CRETE, NEB.

It is a serious misfortune that the reputation of the catalpa has been sadly discredited by the use of the Catalpa bignonioides and its hybrids for the true Catalpa speciosa, the hardy Northern variety. The Catalpa speciosa is erect in its habit of growth. The trees attain a height of sixty feet and a diameter of three to four feet. The wood has remarkable durability.

A Catalpa speciosa telegraph pole fifty feet in height that had been in use forty years and still sound, was exhibited at the St. Louis Exposition. Fence-rails forty years in service, railroad ties subjected to heavy traffic for thirty years still retaining their original soundness, were also included in the exhibit.

A remarkable instance showing the durability of catalpa wood comes from Missouri. In 1811 an earthquake near New Madrid sunk considerable areas of catalpa groves. Water flowed in over these sunken timber lands, killing the trees. In 1888 trees of the Catalpa speciosa were yet standing undecayed after a space of seventy-seven years.

PURITY OF SEED NECESSARY.

The Catalpa speciosa seeds very sparingly. Because of the erect habit of the trees, seeds are not as readily gathered as from the low-branched, spreading Catalpa bignonioides. The latter and its hybrids yield seed very freely. Since these are so much more easily and cheaply gathered, a large share of the catalpa seed in the hands of seedsmen is gathered from the bignonioides or its hybrids instead of from the speciosa. Seed of the latter is not infrequently worth \$1 per pound while the seed of the bignonioides can be purchased for twenty cents per pound. Not all seedsmen are sufficiently careful to keep these varieties distinct. This has led to the planting of great quantities of trees which were not of the correct type. These have caused grievous disappointment and greatly harmed the reputation of the true speciosa.

In discriminating between the seed of the two varieties it is well to bear in mind that the speciosa blooms earlier than the bignonioides. The seed-pods of the speciosa are also larger and longer.

CATALPA VALUABLE TIMBER.

At the Dayton, Ohio, car works, the wood of the catalpa is used for inside finishing of passenger coaches. The timber possesses all the requirements of such work, being susceptible to a fine finish. Furniture factories also utilize catalpa wood in the making of chairs and desks. As timber the posts will endure two or three times as long as the oak.

Twenty years ago the writer planted groves near Crete, Neb., on the land of the late Thomas Doane, then superintendent of the Burlington system. Twenty-six years ago a farmer planted a catalpa grove of two and one-fourth acres in Southeastern Nebraska. This grove was planted in one corner of the farm covering a ravine not convenient for farm crops. Timber to the value of \$77 per acre has been sold therefrom and a careful estimate shows the value of the remaining timber to be \$200 per acre.

A gentleman in Butler County, Nebraska, had a fifteen-acre grove of catalpa planted nineteen years ago. While growing, it protected a corn-field from the aridity of the southerly winds materially increasing the yield of the field. This farmer is now selling the timber for fence-posts, realizing a value of \$150 per acre.

A Pawnee County, Nebraska, grove, planted fifteen years ago, is now being cut and marketed for fence-posts. The local price realized is eight cents for fence-posts three inches in diameter and twelve and a half cents for four-inch posts. On this basis there can be cut in this grove at this time timber to the value of nearly \$200 per acre.

The catalpa reproduces itself rapidly by suckers from the stump and thus produces the second growth more quickly than the first. This timber appreciates fertile soil and under favorable conditions grows two or three times faster than on poorer soil. To secure speedy and most profitable returns, it is wise to plant on land of good quality. It, however, thrives, though more slowly, on the poorest hilltops. This tree transplants more safely than almost any other tree because of its heavy, fleshy roots. It can be safely transplanted as street trees even after attaining large size. Forest plantations are usually planted with seedlings of the age of one year.

Uncle Sam at Garden City, Kans.

Plans and specifications for the machinery for the Garden City irrigation project in Western Kansas have been approved by a board of engineers, and bids will be opened at Chicago on May 28 for the contract. This irrigation project is not one of the large enterprises which the reclamation service is developing. It is, however, attracting considerable attention on account of the numerous novel features involved in its construction. The water must be recovered from the underflow waters of the Arkansas Valley, which lie in gravel deposits below the bed of the river and under the adjacent valley. It is, therefore, necessary to sink several hundred wells from which the water will be pumped and discharged into a collecting conduit. The wells are scattered along a line nearly five miles long. The power is generated at a single central plant situated on the railroad, and then is distributed by electricity to the wells.

It is the first National reclamation project to be authorized in which it is necessary to pump water, and is the only project in which the water must be recovered from wells and not from a flowing surface stream of water. On this account much interest is taken in the project by people in Western Kansas and Nebraska. They believe that the demonstration to be made will be of value to many other communities situated similarly to that at Garden City.

Applications for water under this project have been made by the owners of more than 12,000 acres of land to be fenced, and the community is very enthusiastic concerning the future success of irrigation in the Arkansas Valley. Very large crops of wheat can be grown on the lands under this project, if a small amount of water is available in the fall and spring. Garden City has long been famous as an alfalfa center. This location seems to be especially well adapted to the maturing of the seed-crop of alfalfa, which has always paid well there. A sugar factory is being constructed at Garden City, where those who desire to raise sugar-beets will find a market for their crop.

Never enter a sick room in a state of perspiration (to remain for any time), for when the body becomes cold it is in a state likely to absorb the infection; nor visit a sick person—if the complaint be of a contagious nature—with an empty stomach. In attending a sick person, do not stand between the sick person and any fire that may be in the room, as the heat of the fire will draw the infectious vapor in that direction.

Williams' Shaving Soap

The lather from cheap, common soap is thin, harsh and quickly drying. If used for shaving it burns and irritates the face. The lather from Williams' Shaving Soap is rich, thick, creamy and emollient.

It makes easy work for the razor and it keeps the face comfortable and healthy. Which do you choose?

**Send 2c. stamp for trial sample
(enough for 50 shaves).**

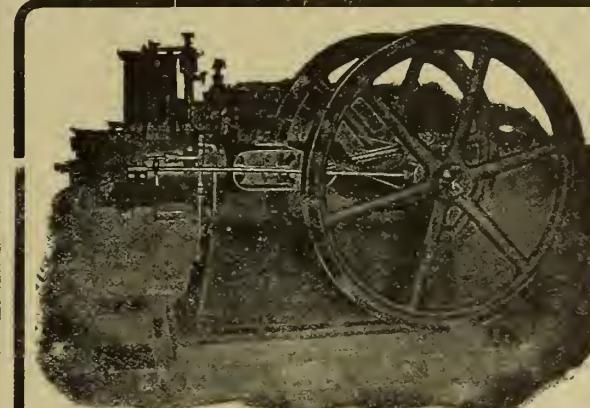

Williams' Barbers' Bar, Yankee, Mug, Quick & Easy Shaving Soaps and Williams' Shaving Sticks.—Sold everywhere. Address,

THE J. B. WILLIAMS COMPANY,

FRANK IAMS

and his "Big 4" three year old Percheron stallions, weight 8340 pounds. Winners of 1st, 2d, 3d and 4th prizes at Iowa and Nebraska 1905 State fair (over all). They are "sensation-*ni show stallions*"— "Iams' sort." Iams sells models like these "Peaches and Cream" stallions at \$1000 and \$1500. It's up to you, Farmer John! Will you be "humble gaged" by "bunco salesmen?" Iams owns and sells more 1st-class stallions than any man in the United States. He has his "cash or hankable note gets away from Iams. Iams' daily "Horse show" and his "town of horse barns" filled to the roof with wide-as-a-wagon "black boys."

120—STALLIONS—120

2 to 6 years old, weight 1700 to 2600 pounds, 90 per cent blacks, 50 per cent tan stallions." All registered, approved and stamped by European Government. Dad, it's "100 to 1" that Iams is pushing his competitors off the roof and hypnotizing his buyers with "top notchers" at 50 cents on the dollar, "let live prices." Iams' "horse show" at Iowa and Nebraska State Fair was the "talk of the town." The "heat ever." All winners and sons of winners. His 2, 3 and 4 year old Percherons, Belgians and coach stallions won every 1st, 2d, sweepstakes and grand sweepstakes prize at Nebraska State Fair. At Iowa State Fair they were winners of 90 per cent of same prizes in above classes, and the Iowa and Nebraska people said Iams is a "hot advertiser," but "he has the goods" better than he advertises. Teddy, it's "18 to 1" that Iams' "Peaches and Cream" stallions are "hot stuff" (for competitors). "It's a cinch" that Iams saves his customers thousands of dollars in commissions and middlemen's profits. Iams places \$1000 insurance for \$60.

\$1000—SAVED AT IAMS'—\$1000

Ikey! What a rich graft these "slick stallion salesmen" are working on the honest farmer selling 4th rate stallion at \$2000 to \$5000. Iams sells "top notchers," so good, big and cheap that they do not need to be peddled to be sold. Mr. Buyer, see Iams' stallions yourself. Take no "gold brick stallion salesman's" word. Iams has "the goods" you read about. His establishment is worth going 2000 miles to see. Iams makes his competitors "holler." He is knocking "high prices" out of the X'mas tree. Iams saws wood, "butts in," sells more stallions each year. He makes every statement good. Georgie, dear! Buy a stallion of Iams. His \$1200 stallions are much better than our neighbors paid those Ohio men \$4000 for. Then I can wear the diamonds. Iams speaks the languages, buys direct from breeders, pays no buyers, salesmen or interpreters, has no two to ten men to divide profits with. Iams guarantees to sell a better stallion at \$1000 to \$1500 than are sold to Stock Companies for \$2500 to \$5000 by slick salesmen, or pay you \$100 for your trouble, you the judge. Iams pays horses' freight and buyer's fare; gives 60 per cent breeding guarantee. Write for eye-opener and greatest horse catalogue on earth. References: St. Paul State Bank, Citizen's National Bank, St. Paul, Nebraska.

The Lincoln Importing Horse Com'y

Lincoln, Nebraska

Now we are here with our catalog. It is ready for distribution. Parties contemplating buying stallions write for catalog. Remember, every stallion represented in the catalog is of our own importation and all of them this year's importation, except the group of three. We also have a large number of stallions not exhibited in our catalog. Note what we say in regard to this group. The three weigh 5,890 pounds; the largest stallions in the West in the same flesh. Some of our 2-year-olds of our last importation will tip the scales at 1,850 to 1,900 in only moderate flesh. Come and examine them at our expense if you find that we have misrepresented to you. Remember, our scales are in front of our office. You do your own weighing.

SHORTHORN EVENT EXTRAORDINARY At Fredonia, Kansas, April 13, 1906

...ALL GOOD ONES...

The Southeastern Kansas Improved Stock Breeders' Association have decided to make their annual Spring sale at Fredonia, Kansas, the most important event not only of their circuit but of Kansas for this year. We know that we **must** offer good cattle to have a **good** sale, and we are offering our best cattle—all good ones.

We know it will not do to try to make a few good ones sell a lot of culs, so we are offering absolutely all good ones. Tabulated pedigrees will show animals by the following great Scotch and Cruickshank bulls: Imported Collynie, imported Mariner, imported Choice Goods, imported Lord Cowslip, imported Tillycairn, Battle Axe, and Golden Victor, Jr., of Harris breeding; Scottish Emperor, of Bellows breeding; Kinellar, Captain Archer, and Aberdeen, of Hanna breeding. :: :: ::

—The Winterless Land of The West—

Where water
is cheaper
than rain.
The 350 foot
weir on King's
river where
our water
supply
comes from.

Over \$250,000
invested in
permanent
improvements.
Here is the
right kind of
irrigation Sys-
tem, good im-
provements,
low rates,
62 1/2 cents per
acre per year.

Concrete Weir, Fresno Canal and Irrigation Company, Kings River. Headwater of ditch system for Fresno Irrigated Farms Company. Weir three hundred feet wide, four feet high.

A Reasonable Estimate

To give the stranger a fair estimate of what it would cost him to buy a piece of unimproved land and to improve the same by planting vines, orchards and alfalfa, we present here a reasonable estimate at which the work can be contracted for to duplicate this estimated ranch and also complete the necessary buildings thereon:

40 acres good first quality land, with water right, at \$75 per acre, \$3,000; payment 50 per cent cash, balance 6 per cent net for 5 yrs., \$1500
10 acres vineyard; planting to grapes, labor \$15 per acre, cost of cuttings 50¢ to acre \$2 per M. 160
10 acres orchard; planting trees, etc.; labor \$15 per acre; 80 trees to acre at \$15 per 100, \$12; \$27
20 acres alfalfa, checking land for irrigation, seeding and planting, \$20 400
Truck garden, vegetable garden, berry patch and chicken yards can be put among the young trees or vines.

Building five-room modern cottage, parlor, dining-room, kitchen, two bedrooms and bath; hard finished and plastered; two coats paint; boiler, bath tub and sink; good plumbing. 1100
Building barn, with wagon and horse sheds on sides. 200
Boring well 60 feet deep, cased with 4-inch galvanized casing. 24
10-foot steel indmill, \$38 to \$40; 32-foot tower, \$27; 2000-gallon tank; \$30; say. 100
Chicken house material and fencing about house and barn. 146

Say \$4000.

These prices are figured with a margin at which the work could easily be contracted. If owner would put his own time into the work he could save considerable. We now have an investment of \$4000 cash and owe a mortgage of \$1500.

Cash. \$4000
6 per cent interest on \$1500 mortgage, \$90; 6 per cent interest on \$4000 cash of yours, \$240. 330
Water tax on 40 acres of land at 62 1/2¢ per acre. 25
County taxes, about. 30

The vineyard and orchard are now growing, but are non-productive. The 20 acres of alfalfa, however, has produced three cuttings of from four to five tons of alfalfa per acre for the year, worth \$7 per ton; 100 tons it \$7, \$700.

Should the settler go into the dairy business (by all means the most profitable) the 20 acres will support 20 cows; each cow will produce in butter-fat per year, \$60; 1 calf, fattened on skimmed milk, worth \$8; 2 hogs, fattened on alfalfa and skimmed milk, will weigh about 200 pounds each, sell for 5¢ per lb., \$20.

The profit from each cow will be \$88, or for the herd of 20 cows. \$1760

As you have had to feed all the hay we will deduct. 700

Profit. \$1060

Recapitulation:

End of first year—Original investment. \$4385

First payment of one-fifth mortgage paid off now. 300

Less income this year. \$4685

Expense for second year:

Care, plowing, etc., 20 acres vineyard and orchard, \$15 per acre. 300

6 per cent interest of \$1200 mortgage, \$72; 6 per cent interest on \$3,625, your investment, \$218. 290

Water and county taxes, same as last year. 55

\$4270

Your 20 acres will now produce five cuttings this year, average of 7 tons per acre, at \$7 per ton, \$980; or would support 30 cows at a profit of \$88 per cow.	\$2640
Less cost of feed.	980
This year's income.	1660
Second payment, one-fifth of mortgage.	300

\$2910

Expense of third year:	
Care of property, same as year before.	300
6 per cent interest on \$900 mortgage.	54
6 per cent interest of \$2910, your investment.	175
Water and county taxes, same.	55
Third payment, one-fifth mortgage.	300

\$3794

Less income third year, about the same.	1660
Your investment at end of third year is now.	\$2134

\$2134

Expense of fourth year:	
Care of property, same as year before.	300
6 per cent interest on \$600 mortgage.	36
6 per cent interest on \$2134, your investment.	128
Water and county taxes, same.	55
Fourth payment, one-fifth mortgage.	300

\$2953

Alfalfa returns, same as before.	1660
	\$1293

\$1293

This year the vineyard and orchard should produce a crop of an average of \$20 per acre, but this is a good deal of a matter of speculation and we will not figure it in the returns.

Expense fifth year:	
Care of property.	300
6 per cent interest on \$300 mortgage.	18
6 per cent interest on \$1293, your investment.	77
Water and county taxes, higher say now, on account of improvements.	75
Fifth and last payment on mortgage.	300

\$2063

Returns:	
Income, alfalfa and dairy.	\$1660
20 acres orchard and vineyard five years old, easily produce net \$50 per acre.	1000

\$2660

Less investment.	2063
Profit.	\$597

\$597

In these figures no mention has been made of the cash return that can be derived from poultry and garden truck or berries. Of course the prudent man will include these.

Your \$1500 mortgage paid off, your \$4000 original cash investment paid back, a profit in coin of \$597, and a fine home, orchard, vineyard, and dairy—40 acres—easily worth \$9000, as a result of five years' work.

Is it worth the effort? You can now plow up a portion of your alfalfa and plant more trees and vines, should you wish, and the five-year-old trees and vines will support you. But don't plow up all the alfalfa; that's the mainstay at all times.

Volume XLIV. Number 13

TOPEKA, KANSAS, MARCH 29, 1906

Established 1863. \$1 a Year

EXTRACT MAN AND WATCH DOG.

EDITOR KANSAS FARMER:—I had a large St. Bernard watch dog. He had never bitten anyone and was not called a cross dog. He never liked tramps or peddlers. He would never hurt them if they stopped when he went to them. I kept him for protection for the feminine portion of the family as they were alone quite often and we live just a half mile from the railroad track and tramps are always plentiful. One day an extract man came. The dog ran up to him, when he was just a few steps from the porch, but the man came on. The dog knew that there were no men at home and was not going to let him come in. He grabbed him by the arm and left the print of his teeth. He never lost any work on account of the attack. One day he came and made me three propositions. (1) Pay him \$50. (2) Arbitrate. (3) Kill the dog. If I would not do any one of these he would sue me. He claimed I should have had up a sign "Cross Dog" when the dog was known to be cross. Had he any right to make me do any one of these as long as the dog was in my yard? P. B. BALBY.

Sedgwick County.

Under the conditions stated by this correspondent the "extract man" has no legal right to make any demand on the owner of the dog or on anybody else on account of what the dog is reported to have done. The case is not legally different from several others that may be mentioned to make the situation clear. If the extract man had found our correspondent's bull at large in the yard, and, laying aside discretion, had disregarded the hoarse bellowing of the bull as he lowered his head and came at the extract man, took him upon his horns, and tossed him over the fence, would the extract man expect pay for his torn pants or broken arm as the case might have been? Again, if our correspondent's mule had been browsing between the gate and the house near the walk, and, on the approach of the extract man, had turned his business members toward the walk, and had exercised them just as the extract man passed, breaking the extract man's leg and disfiguring his countenance, would anybody suppose that the extract man had a legal right to have \$50 damages, an arbitration, or to demand that the valuable mule be killed?

Besides his general legal right as a dog to do anything in Kansas except to worry sheep, this dog was doing a service for which his owner had a legal right to keep him. Besides having a legal right to go everywhere else, he had a peculiar and especial right to be on guard at his owner's premises. The dog was there by legal right; the extract man by courtesy only. If our correspondent should feel disposed to fill his yard with cross dogs so that none might enter, he might be chargeable with courtesy towards the rest of mankind, but no law would prevent.

The right to guard ones domicile is well illustrated by a case that is just now occupying a good deal of public attention. John D. Rockefeller, the head of the oil trust, is wanted as a witness in some matters that are under investigation in court. He remains in his home, has it guarded, and admits no one who could be suspected of being a server of subpoenas. Up to this time he has thwarted all efforts

of the officers to see him. "His house is his castle," etc., and "the king, unbidden, may not enter."

Such is the legal aspect of the case. The extract man is not likely to sue. But, treat him kindly, buy a year's supply of extracts from him, and, if they are good extracts, speak of their excellence to the neighbors, but so long as the dog is needed keep him on guard.

A NEW GRASS.

The new Teneriffe Canary grass seems to be attracting a great deal of attention throughout the country, and believing that our subscribers would be interested in testing this new candidate for public favor, we have made arrangements with the introducers to

York City, telling what you want to build and asking for a copy of the above named book.

For our correspondent's purpose, a concrete made of 1 part Portland cement, $2\frac{1}{2}$ parts clean sand and 5 parts broken stone will be found satisfactory. Or a very good wall may be made by using 1 part Portland cement and $3\frac{1}{2}$ or 4 parts clean sand.

On a tight platform, or in a mixing-box, scatter the cement over the sand; shovel the materials to one end and then to the other until thoroughly mixed as will be shown by the uniform color of the mixture. If broken stone be used, wet the stone thoroughly, throw it on top of the cement and sand mixture and turn it at least three times with the shovel. At the second

can be brought to full height at one operation.

A usual mistake with beginners is to underestimate the pressure of the concrete upon the forms, with the result that these often give way. This is especially liable to happen when the materials are tamped.

THE HUSBAND'S INHERITANCE.

EDITOR KANSAS FARMER:—Question 1. Please tell us through the next issue of your paper, when the law took effect in Kansas, making a husband heir to one-half of his wife's property at her death, if he survives her.

Question II. If a widow, who has property, marries again and still keeps that property in her name and has no children by this second husband, can this man come in as an heir to this property? If so, to what extent?

A KANSAS FARMER READER.
Greenwood County.

Section 5 of Chapter 63, Acts of 1859, provides that after payment of debts, one-half in value of all the real estate, of the husband, shall at his death be inherited by his wife, if she survives him.

Section 29 of said chapter says: "All the provisions hereinbefore made, in relation to the widow of a deceased husband, shall be applicable to the husband of a deceased wife. Each is entitled to the same rights or portion in the estate of the other, and like interests shall in the same manner descend to their respective heirs.

These provisions of Sections 5 and 29 of the Act of 1859 were embodied in Sections 8 and 28 of the Act of October 31, 1868. The Act of 1868 is still in force.

The second question is substantially answered in a decision of the Kansas Supreme Court, 52 K. 392.

"An intestate, who was three times married, by his first wife had one child, by his second wife one child, by his third wife, surviving him, he had five children. At his death one-half in value of his real estate, not necessary for the payment of his debts, descended in fee simple to his widow, and the other half to his seven children equally. Upon the death of the widow, his estate descended to his own children."

In case there are no children and no will, the survivor, whether husband or wife, inherits all the property not necessary for the payment of debts. In any case the survivor in Kansas inherits half.

RECIPROCITY—RAILROAD QUESTIONS.

In a letter to the Editor dated at his "Hill Crest Alfalfa and Feeding Farm," Bon. Thor. M. Potter says:

"I have read with much interest your reprints on the tariff reform along the lines of the American Reciprocal Tariff League. I wish you would impress upon your readers the importance of the Republican party recognizing the great agricultural interest of the West by placing a plank in its platform favoring reciprocity, and another plank recommending abolition of the pass, and providing for passenger service at two cents a mile; also providing for a commission whose decisions should be final and immediately effective until reversed by the courts if upon review the rate fixed were found to be confiscatory."

THE KANSAS FARMER has no desire

GENERAL EVANS 13166

Head stallion Jones Stock Farm included in sale at Fair Grounds Topeka, April 3, 1906.

send a small sample of the seed free to any of our readers who desire it. A postal card request addressed to the Iowa Seed Co., Des Moines, Iowa, is sufficient, providing you mention this paper, and they will also send directions for culture and a copy of their large illustrated seed catalogue. It is claimed that Teneriffe Canary grass has produced over \$60.00 worth of seed per acre besides an excellent hay crop, and we believe that it will pay all farmers to give it a trial.

CONCRETE WALL FOR CELLAR.

EDITOR KANSAS FARMER:—I want to build a cellar, 9x12x7, with walls 8 inches thick. Please inform me how to mix concrete and apply for best results. I would like to build 3 feet and raise my box. Will it stand or shall I make a box the full height? Please answer through the KANSAS FARMER.

Miami County. J. M. EDWARDS.

Every person who intends to build concrete work of any kind should secure a copy of "Concrete Construction about the Home and on the Farm." Write a postal card to the Atlas Portland Cement Co., 80 Broad street, New

turning add water enough to give the mixture a mushy consistency. This mixture is to be shoveled immediately into the forms for the wall, and well tamped. If the broken stone be omitted, the cement and sand can be made into a soft mortar by using the right amount of water. It will then scarcely need to be tamped, but should be pushed down next to the forms with a puddle.

The "form" or box should in all cases be in readiness before the materials are mixed. The form is preferably made of green lumber. It is well to give the boards a coat of crude oil on the side that will come in contact with the concrete. This prevents the materials from sticking to the boards. If, however, it is proposed to plaster the wall, the oil must be omitted. In this case, wet the boards.

The form may be made 3 feet or $3\frac{1}{2}$ feet high, filled to that height, left over night, raised the next day and the work continued. It is also quite possible to build the wall on only one side or two sides at a time. In this way less material will be required for the "form." Or, the one side or two sides

to enter partisan politics. It is willing, however, to say that Mr. Potter's suggestions are a reminder of the little-used doctrine that the farmer is entitled to consideration in arranging tariff schedules. Doubtless it is now time for a farmers' inning in tariff legislation. The great reciprocity convention, which resulted in the formation of the American Reciprocal Tariff League, made it plain that the protective-tariff policy is conceded to be permanently established. Even ex-Senator Harris of Kansas accepted this doctrine on the floor of the convention. But to be fair, this protective tariff should protect markets for the farmer as well as for the manufacturer. To secure such protection for the farmer is the object of the league. Every voter should see that his interests in a "square deal" are duly impressed upon the political organization to which he belongs.

This is a time of breaking away from bosses and all dictation in matters political. The voter need no longer fear for the consequences of acting according to the dictates of his conscience regardless of what the so-called "business interests" of the East, or anywhere else, may say.

But it is not so much political fear as it is political apathy that causes the farmer to neglect his interests in a political way. Whenever the time shall come that four-fifths of the farmer voters shall attend the primaries, and shall take active parts in their proceedings, evincing a proper understanding of measures as affecting their interests, it will be found that politicians, whether in office or wanting to get in, will be very careful for farmers' views.

The extent and influence of the pass evil is little realized. The time is coming when a person holding public office will be as much disgraced if found holding and using a railroad pass, as if found accepting a bribe of any other kind. The question of extending favors of the Inter-State Commerce Commission is now the "unfinished business" in the U. S. Senate. The bill passed the House by a very large majority. It has the powerful endorsement of President Roosevelt. It is conceded by all that no other president ever has had so much influence as he. Doubtless some extension of the powers of the commission will be made. The matter has passed beyond the realm of newspaper discussion. Those who wish now to promote any view of the matter should write to Senator C. I. Long, Washington, D. C. expressing their views and presenting their arguments.

Reports indicate that the convention to be held at St. Louis on April 16 and 17 under the auspices of the Southwest Promotion club is to be a great gathering. Those wanting detailed information should write to Hon. Nathan Frank, chairman of the executive committee.

BLOCKS OF TWO.

The regular subscription price of THE KANSAS FARMER is one dollar a year. That it is worth the money is attested by the fact that thousands have for many years been paying the price and found it profitable. But the publishers have determined to make it possible to secure the paper at half price. While the subscription price will remain at one dollar a year, every old subscriber is authorized to send his own renewal for one year and one new subscription for one year with one dollar to pay for both. In like manner two new subscribers will be entered, both for one year, for one dollar. Address: The Kansas Farmer Company, Topeka, Kans.

Miscellany

Observations.

EDITOR KANSAS FARMER:—Here are a few observations on articles from the issues of March 8 and 15 of THE KANSAS FARMER.

In the issue of March 8 in the article "Among Some Flowers of Easy Culture," by Jeanette Brown, I should have included zinnias in the collection. They are very hardy and tough, very free flowering, and make a fine blaze of different colors. The flowers grow both single and double in size and bloom from early summer until the severe frosts in the fall.

Pocket gophers are easily trapped, and without any bait. Open the runway at the newest made mound and put in

a trap. Cover over the trap, but leave a small hole open for light beyond the trap. The gopher comes to investigate, walks over or into the trap, and is caught.

Farmers on rural routes would find the parcels post of great convenience in many ways. Hurry it along.

In my opinion, based on my father's knowledge with my own little experience, Chas. H. Jackson is correct in his statements in regard to the warbles and ox bot fly. I have watched the big blue-black fellow many times. I have seen the cattle run with their tails held out and up in a peculiar fashion, it being claimed that the tail was held up for a bait for the fly to strike at instead of their backs. The fly strikes the back and lays the eggs under the hide. During the winter and spring a person can feel them and very often squeeze out the most forward ones. These flies will create a miniature stampede among cattle by buzzing near them.

ED. A. LORD.
Kingman County.

Select Seed-Corn Now.

F. B. Mumford of the Missouri Agricultural College calls attention to the fact that farmers might with greater profit select seed-corn before spring work begins. Numerous investigations, he says, have shown that in the average year, a Missouri corn-field has 75 per cent of a stand. That is to say, the Missouri farmer will plant and cultivate 106 acres of corn and harvest 75. The cause of this is poor seed. He offers this simple method of testing seed-corn: Put several old newspapers in the bottom of a box and wet them. Then spread a white cloth with checkerboard squares on top of the paper, each square being numbered. Now number the ears to correspond with the squares. Take three grains from each ear and place them on the cloth in the square bearing the same number as the ear. Put another cloth on top of the grains and place the box in a warm place. In four or five days they will have sprouted. Now start with ear 1. If all three of the grains from that ear have sprouted vigorously, it will do for seed, but if the grains fail to germinate or show weak and spindly sprouts, throw the ear aside, and so on for every ear. In this way, almost a perfect stand can be secured which means a much larger yield per acre.

A Long-Distance Concert.

Imaginative writers have pictured wonderful possibilities of the telephone. Serious people have deemed it a waste of time to read of the things forecasted to result from the use of the lines connecting the little instruments now found in so many farmhouses. That some of the wildest dreams are being realized is evidenced in the following from a correspondent of the American Telephone Journal of Feb. 10.

"Some time ago the author participated in a musical performance given by two players separated by many miles, with the audience located at yet a third distant point. The author, provided with a hand-receiver connected to the telephone circuit and standing before a large horn attached to the transmitter, played on a French horn for the benefit of listeners in the office of the Spokesman-Review, at Spokane, Wash., 726 miles from Salt Lake City, in which place he was located.

"The remarkable feature of the performance was that the piano accompaniment was played by a music dealer named Reeves at his store in Helena, Mont., 525 miles away. A transmitter, equipped with a megaphone, was mounted on top of the piano and this player also wore a head-receiver.

"In playing the Miserere, from Ill Trovatore, for instance, your correspondent waiting in Salt Lake City, could hear Mr. Reeves play the introduction, and then being well acquainted with the score, knew just when to begin the melody. Then at the close of the strain, he would listen until the intermezzo had been played on the piano up at Helena, and then begin again. There was not the slightest jar between horn and piano during the entire program, and people listening along the line thought both instruments were being played in the same room. Your correspondent screened the adjutant's office at Fort D. A. Russell and the offices of the Cheyenne newspaper 500 miles distant, and one night was gotten out of bed at 11 o'clock to serenade numerous central offices of the company scattered through the southern part of Utah. General Manager Murry was much interested in these experiments, and afforded every facility for their conduct. When satisfactory con-

nnections are made with the Pacific Coast, an effort will be made to serenade the newspaper offices of several coast cities from Salt Lake. It is believed that the experiment could be carried on with success with Omaha, and even points east of that city.

"An attempt was made by the telephone engineers to locate transmitters in front of the great organ in the Salt Lake Tabernacle, and reproduce organ recitals at points along the system, but the Mormon Church authorities were not favorable to this, and the experiments were cut short before they had been perfected."

Educating Young Farmers.

EDITOR KANSAS FARMER:—Within the last ten years nothing has been so marked in the educational world as the many efforts being made for the education of the farmers of the West. The attendance at the Agricultural Colleges has greatly increased, the legislative appropriations have been more and more liberal, and the strictly agricultural, stock, and horticultural courses have easily taken the highest and most popular rank in these colleges.

The farmers' institute work has taken on new importance and popularity. In Kansas this year more than one hundred farmers' institutes have been held since last September with an aggregate attendance of nearly twenty thousand farmers. Not only did the Agricultural College assist in these institutes, but it sent a corps of its workers in a special train, through the courtesy and liberality and far-sightedness of the Rock Island railroad officials, over the entire lines of that road in Kansas, reaching at least ten thousand farmers in that way.

THE SHORT COURSES.

Until a few years ago no special effort was made to reach young people who could not enter college for a full year and for the regular course. Now this institution is offering twelve-weeks' courses in farming, dairying, animal husbandry and in domestic science. Possibly a brief outline of work just ending will interest the farmers of Kansas, especially the young people. These courses are open to persons eighteen years of age and over. No maximum limit is made and men have been taking this course who are fifty years old—experienced farmers, men who come for this work and bring grown sons and daughters with them. The work is made intensely practical, not technical, largely made up of lectures and laboratory work. About one hundred and fifty men have been taking these courses, a fine body of earnest, sensible people who have done an enormous amount of work in a short time.

THE FARMERS' COURSE.

Naturally the largest group of students is found in this course which includes crop production, feeds and feeding, breeds of live stock, stock judging, and carpentry the first year, and farm management, diseases of farm animals, grain judging and farm blacksmithing the second year.

Crop production includes a discussion of the different soils, different crops, soil moisture, tillage, cultivation of crops, soil fertility, corn and wheat judging, methods of planting and seeding, etc. Farm management has included lectures on division of fields, rotation of crops, methods of restoring fertility, handling farm machinery, plows, cultivators, mowers, and all farm tools, laying out of farms, plans for farm buildings, farm accounts, drainage, etc.

Animal husbandry has had two courses, one on breeds of stock which has consisted of about fifty lectures on the various breeds of cattle, horses, hogs and sheep, with actual daily drill in the barns in judging the stock that day under discussion. These boys had the opportunity of attending a great Percheron horse sale held at the college barns. Another course of great interest taken by about 100 men was that of stock feeding. This consisted of a series of lectures on feeding beef cattle, hogs, sheep, and dairy cows, with opportunity to keep in touch with the experiments now being conducted here.

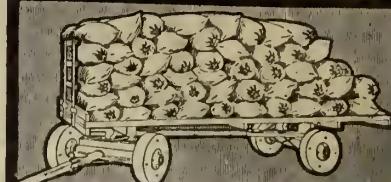

THE DAIRY COURSES.

These have attracted a great many young farmers who are already successful dairymen as well as many who simply want to make dairying a more important factor of farm business. The regular dairy course has had fifty-five students and their work has been exceedingly practical, handling separators, testing milk and cream, making butter and cheese and ice cream, with lectures on dairying, feed for dairy cows, diseases of dairy cows, etc. The college has a well-equipped

A BIG HAUL

It easier on the team and on the man with a Farmers Handy Wagon than a half load with the ordinary high-wheel wagon. It rolls over the softest ground without cutting in. Loads in half the time with half the labor. You'll never know what a real handy wagon is until you've used the handiest wagon on earth.

THE FARMERS HANDY WAGON

The Farmers Handy Wagon is the invention of a farmer, and it meets all the conditions he aimed to fulfill. It saves time, saves labor, saves money every day on the farm. Sold by dealers. Write for catalog that describes and illustrates the many uses a Handy Wagon can be put to—it's an interesting book and it's free.

The Farmers Handy Wagon Co.

Saginaw, Mich.

Branches: Kansas City and Des Moines. Makers of the Handy Hay and Stock Rack and Handy All Steel Frame Silos. Catalogue free.

MADE IN SAGINAW

creamery plant with the best of machinery for the making of butter and cheese, with 35 dairy cows, and this department now has fifty-two farmer customers who bring in separated cream. This gives the students the practical experience so very desirable, fitting them for handling a regular dairy, for making farm dairying more profitable, or for handling a creamery and making butter, or for taking charge of a cheese factory.

It is interesting to talk with these young men, to see them in recitation and to feel that this short course will be an inspiration for better farming, for better living, for a higher standard of citizenship. This winter the writer has met a great many farmer "short course" students and they are always alert and ready and it is very evident that their neighbors are watching them, realizing that they have learned something even in the "short course." A very remarkable thing, too, is that these one hundred and fifty young men came to the college in one day, dropped into the ways of the school at once, and have been treated just as well by everybody as if they had been university seniors. Verily the farmer's work is taking on a new dignity in these recent years.

Agriculture

Summer-Fallow vs. Plant to Corn.

I have a nice level field consisting of 135 acres. This field has been in cultivation for twenty years, with the exception of about 15 acres of new ground two years old. This ground has had corn on it for the past two years and last year made about 15 bushels to the acre, with the exception of the new ground which made 38 bushels per acre. I thought I would plow this land in April or May and disk and harrow for wheat. The ground has a very heavy crop of stalks and crab-grass and I thought plowing this under would greatly benefit the soil. Which do you think would be advisable, to summer-fallow or plant to corn?

FRED HUMPHREY,

Barber County.

I would recommend summer-fallowing the old land in preference to cropping it with corn as a preparation for sowing this land to wheat in the fall. A fifteen-bushel crop of corn will hardly pay for the growing, and on soil which is deficient in fertility, as this appears to be, especially in your part of the State where the rainfall may not be over abundant, you can doubtless put the land into better condition for growing a good crop of wheat next season by summer-fallowing than by cropping during the present season.

In order to develop the fertility of the soil and conserve the soil-moisture, you should practice summer culture in summer-fallowing this land, that is, cultivate the field occasionally after plowing, in order to destroy weeds and keep the surface mulch of mellow soil. This land is doubtless somewhat exhausted of humus and is becoming deficient in fertility, and in order to give the land the most benefit I would recommend not to plow early this spring, but to disk the land and sow some early grain crop, as barley or oats, and plow this under for green manure some time in June before the grain has made too rank a growth. Cultivate occasionally during the balance of the summer as described above. This will not only conserve the soil-moisture and develop the fertility of the soil, but will hasten the decay of the green matter and produce a firm, well-settled seed-bed for fall seedling of wheat. Plowing under the stalks and crab-grass will add some humus to the soil, and in case you do not crop this season, it will be much preferable to plow under this material rather than to remove it or burn it on the ground. But doubtless you can prepare a seed-bed for barley or oats by disk and harrowing as I have described, and later plow under not only the stalks and crab-grass, but the green crop which has been produced; but do not let the growth get so rank and mature that it will not readily decay when plowed under. The object should be to get the soil well settled and firmed before sowing to wheat.

A. M. TENEYCK.

Australian Salt-Bush.

Can you tell me anything about Australian salt-bush, a plant supposed to be something like alfalfa, and suited for dry climates? Also advise where the seed may be had, price per bushel, and amount of seed necessary to sow per acre.

SAM. M. DEAN.

Morton County.

The Australian salt-bush (*Atriplex semibaccata*), is not botanically related to alfalfa. It is, however, a forage plant which grows very successfully in alkali soils, producing abundantly where it is adapted for growing, making a fodder of high feeding value, and comparing favorably with alfalfa and clover in this respect.

We have not experimented with the crop to any extent at this station. It appears to be grown most successfully in California and some of the Rocky Mountain States. There are a number of varieties of salt-bush, which seem to vary in composition, production, and in their adaptation for growing under different climatic and soil conditions. You may secure seed of Australian salt-bush from the large seedsmen. The price is \$1.50 per pound, as published in their catalogues. One pound of seed is sufficient to plant an acre. The seed should be mixed with ten to twenty times its weight of ashes or ground grain so as to facilitate its distribution. It may be sown with the grain-drill, or better with the grass-seeder attachment to the grain-drill. The seed-bed should be carefully prepared and the seed should not be covered more than a half inch or so. Probably we should not sow too early in Kansas, but wait until the ground is warm taking care to prepare the seed-bed early, cultivating it at intervals in order to conserve the soil-moisture, and put the soil into good condition for germinating the seed. At this station we have usually failed to get the seed to germinate.

You may secure Farmers' Bulletin No. 108, on this subject, by writing to the United States Department of Agriculture, Washington, D. C. The California Experiment Station has also published a bulletin, No. 125 on Australian salt-bushes. A copy of this bulletin may be secured by writing to E. W. Hilgard, Director of the Experiment Station, Berkley, California.

A. M. TENEYCK.

Farm Management.

Will you kindly advise me through the KANSAS FARMER how to manage my 80 acre farm? I have a good, average upland farm 6½ miles from Ottawa. I have hardly made my expenses since I have owned the place. I have 5 acres in alfalfa, sowed last fall. I am going to sow 10 acres to oats, plant 36 acres to corn, and have 20 acres of prairie-hay meadow.

ANDREW BRADY.

Franklin County.

On a small farm, such as you describe, it is almost necessary to engage in some specialty in farming in order to make more than a bare living. As to what this specialty should be depends largely upon the farmer, as well as upon the soil and the location. In your section of the State and situated near so large a town as Ottawa, you could engage in the breeding of some kind of pure-bred live stock, such as hogs, sheep, or cattle, or you could make a specialty in some line or lines of crop-breeding; for instance, raise pure-bred seed-corn. There is a great demand today for better-bred seed-corn and better-bred seed of all kinds of crops.

If you want to learn how to succeed in special lines of farming, I advise you to come to Manhattan and take our short course in Agriculture which begins January 1 each winter, lasting twelve weeks. If you can not do this, determine on some special line of farming which you would like and secure all the information you can in the way of bulletins, books, and literature,

it grows successfully, than may be secured from Indian corn.

Certain varieties of millet, as the hog or broom-corn type or variety, succeed well in Western Kansas. I should also recommend for trial in your part of the country cow-peas, a most excellent forage crop, and where the crop grows successfully, yields of two or three tons of good hay may be secured per acre. The hay is similar to alfalfa hay in feeding value. Cow-peas not only make a valuable crop for forage, but are excellent to use in rotation with other crops, acting as a soil-fertilizer, since the plant is a legume. By means of the bacteria which grow on the roots of the plants, the nitrogen-content in the crop is largely taken from the air and the supply of nitrogen in the soil may be actually increased by the growing of a crop of cow-peas.

A. M. TENEYCK.

and make a study of the business before engaging in it. Meanwhile you can grow larger crops of corn, grain and alfalfa by thorough tillage of the soil, proper cultivation of the crop, and by the application of fertilizers especially barnyard manure, which you can doubtless secure from Ottawa during the winter season for the hauling. Six miles and a half is a long distance to haul manure, and yet, if you had nothing else to do, it might be well to haul manure during a part of the winter season when the roads are good. Eight or ten tons of good manure spread over an acre of your upland soil, if it is like the average upland soil of the State, would give an increase of 10 to 15 bushels per acre in the yield of corn for the first, second and third season after the manuring.

I have mailed a copy of my notes on crop rotation, which may give you some suggestions. Also, I am preparing a bulletin on "Farm Management" which will probably be published some time during the summer or early fall. You may secure the bulletins of this Experiment Station free by sending your name and address to Professor J. T. Willard, Director.

A. M. TENEYCK.

Directions for Testing the Vitality of Seed-Corn.

A. T. WIANCKO, AGRICULTURIST, PURDUE UNIVERSITY AGRICULTURAL EXPERIMENT STATION.

No farmer can afford to neglect making sure that every ear of corn he uses for seed will produce strong vigorous plants. The difference between none and two or three weak ears per bushel of seed-corn, may amount to hundreds of bushels in the resulting crop. The cost of producing an acre of corn is practically the same whether the stand of plants is good or poor, so why not have the good stand and the larger crop?

To make the germination test, proceed as follows:

1. Make a shallow tray or box about two feet by three feet in size and two inches deep inside. Bore small holes, one and three-quarter inches apart, in the sides and ends about half an inch from the top. Through these holes string light copper or galvanized wire both ways, thus marking the tray off into squares—a square for the kernels of each ear of corn to be tested. A stout string may be used instead of the wire but it will last only one season. Instead of weaving in the cross-wires, a piece of large-meshed, wire chicken fencing may be nailed on top of the tray, with a half-inch strip all around the edges on top of the wire so that when the tray is covered the cover will not rest on the wire. This is the "tester."

2. Fill the tester up to the wires with earth or sand and thoroughly wet it.

3. Take the tester to where your seed-corn is stored, or take both tester and the selected seed-corn to a place where you can work conveniently.

4. Take the first ear of corn and remove five kernels, each from a different part of the ear, and put them on the first square in the upper left-hand corner of the tester and press them down into the earth. Lay the ear on a shelf or table. Then take the next ear and proceed in the same way, putting the kernels in the square to the right of the first and the ear in the corresponding position beside the first ear on the shelf. Continue this until the first row of squares is filled, then turn and come back on the next row below. The ears corresponding to the second row of squares may be laid in a row on top of the first row on the shelf. Whatever the system followed, the ears must be so arranged that the ear belonging to the kernels in a certain square in the tester may be easily located.

5. After the kernels are all placed and well pressed into the wet soil, carry the tester into a room where the temperature can be kept around 70 degrees. The ordinary living-room will be about right, but the tester should not be put near the stove.

6. Cover the tester with panes of glass, resting lightly on the sides so as to let in a little air. Glass makes the best cover because it prevents drying out and at the same time permits one to see how the corn is getting along without lifting the cover.

7. After four or five days take off the cover, carry the tester to where the corn is stored and then examine the kernels in each square. If any lot of kernels shows dead germs or weak sprouts, throw away the ear from which they came. [Send to the stock editor.] Never use an ear which does not show at least four strong roots and stem sprouts out of five kernels tested.

The tester may be made of any size

THE SIGN OF THE FISH

has stood for the BEST during seventy years of increasing sales.

Remember this when you want waterproof oiled coats, suits, hats, or horse goods for all kinds of wet work.

convenient. The one described above will test about three bushels of ear-corn at a time, or every five days.

Denaturized Alcohol for Farm Purposes.

The object of this article is not to augment the consumption of alcohol as a beverage, but to find channels other than a digestive one, for its employment. Alcohol in its abuses constitutes a danger of mankind, but it has been proved that it can rival gas, acetylene and electricity for lighting and domestic uses. That which causes disorder of the stomach of man, agrees perfectly well with the internal organism of stoves, lamps and motors. Ethyl alcohol, which forms the basis of all fermented liquors, is the oldest and best-known of the whole group of alcohols, and is generally designated by the simple name, alcohol. It may be produced in various ways. Science enables us to employ an inexhaustible series of products of the soil, and has created a new source of riches for the agriculturist.

MATERIALS FROM WHICH ALCOHOL IS MADE

The materials used in the production of alcohol are of two classes—those containing starch and those containing sugar. In the first class are included potatoes, corn, rice, barley, oats, rye, and wheat. In the second class are sugar-beets and molasses from sugar-beets and cane sugar. The potato has been used for the manufacture of alcohol since the eighteenth century, and in many parts of Europe it constitutes the most important raw material for its production. Experiments to produce vigorous potatoes from seed and secure a high percentage of starch, which is of the greatest importance for the manufacture of alcohol, have met with very good success. Diseased potatoes, except when attacked by dry rot, can be advantageously utilized for the manufacture of alcohol because the chemical changes produced by the disease extend more to the skin and less to the starch.

Corn is extensively used for distilling purposes in the United States, Hungary, and Italy. It contains 60 to 75 per cent of starch, and in addition about 11.5 per cent of sugar, and 4.8 per cent dextrin. By breeding and selection, the amount of starch in corn can be largely increased, thus making it an ideal cereal for the manufacture of alcohol for industrial purposes.

Barley, rye, oats, wheat, and rice contain from 42 to 78 per cent of starch, which, when the price will permit their use, are valuable materials for the manufacture of alcohol.

In the manufacture of alcohol from sugar-beets, the yield depends solely on the percentage of sugar. The selection of the best beets for distilling purposes is not of importance, and beets which can not be advantageously worked for sugar may be practicably utilized for alcohol.

Molasses, which remains as a residue in the manufacture of sugar, is utilized for the manufacture of alcohol. The percentage of sugar in molasses is about 50 per cent.

Of the raw materials containing sugar, which can be utilized in the manufacture of alcohol, are Jerusalem artichoke, the gigantic carrot, chicory, sorghum-stalks and corn-stalks.

HOW ALCOHOL IS DENATURIZED.

The denaturization of alcohol is accomplished by mixing with the alcohol a small proportion of repugnant ingredients, which, while not injuring its efficiency for technical uses, render it unfit for consumption as a beverage. The denaturizing substances employed depend upon the use to which the alcohol is to be subsequently applied. They include pyradin, picolin, benzine, wood vinegar, wood alcohol, gasoline, and acetone oil (derived from the grease of the wool of sheep), as well as other similar products.

ALCOHOL IN GERMANY.

For several reasons the subject of the technical use of alcohol has reached in Germany an advanced stage of development, which if followed by the United States will mean a great change in our agricultural and industrial development. Germany has no natural gas wells nor native petroleum supply. When some years ago the question of adopting motor carriages for military purposes was under discussion, it was remarked by the officials of the War Department that kerosene and gasoline engines could be operated only with one or the other of the products of petroleum, which is not found in Germany and the supply of which may in case of war be wholly cut off. But the broad, sandy plains of Northern and Central Germany produce in ordinary years cheap and abundant crops of potatoes, from which is easily manufactured by

processes so simple as to be within the reach of every farmer, a vast quantity of raw alcohol. Under these conditions "spiritus," as it is known in Germany, became one of the standard and important products of agriculture, and every effort has been made by the imperial and state governments to promote and extend its use for domestic and industrial purposes. A law was passed in Germany which maintains a very high tax on alcohol intended for drinking, but exempts from taxation such alcohols as are denaturized and used for industrial purposes. Since the passage of the above law, inventors and scientists have been busy in the improvement of processes and the manufacture of distilleries. Now perfected motors, lamps, and cooking and heating apparatus have been devised and put in use, until crude alcohol is becoming one of the most widely utilized products of German industry.

ALCOHOL FOR LIGHTS AND POWER.

For lighting purposes, as alcohol gives a non-luminous flame, a chemical mantle is used similar to the Welsbach burner, which produces a very bright, intense and economical light, costing but one cent per burner, per hour, for 71 candle power. For the production of heat generally it is simply perfection, and nothing has yet been found to equal ethyl alcohol for this purpose, owing to the fact that it produces perfect and complete combustion.

Alcohol made repugnant to the taste is being used as an incandescent light. Instead of being drunk, it is burned. It propels the farm motor, the automobile and launch, and the simple fact of obtaining denaturization permits each private citizen to light his farm or factory, to heat his home, do farmwork, or transport himself. One of the neatest of the many new devices used in Germany is an alcohol flatiron with a small reservoir, which being filled with alcohol and lit, heats the iron for the hour's work, at a cost of less than two cents. The cleanliness and economy of these figures to the housekeeper, are obvious. For farm motors alcohol is a perfect fuel because of its complete combustion, the absence of its noxious odors, its uniform quality and its unlimited and universal sources. While it is true that the heat of combustion of alcohol is practically only half that of gasoline, yet twice as large a percentage of heat can be converted into useful work as in gasoline, and hence point for point, alcohol is as efficient as gasoline.

ALCOHOL ENGINES.

Only slight modifications of gasoline engines adapt them to the use of alcohol—a fact which is of much importance, since an engine to be efficient and practical for general use must not be too highly specialized. Because of the great elasticity of the charge after ignition, the stroke on an alcohol engine to be most efficient ought to be about double the bore of the cylinder. A high compression and comparatively cool mixture should be attained, and a good spark, complete vaporization and a complete mixture of the charge secured. Alcohol of 90 per cent strength, with 10 per cent of water is usually employed. Wherever small engines can be used and a power safe in every respect is of value, the alcohol motor can be advantageously employed. Its spread during the few years of its existence in Europe, has attained quite unexpected proportions, and will doubtless continue. Since 1896 the law in Belgium has exempted from taxation alcohol for industrial uses. Since that time this has also been done in France, Austria, Hungary, Belgium, Italy and Russia.

ALCOHOL BEFORE THE GREAT WAR.

Special documents show that in the United States alcohol was used for lighting, cooking and industrial purposes in the early sixties. Before the war of secession, the manufacture of spirits was free from all special taxes and supervision, as much on the part of the Union as on the part of the States which composed it. It resulted from this freedom that alcohol served a multitude of industrial uses. The production was enormous, amounting to 90,000,000 gallons, coming especially from the distillation of corn. For lighting purposes enormous quantities were employed. In 1864 the city of Cincinnati alone utilized 12,000 bushels of corn per day for distillation. Because of its low price, alcohol was also used as fuel for the domestic kitchen, for bath and laundry. Denaturized alcohol has been produced in Germany chiefly from potatoes, and sold for 13 cents per gallon. It is stated in the March number of Power, 1901, that a New York distiller produced alcohol at a cost of 8 cents per gallon. It was sold in New York in carload lots at \$2.26. The tax is \$2.08 per gallon, which would leave 18 cents

to cover cost of production, profit, and risk of tax. Distillers claim that from 40 cent corn, alcohol can be manufactured for 13½ cents per gallon of 94 per cent strength. In Cuba, Peru, Brazil and other sugar-producing countries, alcohol is manufactured from the waste products, and hence very cheaply produced. The present price in Cuba is about 10 cents per gallon. It is thus seen that alcohol can successfully compete in price with gasoline, which now sells for from 12 to 22 cents per gallon. There is an urgent need in this country for free alcohol in the field of heat, power, and light.

GASOLINE ENGINES.

Within the past five years there has been a remarkable increase in the output of gasoline engines, and more particularly among the smaller sizes. When the fuel requirements of the engines of a rapidly growing automobile industry, in addition to an annual output of over 100,000 gasoline engines, is contemplated, it becomes a question of the most vital importance. The average percentage of gasoline in petroleum from all the oil-fields of the world is less than 2 per cent, and this fact taken in connection with the constantly increasing demands, accounts for the great increase in the price of gasoline within the past few years. The supply must eventually be exhausted. In view of these facts it seems apparent that through false economy the people may be deprived of a natural resource. The use of alcohol for fuel-purposes would benefit the farm by producing a market for a great many starchy materials unfit for, or unnecessary to consumption, and at the same time reduce the cost of motive power for farmwork.

The fact that all foreign countries have laws providing for free industrial alcohol and that alcohol is being successfully employed by these countries for such purposes to the great injury of our own trade, is striking evidence of the wisdom and practicability of removing the tax on alcohol in this country. A law for this purpose will bring prosperity to the greatest body of our best and truest citizens, the American farmers, who will derive from their farm products of corn, wheat, potatoes, and waste products, denaturized alcohol, by which they will be able to light and heat their homes, cook their food and drive their engines; which will furnish power for the farm implements, pump water for the cattle and for irrigation, as well as numerous kinds of other farm labor. Favorable action on a subject of such vast importance and one in which the need for action is becoming so acute, should not be long delayed by a government "committed to the protection of home industries." Every one who uses one or more of the thousand articles requiring alcohol in their manufacture; every one who is obliged to accept cheap and noxious substitutes which may be foisted upon him instead of alcohol, for legitimate purposes, and every one interested in the price of corn and other farm products of which alcohol may be manufactured, has a grievance against the present system of taxation now in force.—C. J. Zintheo, U. S. Department of Agriculture, in The Gas Engine, January, 1906.

Last Word on the Boys' Corn-Growing Contest.

EDITOR KANSAS FARMER:—The Boys' Corn-Growing Contest, started by the Kansas State Agricultural College, promises to go way beyond the expectation of the Institute Committee. It certainly has struck a popular chord and has appealed to farmers and business men as a worthy movement. It was the intention of the college committee to leave large latitude for the county committees in the matter of seed-corn and prizes. For the most part, corn is being selected from nearby farms, although many are sending to distant parts of Kansas, and some to Iowa and Illinois.

All local committees should now set a date when entries must close, and a date and place or places for distribution of seed-corn. By May 1, 1906, I want to receive from each local or county contest committee the following data: (1) Number of boys enrolled in the contest. (2) Variety or varieties of corn furnished to the boys, and cost of same, if purchased. (3) Amount of premiums offered and whether in cash or merchandise. (4) Entire premium list, including those for quantity as well as for best ten ears. (5) A printed list of names of contestants with post-office addresses. This may be cut from county or local papers publishing same.

The work should be pushed vigorously now in these next few weeks. It is hoped that every county in Eastern

Kansas will have not less than 200 contestants, and many counties will have 500 enrolled. This is a movement worthy of the time and thought and labor of the busiest men of any community.

Many counties have offered additional premiums for the greatest yield obtained from one quart of corn. Many of the committees have also made the contest open to girls.

The Institute Department will gladly co-operate in any further way for the success of the movement.

J. H. MILLER,
Farmers' Institute Secretary.

Alfalfa on Sod.

Editor Kansas Farmer: I would like to inquire through the columns of your valuable paper if there is any one raising Iowa Silver Mine corn west of the Fort Hays station, that has a few bushels of seed to spare? If so, would like to have him write me at Banner, Kans.

I wish to say in answer to E. L. Kellogg's inquiry in the issue of March 8, as to sowing alfalfa on sod, that I have had very good luck in seeding alfalfa on freshly-broken sod, if broken deep and well pulverized with a disc, especially so on sandy land. I consider the time when the sod is first broken up the best for sowing alfalfa on sandy soil. I prefer broadcasting to drilling, and I harrow the seed in by using a slanting tooth harrow. I consider 10 pounds No. 1 seed sufficient for a good stand.

F. P. MANZER.

Trego County.

Farm Notes.

Care and fertilizers make the farm; care and feed make the stock.

A little turpentine in their feed speedily relieves animals troubled with worms.

By using the drill for sowing, the depth of covering is uniform and there is no loss of seed.

The effect of overfeeding is very disastrous in most cases and especially so when the stock is quite young.

The productiveness or unproductiveness of the farm depends chiefly on the farmer and his methods.

About one-half of the time when stock is fed for a certain market, it is sold at a disadvantage.

The richness of the food given to stock has much to do with the value of the manure made from it.

No farmer makes a mistake when he determines to make his manure pile as large as possible so that every source of fertility shall be utilized.

The best way to make the hay crop profitable is to feed it on the farm and return the manure to the soil.

Thorough cultivation is essential to good crops, but thorough preparation of the ground before planting is just as essential.

Clay ground should never be plowed when wet, but very gravelly or sandy soil may sometimes be plowed wet without much damage.

In nearly all cases, the wisest course is to convert the grain into meat before shipping it to market and thus keep up the fertility of the farm.

Comfort is a prime condition of animal growth and this can be secured only by comfortable surroundings, such as warm, dry stables and sheds.

In using kerosene in killing lice on stock, mix it with lard about half and half, or it may take all of the hair off, if it does not otherwise injure the stock.

As the season comes in for active operations on the farm, do not, in the rush of work, forget the improvement of the stock. Keep better breeding animals the coming year than ever before. Buy blooded males of the best strains and grade the herds and flocks up to a high standard as soon as possible.

N. J. SHEPHERD.

Eldon, Mo.

The Price of the Surplus is the Price of the Whole Crop.

What to do with our surplus products is a problem of vital interest to the farmer. The manufacturer complains bitterly of what he calls his "surplus," but the manufacturer does not have to operate his plant at full capacity unless the trade will take his output. Nine-tenths of the manufacturers of the country work only on orders or contracts, and shut down or reduce their working force whenever they can not obtain orders. Very few manufacturers make up goods and then wait for customers to come.

The farmer, however, does not produce his crops "to order." When he sows his wheat he has no means of knowing whether the crop will bring 50 cents or \$1.50 per bushel. He must trust to the market for the price, and to nature for the crop. The same un-

Now IS THE TIME! GET A GOOD READY FOR HARVEST

You have heard of the cow that gives a big pail of milk and then at the last moment kicks over the bucket and spoils it all?

What about the man who grows a good crop of grain and then *half* harvests it?

You wouldn't waste *half* your crop.

Of course not.

But why waste *any* of it?

Why not get it *all*?

As the boys say, "Every little bit helps."

Every little bit *wasted*, counts—and counts *against* you and your profits.

As a sensible farmer, you can't afford to approach harvest time without making sure that you are ready for it the very minute that your grain is ready.

You cannot afford to depend upon a harvesting machine that wastes even a small part of your grain.

You cannot afford to spend your money for a "may-be-so" harvesting machine—one that may or may not do your work for you in a satisfactory manner.

You cannot afford to start harvesting with a machine that may break down at your busiest moment.

You cannot afford to start harvesting with a machine that will half kill your horses before your grain is cut.

You cannot afford to start harvesting with a machine that is likely to cause delay in your work.

You cannot afford to take chances.

You want to be sure, and now is the time to make sure.

Go to the Nearest Dealer

Examine for yourself the line of standard harvesting and haying machines for 1906. Get a catalogue and study their construction. You will find in

Champion, Deering, McCormick,
Milwaukee, Osborne, Plano

lines harvesting and haying machines that meet your every expectation and fill your every requirement.

They are *right* in principle and design, for they are the product of a half century's inventive genius. Every improvement that the best mechanical experts of the world have been able to discover or devise in 50 years is embodied in their construction. That's why they are *so* convenient to handle—why they do their work so well. That explains too why they are *so* easy on man and horse—and why they waste so little grain.

They are *right* in materials, for their manufacturers by co-operation are able to produce and select the best materials. By co-operation they are able to own, control and operate their own lumber camps, their own iron mines, their own coal mines, their own coke furnaces, their own steel mills and other sources of raw materials, thus being sure at all times to have materials for making their machines of the highest quality.

They are *right* in workmanship, because the demand for these standard machines is so great that immense factories are necessary for their production, and their manufacturers are able to equip the factories with the best facilities and the most expert workmen?

They are *right* in reputation, for they have by their own merit survived years of strenuous competition. They gained their popularity solely on their merits. They retain their popularity in the same way. They are used all over the world solely because they have met the demands and filled the requirements of grain-growers and grass-growers.

Is not that just the machine you need for your harvest for 1906?

You certainly want a machine with a reputation behind it—you cannot afford to run risks. Where can you find a machine of any kind that has a record of more years of successful, satisfactory work than you know these machines to have?

You want a harvesting or a haying machine made of the right materials. No machine can have *better* materials than have these machines—few manufacturers are fortunate enough to secure so good.

You want a machine that is built on the right plan—that "works right"—that is constructed on the right principle. The approval of the grain growers of the whole world—the successful standing of the test of years—the ever increasing popularity of these machines—these things tell the story of how they are built and how they work.

In reputation, in workmanship, in materials, in design—in all that goes to make good harvesting and haying machines they are *right*. They will meet your every requirement.

Can you afford then to go into the harvest with a machine that may fail you?

Can you afford to run the risk of a "break down" at a critical stage of your harvesting?

Can you afford to waste a part—even a small part—of your grain or grass?

Don't do it but go to the International dealer, secure a catalog, inspect these machines, and "get a good ready for harvest."

If you don't know an International dealer—write to us for the name and address of one near you.

Certainty prevails in live stock and every other product of the farm. When his products are ready he ships them to market and takes his chances. He can not, like the manufacturer, close his plant or reduce his force. He must go on, year after year, raising all that he can and trusting to the market.

In nine years out of ten American markets for farm products are made by the volume of the surplus which must be exported; and the Western farmer must trust to the demand of foreign countries for his price. In normal years about 30 per cent of our wheat and our commercial productions of meat must be shipped out of the

country. More than 60 per cent of our cotton and about half our tobacco goes abroad, and directly or indirectly, about a quarter of our corn crop is surplus.

Twenty-five years ago our surplus of live stock and provisions had grown to \$175,000,000. In the next two years, when the markets of Continental Europe were closed to our cattle and our pork, our exports declined about \$60,000,000, and the great pressure of the surplus on our markets caused a ruinous fall in the values of live stock in this country. American houses searched the world over for other markets, and our exports gradually recovered, and in 1890 the German market was reopened

to our pork. The exports of the live stock industry, by 1900, had grown to about \$260,000,000. In the past three years, however, Germany has gradually closed her ports by new inspection laws, and her influence has been exerted in other countries to shut us out, and our foreign trade in meats has been declining. The surplus is left in our markets and is helping to cause depression in prices.

Hence the importance of the reciprocity movement now in progress. Every farmer in the country should ask his Congressman and Senators to help open the Continental European markets to our grain and meats.

Feeding Questions.

I wish some advice along lines on which we have never had any experience. We expect to sell our land some time this year, perhaps before fall, although will probably not give possession until January or March. It is our intention to feed out about eighty head of average cattle, nearly all she stuff. They will range from three to seven years old and about fifty will soon have calves, say in the next eight weeks, the majority in March. The intention is to feed for the January or March market. Feed will be alfalfa, raised on 45 acres, all the cuttings, Kafir-corn cut with harvester and cared for in good shape, sorghum broadcast-

at this long range, I do not know whether I can be of much service in helping you to solve the problem.

I understand that it is your intention to dispose of all cattle on the place, not later than March, 1907. From the fact that all ages and undoubtedly various types of cattle will be included, it will be impossible to put this bunch of cattle on the market much above the butcher class of cattle. It probably would not be good policy to try to make too great use of expensive grain to finish them. You will undoubtedly be able to raise an abundance of good roughage. The 45 acres of alfalfa will yield you at least 200 tons of hay and, if this amount can be well cured, you will have a most valuable feed ready in sufficient quantity to put these cattle in fair condition. To supply the grain of the ration, I would suggest that you raise all the somewhat thickly planted fodder-corn possible. If the season is favorable and you succeed in getting considerable grain in this fodder, it will greatly aid in putting the cattle in good condition for market. If the pasture is good, the cattle will probably thrive and gain well during May and June. As soon as the pasture shows any signs of failing, the feeding of fodder-corn should be started and it would be well to have some early-planted corn for this purpose. From this on, the cattle should be fed a suffi-

three or four months before they are to be sold. You should, of course, run some hogs after these cattle to save the corn and this bunch of shoots, which you have on hand, will be in good shape for this purpose and you can carry them through the summer on pasture, alfalfa if possible, with very little grain. They will have size and frame and will not have cost very much and will be in good condition to utilize the undigested grain dropped by the cattle. You may find it necessary to feed a little corn extra to the hogs in order to get them ready for the market when the cattle go.

G. C. WHEELER.

To Poland-China Breeders.

EDITOR KANSAS FARMER:—At a meeting of representatives of the four breeds of hogs, viz; Berkshires, Poland-Chinas, O. I. C.'s and Duroc Jerseys, recently held at the Kansas City Stock Yards, it was unanimously decided to hold a breeders' show for the above-named breeds. The American Royal directors proposed to this committee to duplicate for prizes any amount, not exceeding \$150 each, raised by each breed. I ask all Poland-China breeders interested in this show to please give me their views in regard to this matter and let me know by April 1, what amount they will contribute for these

Kendall's Spavin Cure

What horseman does not know the standard cure? Infallible when taken in time for Ringbone, Curb, Splint, Spavin. Never two opinions as to its powers.

Bone Spavin Entirely Cured.

Kenton, Ohio, Feb. 20, 1905.

Dr. B. J. Kendall Co.,

Enosburg Falls, Vt.
Gentlemen:—I had a fine horse which I priced at \$200.00, which got Bone Spavin almost half the size of a hen's egg; I used two bottles of your Liniment and entirely removed the Spavin and now no one can tell one limb from another.

Yours truly,
Lawrence Althauser.

Price \$1; 6 for \$5.

Defeated the International Grand Champions of 1903 and 1904. Imported and owned by McLaughlin Bros., Kansas City Columbus and St. Paul.

ed with some Kafir mixed, about one-fifth Kafir. This mixing does not make the stock so lose and is eaten with a better relish too. Corn was planted thickly in June for fodder and bound. We want to use little, if any, corn. My idea was to feed late-planted corn when pasture begins to fail, but when stover gets dry then what?

I know a bunch of steers fattened on alfalfa, exclusively, that averaged 1000½ pounds each. No other feeds were given them. Unfortunately, no one knows how much feed was consumed but the owner was well satisfied with the results.

Would you advise breeding the cows with a view of their fattening better? This I should like to have you answer fully for people differ so on this subject. We have never had any experience so these questions which may seem very simple to you are perplexing to us.

We have used a Duroc boar on well-bred Poland-China sows. Nine sows now have 53 pigs, seven being first litters. These were September and October pigs. They are weaned now, of course, and not a runt among them. Every person who sees them comments freely on them. The result of crossing is very satisfactory indeed. Will breed no further of course. S. I. WILKIN.

Rooks County.

The proposition which you have before you is a somewhat difficult one and,

client quantity of the fodder-corn to keep them gaining. As soon as the corn begins to dry, you had better begin feeding alfalfa hay and continue through the winter giving them what alfalfa they will consume and in addition, fodder corn. Kafir-corn may be used but the grain will not give as good results when fed in this way, it being so small and hard that it is not properly masticated.

As to the disposal of the calves which will undoubtedly run with the cows through the summer, I would suggest that if the prices for veal remain good that might be the best method if disposing of them. If they are not sold as veal calves while they still retain the calf-fat, it will be necessary to carry them through the winter as stockers, feeding plenty of alfalfa and some grain. You could hardly hope to mature and finish them as baby beef by March, so that they would have to be sold as stockers if carried through until that time. They should not be allowed to suffer hardship through the winter and should be kept gaining at least a pound to a pound and a half daily. Experiments have shown that it does not pay to keep calves through the first winter upon a ration of hay alone, although if first-quality alfalfa hay be used, this statement might not hold good.

Cows in the fattening-pen will be quieter and feed better if they are bred

prizes, so we will know just what we can do.

There will be no entrance fee to this show.

Oak Grove, Mo.
Committeeman for Poland-Chinas.

Caring for Sows.

The American Swineherd gives the plans of two practical and successful breeders in caring for their sows at farrowing time, which they have adopted as the results of twenty-five years' experience:

"My method of saving pigs at farrowing time is to get the sows in good condition before they begin to farrow by giving them plenty of exercise by a good range in a pasture field, which brings their system into a condition for easy farrowing. It prevents them from becoming restless in getting up and down while farrowing, which is one of the reasons for sick pigs. About two days before she is due to farrow I put her in a lot by herself, make her a nice bed and am around her a great deal to get her tame and accustomed to me so she will not be afraid. Then scratch her and have her lie down, and she will become quiet and very docile at farrowing time. No matter how the sow acts, never strike or kick her at this time. She never forgets it. She appreciates good treatment at this time. Take her pigs as fast as they come and put them in a basket. In cold weather

set them behind a stove until she is through farrowing. Then with a pair of little pinchers take off the little tusks so that they will not bite their mother or each other. You will find upon examination that the little pigs have eight long teeth, four below and four above the mouth. Now, if you break these teeth off when they first arrive or are not over a day old, there will be no sore noses or mouths, as you oftentimes see them. Nor will your sow be jumping up every little while. It is these eight sharp teeth that cause the trouble and the loss of many a good pig. She jumps up when they bite her and drops down as quick and catches one or more of the pigs under her. Experience has taught me to prevent this by disposing of these little tusks. If they are not snipped off they not only endanger their lives by the sows lying on them, but become embroiled in bitter fights which leave them with sore mouths that become fatal if not looked after. Too much importance can not be given this little transaction of de-tusking the little pigs at birth.

"A breeder should stay with his sows himself in the time of farrowing if he desires to save the pigs. It is difficult to hire any one who will take as much interest as yourself. If you get the pigs one week old you are safe with them, or at least I am.

"This is my method of saving pigs and I generally can save as many as the sows can take care of.

"Our pigs will begin to come the forepart of February, and if any of the boys want to see me at that time they will have to come to my hog house, as I am on deck at that point."

The second plan is:

"The sow is let go at will until she is due and when she shows signs of maternity or making her bed, she is quietly placed in a pen by herself. The person who knows the day of service can tell almost exactly what time she will farrow. Farrowing 112 to 115 days from the date of being bred.

"The owner should make it a point to be with the sow at the time of farrowing and see that the pigs get started right. They usually farrow at night and a person should not be above his business and should be on hand looking after these things. This is when a person will be well paid regardless of time of night to watch carefully the farrowing sow. If she shows no indication of being restless, she should be let alone at least twenty-four hours. Then for the first few days after farrowing she is fed lightly but gradually carried up to full feed as the pigs grow older. Care must be taken and not carry the pigs along too fast. A fat, overdone pig when young is a ruined pig for future development."

Concentration of Business Interests Brings Buyers.

EDITOR KANSAS FARMER:—A Kansas man never loses interest in his own State no matter where he may be located. During the last few months that I have been away from Kansas, I have observed a number of the things that the progressive farmers and stock-breeders of Wisconsin are doing, and invariably and almost unconsciously, my mind compares the methods employed with those that exist in Kansas.

One of the things that is being agitated and pushed at the present time is the concentration of agricultural interests in a given community. For instance, the Holstein-Friesian interests are being pushed at Lake Mills where a number of breeders are producing this class of cattle. A buyer looking for Holstein cattle invariably goes to Lake Mills because he has a greater opportunity for selection, and, if he is a heavy buyer, can probably get what he wants in car-load lots. The benefit derived from the concentration of business interest is shown by the fact that \$200,000 worth of registered and grade Holstein cattle have been shipped from this one point during the past year. Not infrequently a buyer wants an animal of a certain age, and if the breeder does not have what is wanted the buyer is referred to his neighbor who is ready to supply the demand. By the breeders' working for each other in this way, they not only advance their own interests, but the interests of the entire community.

At other points in Wisconsin the Guernseys are being pushed in the same manner. The breeders are not only cooperating in the selling of cattle, but they cooperate in the use and exchange of bulls. Whenever they find an extra good bull they do not allow him to leave the community, but pass him around from one breeder to another as long as he is a serviceable animal.

Other things being equal, mature sires produce the best offspring.

This method of cooperation and concentration of breeding interests is being practiced, I believe, in Marshall County, Kansas, by the Hereford breeders. Would that there were many other communities that would cooperate by selecting some one breed of cattle, or one breed of hogs and then push that breed for both quality and numbers and thus attract numerous and influential buyers.

University of Wisconsin.

Western Feeds for Beef-Production.

Bulletin No. 132, just issued by the State Agricultural College Experiment Station, Manhattan, Kans., is a detailed account of an experiment in steer-feeding at the Fort Hays Branch Station. Sixty-four head in eight lots were used. The experiment included a comparison of the roughages, alfalfa hay, Kafir-corn hay, and sorghum hay, and a mixture of these; comparison of the grains, corn-and-cob-meal, Kafir-corn, wheat, and a mixture; and a comparison of different proportions of protein. In general the results showed the very great advantage of the use of alfalfa hay and of the balanced ration.

Following is a statement of the general conclusions reached:

For beef-production, ground Kafir-corn is about equal, pound for pound, to corn-and-cob-meal when alfalfa hay is fed with either of these concentrates. However, with sorghum hay as roughage, it required 57 pounds more of the ground Kafir-corn than of the corn-and-cob-meal to produce 100 pounds gain. As would naturally be expected when the Kafir-corn hay constitutes the roughage of the ration, 232 pounds more of the ground Kafir-corn than of the corn-and-cob-meal were required to produce 100 pounds gain. Cattle can be well finished for the beef market on a ration of ground Kafir-corn and alfalfa hay.

Ground wheat and alfalfa hay, fed together, is not an economical ration for beef, on account of the loosening effect of these feeds on the steers and the expensiveness of the wheat. With corn-and-cob-meal at 45 cents per bushel and wheat at 78 cents per bushel, the cost of 100 pounds gain, when both are fed with the alfalfa as roughage, is \$5.13 with corn-and-cob-meal and with the wheat is \$8.50, or a difference of \$3.37 in favor of the former.

A matter of this experiment of considerable interest, especially to the Western farmer, is the part that the various roughages play in beef-production. A ration of alfalfa hay, at \$4 per ton, with corn-and-cob-meal produced 100 pounds of gain for \$5.13; but when Kafir-corn hay at \$3 per ton was substituted for alfalfa hay, the cost of 100 pounds of gain was increased to \$7.32, while with sorghum hay at \$3 per ton substituted for the alfalfa hay the cost was increased to \$9.06. In other words, one bushel of corn-and-cob-meal fed with alfalfa hay as roughage produced 11.8 pounds of flesh, while the same amount of corn-and-cob-meal fed with sorghum hay as roughage gave in return only 6.25 pounds of flesh; thus, a difference of 5.5 pounds, or 88 per cent in favor of the alfalfa hay ration.

There is yet much to learn about the most profitable combination of Western feeds for Western conditions, though the evidence is certainly good that it pays the stockman in dollars and cents to study this feeding problem as far as it is worked out by science and wait for further results. It is the opinion of the writer that the Western feeds grown without irrigation have the chief food constituents in a slightly different proportion from those grown under more favorable conditions, though the nutritive ratio, of the rations fed, and the profit per steer have a direct relation to each other. For practical work the results would be little changed by this difference in composition.

The nutritive ratio of the corn and alfalfa ration was 1:6.79, or practically a balanced ration, and the average profit per steer was \$8.98; the nutritive ratio of the corn and Kafir-corn hay ration was 1:14.98, or an unbalanced ration, and the average profit per steer was 90½ cents; while the nutritive ratio of the corn and sorghum hay ration was 1:17.29, or much too low in protein and a decidedly unbalanced ration, the average loss per steer being \$1.66. The difference, then, between feeding a balanced and an unbalanced ration was an average profit, per steer, of \$8.98, with the former and an average loss, per steer, of \$1.66 with the latter; or \$10.64 per steer in favor of the balanced ration.

The results of the feeding test with 56 calves conducted at the Experiment

is one of the largest consignors to the auction, including about a dozen head of Prides, Queen Mothers and other good strains and sired principally by Invincible Blackbird a son of Heather Lad 4th and the cow Blackcap 4th a full sister to the noted bull Black Knight. Invincible Blackbird is one of the best bred Blackbird bulls that was ever in service in America and his get in this auction are uniformly good and demonstrate conclusively the value of his blue blood. George H. Maize, Happy Valley, Mo., consigns sons of Christo of Longbranch bred by the Messrs. Escher, sired by the famous Heather Lad of Emerson 2d and out of a Heather Bloom dam sired by Heather Lad of Turlington. The cows consigned by Mr. Maize are sired by Hot Staff, a Heroine that was bred by Mr. Elliott and sired by the Erica bull, E Rex, a son of Imp. Kabul.

Sixty head are catalogued for the auction and a full list of the consignors will be found in the advertisement. The various offerings should attract buyers of this breed to Kansas City at this time.

Hutchinson's Sale a Winner.

C. F. Hutchinson's sale of Poland-Chinas at Norton, Kans., Saturday, March 24, was a great record-maker for this breed of hogs in Northwestern Kansas. Although the day was very stormy, there were many buyers present, and the animals brought good prices. Thirty-two head brought an even \$1,000, an average of \$33.14. W. R. Dowling, of Norcatur, topped the sale with a 2-year-old sow at \$80. The next highest price was \$66 paid for a yearling gilt by R. H. Keir, of Oberlin, Kans. Col. Bert Fisher, of Topeka, cried the sale. Mr. Fisher is well known to the breeders of Northwestern Kansas and he always gets good prices. The following is a complete list of the animals sold and the prices paid there-for:

1. Ed. Inman, Oberlin.....	\$45.00
2. J. Hackney, Norcatur.....	39.00

The Great Hereford Combination Auction at Kansas City, April 4.

When such breeders as Gudell & Simpson, Scott & March, Dr. J. E. Logan, and others mentioned in the advertisement in this issue, unite for a combination auction, Hereford breeders generally understand that high class animals will be the rule there and that culs will not be in evidence and that fair treatment will be accorded in every way to all bidders and purchasers at this auction. The blood of the great Anxiety 4th, The Grove 3d, Imp. Improver, Hesiod 29th, March On, Columbus, and numerous other noted sires will be found concentrated in these animals. The Dr. Logan sale of fifty head on April 5, the day following this combination sale, renders this a grand time

A chestnut stallion colt sired by Es-

for those interested in Herefords and those desiring herd headers or to add attractive females to their herds, to take a trip to Kansas City. The character and quality of the various offerings will well repay them for it and we hope to see the auctions well attended.

The Heath Shorthorn Sale.

In this issue will be found the announcement of the seventh annual sale of Shorthorn cattle from the Heath ranch, two miles south of Republican City, Neb. The sale is on April 4, Wednesday, and will consist of some thirty head or more of young cows, heifers and bulls from this, one of the oldest established herds in southwestern Nebraska, and one of the best consignments ever offered. Nearly one-half of the offering is good, strong, lusty young bulls, from ten months old up. The young cows and heifers are nice young, well-bred animals, from a milking strain of cows, by well-bred sires, such as the straight bred Scotch bull Lancaster Royal 168270 by Imp. Prince Oderic, etc., Golden Victor Jr. 175464. While the latter bull is the sire of most of the offering, the cows old enough to breed are in calf to Lancaster Royal. Several are by Aberdeen Lad 154974 one of the grand herd bulls. In this sale are three fine Double Standard Polled Durham bulls that are ored along good dairy lines.

Besides the cattle, there will be sold a lot of high-grade Percheron horses and several teams of work horses and bled Poland-China gilts, farm implements and other utensils, thus making it a very important sale. The catalogue is out and will be sent on application. Send for it and come to the sale and it will be a day well spent, whether you buy or not.

The Butler, Mo., Sales.

U. S. Ison, M. G. Sellon and J. L. Gere combined their herds and made a sale of Poland-China swine and Shorthorn cattle at Butler, Mo., on Friday, March 23. Although hampered by unfavorable weather conditions which served to reduce the crowd of buyers, they made a fairly satisfactory sale of Poland-Chinas. The Shorthorn sale was disappointing.

Twenty-eight head of Poland-Chinas sold for \$905, averaging \$32.32. Eighteen sows and gilts averaged \$39.36 and 10 boars, 5 of which were late fall pigs, averaged \$19.65.

The 16 Shorthorns in the sale were nearly all bulls that ranged in age from August calves to 18 months old. Because of the rain and the small crowd, these cattle sold low. Those who bought hogs were H. H. Harshaw, Butler, Mo., R. E. Blatt, Clinton, Mo., T. A. Church, Lone Elm, Kans., W. G. Sellon, Butler, Mo., L. G. Thomas, Butler, Mo., L. T. Paddock, Butler, Mo., J. L. Gere, Butler, Mo., Jas. Brown, Butler, Mo., G. W. Taylor, Butler, Mo., D. V. Stall, Lone Elm, Kans., F. D. Winn, Mastin, Kans., and W. Woody, Butler, Mo.

Diamond Creek Horse Sale.

Hon. J. W. Creech, of Herington, Kans., held his second sale, comprising a draft of Standard-bred horses from his Diamond Creek stock farm. The offering consisted of a few brood mares, young stallions, geldings and youngsters. The sale was held at the farm adjoining Herington on March 26, and notwithstanding the disagreeable day there was a good attendance and splendid prices were realized and every thing catalogued sold except a few of the younger colts, besides a number of horses were sold that were not catalogued. Thirty-two head sold at an average of \$180.

The top price was \$685, for Anglebar 0707, the bay horse sired by Escobar, which went to C. A. Trueman, Ottawa, Kans. \$500 was paid for Montgomery Ward 35435, sired by Pilatus 2:09 1/4, which went to B. Hochensmith, Abilene, Kansas.

A chestnut stallion colt sired by Es-

cob sold for \$400 to J. B. Case, of Abilene.

The principal buyers of the sale were as follows: E. Hochensmith, Abilene; C. Q. Furnass, Ottawa; H. M. Cotten, Leon; J. B. Case, Abilene; Geo. Etherington, Abilene; C. F. Estes, Abilene; F. M. Robinson, Solomon; H. E. Bacon, Herington; S. P. Cookson, Junction; Dave Nail, Herington; Jacob Snyder, Abilene; A. B. Robbins, Abilene; G. S. Hoffman, Abilene; R. T. Rindt, Woodbine; R. Hollingsworth, Solomon; Theo. Sanderst, Enterprise; Allen Moyett, Herington; G. W. Nave, Herington; Fred Sanghoover, Herington; Dr. Conklin, Abilene; Henry Keel, Abilene; Henry Shaner, Herington; Jno. Pratt, Herington, Kans.

The New Home of Sutton's Doddies.

Mr. Chas. E. Sutton, who for many years has been prominent as a breeder of Aberdeen-Angus cattle and Berkshire swine at Russell, Kans., has lately moved his lares and penates to his farm near Lawrence, Kansas. Since this removal there has been no decrease in the demand for these "doddies." Sales lately made include 5 bulls to the Capital Syndicate of Texas; 1 to F. O. Cresswell of Texas; 1 to John Fitzpatrick of Texas; 3 to Dr. Garrett & Son of Wallace County, Kansas; 1 to John Meyer of Lincoln County, Kansas; 1 to Guy St. Aubyn of Russell County, Kansas, and an imported bull to H. A. Cole of Chicago. The latter sold for \$725. Sutton's blacks seem to spread out over the earth.

An Attractive Angus Auction.

Eight breeders of the "market takers" whose names will be found in the advertisement in this issue will unite in a combination auction at Kansas City on Tuesday, April 3, under the management of W. C. McGavock, of Springfield, Ill. T. J. McCreary, Highland, Kans., consigns seven head. The bull Black Knight of Highland 4th, a double Blackbird, has the distinction of being No. 1 of the catalogue. He was sired by Imp. Blackbird Baron of Advie, an Erica topped Blackbird, whose four grandsons and dams were bred by Sir George MacPherson Grant of Ballindalloch. Black Knight of Highland 4th was out of the double Blackbird cow, Blackbird of Highland 2d, and whose sire Black Knight of Estill 7th was a son of the great Heather Lad 2d, and whose dam Blackbird of Turlington 8th is the dam of Blackbird of Emerson the dam of the noted Blackbird bull, Black Monarch of Emerson. He is a bull of grand scale, and his pedigree is all that could be wished and, as he was a year old last September, he is just the age to do some breeding a lot of good. Another yearling son of Imp. Blackbird Baron of Advie, Mr. McCreary consigns in the Trojan-Erica, McCreary's Eric. He was out of a dam that traces maternally to Imp. Eone and was sired by the Abbess bull, Axtell of Estill. The dam of this bull is named Eona Mack and she is also included in the auction and due to calve before sale time to the service of the Blackbird bull. Three yearling queen mothers' daughters of this imported Blackbird bull are also catalogued by Mr. McCreary. They are good individually and their pedigrees are right. The outstanding Angus sire of to-day is Black Monarch of Emerson. A daughter of this bull was champion at the World's Fair, at St. Louis, and of the last two International Expositions, and as Black Monarch of Emerson died last year, his get are rendered all the more valuable and there are few of them to be offered at auction. R. S. Williams, Liberty, Mo., offers on this occasion a daughter of this celebrated bull in the four-year-old cow Miss Monarch Williams, and she was out of a daughter of Black Magic a full brother to Black Monk. Mr. Williams has sold at Kansas City, as many good cattle as have been presented there from the herd of any one Angus breeder. Last year at the show and

RUPTURE

New Scientific Appliance, Always a Perfect Fit—Adjustable to Any Size Person—Easy, Comfortable, Never Slips—No Obnoxious Springs or Pads—Costs Less Than Many Common Trusses—Made for Men, Women or Children.

Sent on Trial

I have invented a rupture appliance that I can safely say, by 30 years' experience in the rupture business, is the only one that will absolutely hold

C. E. Brooks, the Inventor.

The rupture and never slip and yet is light, cool, comfortable, conforms to every movement of the body without chafing or hurting and costs less than many ordinary trusses. There are no springs or hard lumpy pads and yet it holds the rupture safely and firmly without pain or inconvenience. I have put the price so low that any person, rich or poor, can buy, and I absolutely guarantee it.

I make it to your order—send it to you—wear it, and if it doesn't satisfy you send it back to me and I will refund your money.

That is the fairest proposition ever made by a rupture specialist. The banks or the postmaster here in Marshall will tell you that is the way I do business—always absolutely on the square.

If you have tried most everything else, come to me. Where others fail is where I have my greatest success. Write me to-day and I will send you my book on Rupture and its Cure, showing my appliance and giving you prices and names of people who have tried it and been cured. It is instant relief when all others fail. Remember I use no salves, no harness, no lies. Just a straight business deal at a reasonable price.

C. E. Brooks, 1630 Brooks Bldg., Marshall, Mich.

sale held there, he won the female championship and he this year offers a full sister and numerous daughters of her sire Zaire 17th, one of the best breeding bulls to be found in the country. The catalogue of this auction should prove interesting to all breeders and admirers of the Angus, and will be mailed on application to W. C. McGavock, sale manager, Springfield, Ill.

The Ashcroft Shorthorn Sale.

Perhaps the most attractive feature of the A. M. Ashcroft sale of Shorthorns which will be held at the home farm near Atchison, Kans., on April 10, will be the 27 solid, dark-red cows and heifers that will be offered safe in calf to their great herd bull, the pure Cruickshank Victoria, Scottish Minstrel 234970. This will be the only sale of the season, so far as we can learn, where such an array of good red cows will be offered that are bred to a pure Cruickshank bull.

The 15 bulls in this sale are as good as their sisters, and of the same solid colors. Five of these are large growthy chaps sired by Acomb Duke 18th who is well known as a breeder among Shorthorn men. The good bull, Harmony's Knight, is the sire of the ten younger bulls in the offering. He is also a Scotch bull and one of the best in Kansas. There will be free carriages at Carter's livery barn in Atchison ready to take buyers to and from the sale. Lunch will be served at noon and the sale will begin at 1:30 p. m. Remember the time and place and be there to get these cattle.

Do You Need a Bull?

If you are in need of a bull you should write Hoadeley & Sigmund, of Selden. They have only four bulls left and you can get them right. These gentlemen while new to Kansas people are old and experienced Shorthorn men, having started their herd eighteen years ago at Cedar Rapids, Iowa, and just recently moved it to Kansas. These gentlemen have spared neither time nor money in building up their herd. Much of their foundation stock was purchased from Secretary of Agriculture James Wilson when he dispersed his famous herd several years ago, and in the herd you will find animals from the famous families of Young Mary, White Rose, Pomona, Secret Arabella, Lady of Athol, Dalcibella, Young Phyllis, Wiley, etc., the get of some of the most noted sires in the West. The bulls they have left are either pure Scotch or Scotch tops, and range in age from eighteen to twenty-two months old. You can make no mistake by purchasing from them.

Southeast Kansas Breeders' Association Sale.

In the Shorthorn sale at Fredonia, Kansas, April 13, 1906, under the auspices of the Southeastern Kansas Breeders' Association, will be sold a number of pure Scotch cattle that will interest any of the best breeders of Shorthorns, in fact, all the offering are of breeding and merit that is desirable in any herd. Mr. Hanna, of Howard,

GOVERNOR 73392.

One of the great sons of Anxiety Monarch 63204. There will be sold at public auction on April 18, 1906, at Superior, Neb., about 50 head of choice Hereford cattle, consisting of cows sired by the great sire, Anxiety Monarch with calf at foot, and others in calf; also the blood of Ancient Britton and Vincent 2d 42942, both World's Fair winners in 1893; also sons of the great Beau Donald 28th 105168. Breeders of Hereford cattle this sale is worth your attention. For catalogue write W. N. Rogers, McCook, Neb.

Warranted
to give satisfaction.

GOMBault's CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all bunches from Horses or Cattle.

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.
Each bottle of Caustic Balsam sold is Warranted to give satisfaction. Price \$1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE LAWRENCE-WILLIAMS COMPANY, Cleveland, Ohio.

has imported more high class herd bulls than any other Western breeder and the cattle in this sale are largely by the great bulls he imported: Mariner, Collynie, Lord Cowslip, Inglewood and other great sires were bought in Scotland by Mr. Hanna and if it is said an animal is Hanna bred it is a guarantee of an individual of superior merit. Mr. Hanna has selected some excellent cattle for this sale as have the other consignors. Besides the animals by the Hanna bred or imported bulls will be some of Imported Choice Goods, Imp. Lillycrairn, Battle Ax, Golden Victor Jr., Scottish Emperor, etc.

The consignors have all been for months planning this sale and have reserved and fitted their consignments especially for this sale. If you have not yet received the catalogue, address H. E. Bachelder, secretary, at Fredonia, Kansas, or either of the consignors at their respective addresses, and kindly mention THE KANSAS FARMER.

The Johnson County Breeders' Association Sale.

The Johnson County Breeders' Association will hold a cattle sale at Olathe, Kansas, April 6, when they will sell 40 cattle, 32 Shorthorns and 8 Herefords, about equally divided as to bulls and females. Mr. Hayes, secretary of the association, has selected 6 head from his herd of good ones and the other consignors are all selling an excellent lot of useful, well-bred cattle. J. S. Fergus is selling his herd bull, Admiral, bred by E. O. Cowan and sired by Velvetine Prince. Also a 3-year-old heifer by the great Alice's Prince and a young Phyllis bull out of a Duncan bred cow. J. S. Hoover sells 3 cows and heifers tracing to Imp. Alexandria 6th, bred by W. S. Marr. Mr. Hayes sells a young Mary cow bred by C. C. Norton, of Iowa, close to calving, bred to Lord Bauff 2d, a son of Imp. Lord Bauff.

Two other good cows, one by Cherry Grand Duke 2nd with roan cow calf at foot by Lord Bauff 2nd. The other tracing to Imp. Adelaide with cow calf at foot by Royal 167522 a Crulckshank Victoria bred by Cal. Haines; a young easey cow, bred to Lord Bauff 2nd, is also included.

The Herefords are well-bred cattle, descendants of animals from the herds of some of the best Missouri breeders and have been selected for this sale by their owners, realizing that the good ones alone are wanted. Send at once for catalogue to H. E. Haynes, secretary, Olathe, Kansas. Kindly mention THE KANSAS FARMER.

Shorthorns at Atchison.

The uniformity of A. M. Ashcraft's sale offering of Shorthorns is noticed by all who have seen them. If you will notice the line of breeding that produced them, it will be found that they have descended from two imported families of Young Marys and Galatea and have all been sired by the herd bulls used in the herd. The cows and heifers are a very even, all-red lot and all in calf to the good son of Imp. Scotch Mist, Scottish Minstrel, a pure Scotch bull of great beef character. The hull portion of the offering consists of 15 head, 5 great big strong fellows ready for pasture or range use and the others are just about a year old of the blocky, easily-fleshed type so much in demand. If you have not yet received the catalogue, write a card to Mr. Ashcraft, Atchison, Kansas, asking for the same.

Howey's Public Sale.

On Wednesday, April 4, at his farm southeast of Topeka, Mr. V. B. Howey, will sell a draft from his herd of Poland-China swine. In this draft there will be included 13 head of herd sows and gilts. There will also be seven boars, two of which are his herd boars, Klondike Jr., 63129 and Proud Ryes Sunshine 63002. This will afford an excellent opportunity for buyers to get some of the stock which Mr. Howey has bred so long and so successfully. At the same time and place, Mr. Howey will sell 3 head of milk cows and 3 helpers that will be fresh in the summer; also a span of black horse-mules coming two year old. A number of agricultural implements, including a 3 horse-power gasoline engine, will also be sold. Remember the time and place

and meet Mr. Howey at his sale. One of Mrs. Howey's famous lunches will be given the buyers at the noon hour.

Gossip About Stock.

E. A. Kramer, of Plainville, Kans., is just starting in the hog business. He has gathered in several good sows and judging from the animals he has purchased, is an excellent judge of hogs, which is one of the necessary qualifications for a successful breeder. Mr. Kramer will have some good foundation stock to offer the public this fall.

C. G. Cochran and Sons, of Plainville, Kans., are starting a fine herd of Short-horns. We bespeak for these gentlemen a successful business. Mr. C. G. Cochran is president of the First National bank of Plainville and one of the successful business men of Western Kansas.

N. F. Shaw, of Plainville, Kans., has what is said by judges of good cattle to be one of the best herds of Short-horns in Kansas. Mr. Shaw has recently headed his herd with a son of Gallant Knight, which he purchased from T. K. Tomson & Sons, Dover, Kans.

Saunders & Maggard, of Flemingsburg, Ky., have recently shipped to Salina a carload of Kentucky Jacks, where they will be sold at private sale. If you need an animal of this kind it will pay you to see these Jacks. They are the large, heavy-boned individuals, and good breeders. No one can make any mistake by purchasing a jack at this time. The demand for mules is far greater than the supply and they are bringing high prices. If you will buy a good jack such as these gentlemen have, you will have no trouble in getting all the work he can do. Go to Salina and see them. Saunders & Maggard.

Wilkie Blair, owner of the Beulah Land Farm Herd of Red Polled cattle, writes as follows: "My ad. in the KANSAS FARMER has brought me many inquiries for Red Polled cattle. One man wants a carload of bulls. I have recently made the following sales: Two-year-old cow to S. V. Mulkey, Waynoka, Okla.; yearling heifer to W. J. Johnson, Hiattville, Kans.; bull calf to Chas. Puterbaugh, Iroquois, S. D. I have three choice bulls nearing a year old for sale, and some younger ones which will make herd-headers, out of cows winning at the St. Louis World's Fair, and sired by our herd bull, Linwood Lad 9492—K. 25, who won 2d in class at 2-year-old, and at head of aged herd, winning 3d at World's Fair, his sire being the famous Majololini 3600—L. 9, who won the Royal championship two years in succession. These young fellows are the best ever bred at Beulahland."

G. E. Newton is the successor to the firm of Newton Bros., Whiting, Jackson County, Kansas, which partnership was dissolved on March 8, 1906. Mr. G. E. Newton, who has been the active and responsible member of the firm, makes the following statements: "In order that all who may be interested may understand exactly, I will give a brief history of the herd and myself. I was born in Illinois, but I have lived in Kansas 33 years. Ever since I was 12 years old I have owned and fed stock (cattle and hogs). I have been manager for the herd since it was established; I did all the buying and selling. The breeding and feeding was also done under my direct supervision, when I did not do it in person. My brother and past partner did not take to the occupation and desired to try other business, hence our separation. The herd of hogs was established February 10, 1898. Two years later my brother came in with me. The E. P. Rocks was added in 1899. We always carried a herd of choice high-grade Shorthorn cattle, but in October, 1904, we sold these cattle and I invested personally in some choice registered Shorthorn cattle. Previous to 1898 I handled Poland-China swine for six years. From 1898 up to date I have personally sold over 1,400 head of Durocs for breeding purposes, besides all culs that went to market."

We wish to thank all our customers for favors and courtesies extended to the firm of Newton Brothers, and will say that all who do business with me in the future will deal just as they did when we were in partnership, as I was the one you all bought or sold to. If square dealing will merit your patronage and friendship, I shall be confident of your business and friendship in the future. Address all letters or cards in the future to G. E. Newton, Whiting, Kans., Route No. 1.

The Farmer and the Hen.

Census reports show that 88½ per cent of American farmers keep poultry. Why the other 11½ per cent don't is something of a puzzle, because the farmer usually has an eye to the main chance. Every man with an acre of ground at his disposal ought to get ready for the coming boom in the poultry business. Demand is constantly forcing increased production, and it is no exaggeration to say that the value of poultry products in the United States will soon pass the three hundred million mark. If this is so, why not learn the secret of poultry success, and get your share of profit? It is a fact worth noting that successful poultrymen always give their laying stock a daily dose of Dr. Hess Poultry Pan-a-ce-a in the feed. They would tell you that this is almost as necessary as the feed itself, and back their contention with abundant proof in the way of results. This method has reason and common sense back of it, because it is impossible for the hen in confinement to get the elements Nature intended for growth maintenance, and egg-production, and even when at liberty she still needs the correcting and invigorating influence of such a tonic.

Dr. Hess Poultry Pan-a-ce-a meets this need by supplying iron to the blood, and nitrates to help Nature in

throwing off all poisonous substances. You can readily see if these necessary elements are given, the hen must be healthy and prolific. Experience has proved again and again that no flock can be diseased when Dr. Hess Poultry Pan-a-ce-a is given as directed. A very little once a day in soft feed, compels the hen to fully digest her food, and use each part in just the way Nature intended, so that bone, flesh, feathers and eggs are each provided for in a healthy and natural manner without taxing the vitality of the hen.

For these reasons Poultry Pan-a-ce-a (prepared by Drs. Hess and Clark, of Ashland, Ohio) is a guaranteed egg-producer. A careful test will prove its value. Separate a few hens for two weeks' time and give them Dr. Hess Poultry Pan-a-ce-a as directed. Compare this performance with that of an equal number of hens which have none of this preparation, for the same period, and you will have no doubts of its value as an egg-producer. Drs. Hess and Clark are so sure of the remarkable results to be had from the use of Poultry Pan-a-ce-a that they give a written guarantee with every package. If it does not pay you several times its cost, they cheerfully return your money. If you are in the poultry business for profit you can not afford to get along without Dr. Hess Poultry Pan-a-ce-a. Use it every day, and occasionally sprinkle hens, nests, and roosts with Instant Louse Killer, if you want results.

"It Makes Stock Thrive."

And that's what you want—thrifty stock, for "Thrifty stock makes a thrifty farmer." Standard Stock Food has been used by hundreds of thousands of farmers for more than twenty years to improve the appetite and promote the digestion of all live stock. It makes the feeding ration more palatable, improves the appetite, stimulates the flow of all digestive juices—enabling the animal to get more good from the ration, and making the ration go farther. Many of our readers are now using it with most satisfactory results; they prefer the standard—not only because it does the work so well, but also because of its economy; a dollar's worth of it contains more feeds than a dollar's worth of any other. Better results for less money. If you are not using the Standard, ask your dealer about it. If he does not handle it, send his name to the Standard Stock Food Co., 1500 Howard St., Omaha, Neb., and tell how much stock you keep, and the manufacturers will send you their 160-page book, "The Standard Feeder," full of practical, every-day suggestions for making more money from your stock of all kinds.

P. R. Coseman, Newark, N. J., writes: "If I had known of Dr. Sloan's Nerve and Bone Liniment previous to August 29, I should not have passed so many sleepless nights. On that date I slipped from a step-ladder and bruised my left arm and shoulder. The doctor assured me that no bones were broken, but that the muscles and nerves were strained, which in his opinion was worse than a break. After using several dollars' worth of prescriptions, without any result whatever, I concluded that I should always be a cripple. On December 12, I stepped into a drug store and got a 25 cent bottle of Sloan's Liniment, and the instant that I applied it as per directions, I got relief; in fact it acted like magic. I have now only used it seven days and my arm is almost well. The liniment can not be too highly recommended, and I shall make it a point to solicit the trade to keep it whenever I can do so."

Topeka Business College News Items

New Term begins April 2, 1906.

Nine students went from school into positions last week.

Students from this school took positions in fifteen States and three Territories last year.

In addition to placing all graduates the school also placed in positions the past year ninety-four students who had not yet completed the course.

O. D. Wilkerson, of Washington, D. C., is visiting in Topeka. Mr. Wilkerson is a fluster and has made steady advancement in the civil service since completing his course at T. B. C.

Chas. Fleisch, the youngest graduate of this school, was among the visitors recently. Charlie now has a position with the Colorado Iron and Fuel Co., at Pueblo, Colorado, at \$1,800 per year.

Mr. Edward Bartel, who, after leaving school had considerable experience as stenographer in the City of Mexico, and Central America, is now located at Mansfield, La. Ed's visit last Friday was much appreciated. He always has a lot of interesting things to tell.

Students who took positions last week:

Miss Lillian May, Bookkeeper, with Ewart Lumber Co.

Miss Anna Tucker, Stenographer, with Hypes Supply Co.

Mr. O. Ritchie, Stenographer, with Mall and Breeze.

Mr. Carl Blecha, Stenographer, with Topeka Bridge & Iron Co.

Mr. Arch Brunton, Stenographer, Rock Island Offices.

Mr. W. Wallace, Stenographer, A. T. & S. F. General Offices.

Miss Bertha Louis, Telegrapher, Postal Telegraph Co.

Mr. Clarence Dreyer, Telegrapher, Postal Tel. Co.

Mr. Geo. McCleery, Telegrapher, Santa Fe at McIver, Kans.

I CAN CURE CANCER

At Home Without Pain, Plaster or Operation and I Tell You How, Free.

I Have Proven Cancer Can be Cured at Home No Pain, No Plaster, No Knife---Dr. Wells

I have discovered a new and seemingly unfailing cure for the deadly cancer. I have made some most astonishing cures. I believe every person with cancer should know of this marvelous medicine and its wonderful cures and I will be glad to give full information free to all who write me tell me about their case.

Peter Keagan, Galesburg, Ill., had cancer of the mouth and throat. Doctors said, "no hope." Mr. Keagan wrote: "It is only a question of a short time—I must die." To-day his cancer is healed up and he is well. My marvelous raditiatived fluid did it. It has other just such cures to its credit. It is saving people every day and restoring them to health and strength. If you have cancer or any lump or sore that you believe is cancer, write to-day and learn how others have been cured quickly and safely and at very small expense. No matter what your condition may be do not hesitate and tell me about it. I will answer your letter promptly, giving you absolutely free, full information and proof of many remarkable cures. Address, Dr. Rupert Wells, 1251 Granite Bldg., St. Louis, Mo.

You Must Sleep.

If you cannot, it is due to an irritated or congested state of the brain, which will soon develop into nervous prostration.

Nature demands sleep, and it is as important as food; it is a part of her building and sustaining process. This period of unconsciousness relaxes the mental and physical strain, and allows nature to restore exhausted vitality.

Dr. Miles' Nervine brings refreshing sleep, because it soothes the irritation and removes the congestion.

It is also a nerve builder; it nourishes and strengthens every nerve in your body, and creates energy in all the organs.

Nothing will give strength and vitality as surely and quickly as Dr. Miles' Nervine.

"During the past winter I had two attacks of LaGrippe which left me very weak, and in bad condition. I was so nervous I could not sleep. My wife, after trying different remedies, went for a doctor. The doctor was out, and a neighbor recommended Dr. Miles' Nervine, and she brought home a bottle. I had not slept for some time, and had terrible pains in my head. After taking a few doses of Nervine the pain was not so severe, and I slept. I am now taking the second bottle, and am very much improved." HENRY M. SMITH, Underhill, Vt.

Dr. Miles' Nervine is sold by your druggist, who will guarantee that the first bottle will benefit. If it fails, he will refund your money.

Miles Medical Co., Elkhart, Ind.

Remarks About Birds in Regard to Fruit and Insects.

BY ELBERT S. TUCKER, MUSEUM ASSISTANT IN SYSTEMATIC ENTOMOLOGY, UNIVERSITY OF KANSAS, LAWRENCE.

Much argument has been spent in advocating the protection of song-birds for the service they bestow in feeding extensively on insects largely injurious, but the fact remains that their depredations to many kinds of fruit, when it becomes ripe, presents a serious side to the subject. Since my article entitled "The Destruction of Fruit by Birds in Sedgwick County," was published in the KANSAS FARMER of November 20, 1902, I have been anxious to learn what tendencies are exerted by birds in their relations to fruit and insects in other parts of Kansas and in other States, particularly of the West, and have accumulated various short references, which being reproduced here, contribute to a further consideration of the question through expressions of the views of other observers in addition to my own remarks. A notice that has evoked my attention at this time appeared in the Lawrence World of December 20, 1905, and read to this effect:

"The following press dispatch, dated at Champagne, Ill., appeared in a morning paper: 'Because the students of the Kansas University, at Lawrence, hunted and killed birds that ate insects, and robbed their nests in pursuing their studies, that section of Kansas has not had an apple crop for six years,' was the statement of B. F. Smith, of Lawrence, before the Illinois State Horticultural meeting held in this city. Not all the damage was done by the students; other boys and hunters helped to exterminate the bug-eating, winged creatures until the State, at the last session of the legislature, passed a law prohibiting hunting without permission of the landowners."

The charge against the students of the University, at least as applying to recent years, was, however, emphatically denied by Professor L. L. Dyche, curator of the bird collections.

To prove that birds have been plentiful in Douglas County, if not too much so, even within the period mentioned, a complaint of their destruction of fruit which came to notice in the Lawrence Journal of June 26, 1903, is here produced:

"Mr. Greenlees, southeast of town, who has a large amount of berries, says that flocks of blackbirds are taking his berries as fast almost as they ripen. This is not a new complaint, for the blackbirds is sometimes almost as great a nuisance as the English sparrow."

In making direct inquiry to the source of this report, I received this answer: "Your card of inquiry about the blackbirds is received. In reply will say they helped themselves quite freely to my raspberries for a short time and then left as suddenly as they came. The loss was trifling and not worth reporting. Yours respectfully,

"A. GREENLEES."

As the extent of land now covered with trees and shrubs is much greater than in former years with respect to Douglas County as well as elsewhere in the State, the spread of arboreal influences would indicate that birds should be more numerous than ever known before; as least, such has been the case in Central and Western Kansas. The amount of loss inflicted on fruit by birds depends on local conditions to a great degree. On the prairies, wild fruit is seldom found, hence the birds are greedily attracted by cultivated varieties. Their attacks on grapes raised in this region are especially severe. Each year only brings a repetition of their plunders in the same manner as described in my former article treating of observations in Sedgwick County. During the last few seasons, however, the yield of grapes has been slight, but whatever there was, the birds got the most of it when not protected. Here the fruit-grower can not afford to bear the loss of a considerable portion, or perhaps the greater part of his crop, out of pure sentiment for the birds.

Wholesale slaughter may seem to be a terrible recourse to enforce against the birds, but either the birds must be subdued or the growing of certain fruits abandoned in those sections. Possibly a remedy or mitigation for the trouble may be provided in time by the raising of mulberries or something else to satisfy the bird-appetite, but it can not be for present purposes. While the amount consumed by a single bird is

trifling, the extent of all losses incurred results from the combined attacks of a great number of one or more kinds. Examinations of the stomach contents of birds accused of marauding in orchards and vineyards have failed to show that they eat scarcely more than perceptible amounts of fruit in proportion to other food. However, birds are sometimes the means of destroying far more than they actually eat. The slight evidences of either fruit or its seeds being found in the stomachs of those examined does not by any means indicate the wanton tendency exerted in their attacks upon grapes, or, if such evidence be entirely lacking, should they be considered innocent of doing any damage at all, when instead, as I shall show, they can be guilty of causing extreme havoc. Why these investigations fail to sustain the condemnatory charges against the birds is, in my opinion, because the birds do not eat grapes, unless rarely; they merely take a sup or two of juice from each berry which is ripped open, one after another, in rapid succession, thereby ruining whole bunches. All they generally swallow, then, is a little juice. My conclusions to this effect are based on frequent observations of birds while attacking grapes on the vine. Besides the wrecked bunches tell the story plainly enough. Regarding this trait, I have found no mention in reports of Government investigators or otherwise, though the advisability of having ponds or other supply of water available to birds in hot, dry weather, has been suggested. Perhaps this is a matter of thirst rather than appetite.

Judging from the experience of a lady living at Kinsley, Kansas, the prospect of growing grapes to maturity that far West appears practically hopeless. Some grape-vines had been trained on a trellis in the yard near her house, and they bore abundant fruit, but she never succeeded in saving any from the birds unless she picked the grapes before they fully ripened. One year the lady tied strong paper sacks over the bunches just before the time of ripening; yet the birds soon ripped them open with their beaks and riddled the fruit. Next year she provided bags made from a strong quality of cheese-cloth in the belief that the birds would surely be unable to penetrate a covering of this strength; how keenly her disappointment was felt, when, after all her trouble, she found that the birds actually forced holes into these bags with their bills and thus managed to reach and spoil the fruit within!

As evidence of how the matter is regarded by other observers, two of whom are experienced specialists in the study of birds, their comments on my former article, including suggestions for remedial measures, should show for themselves, although this will require the reprinting of all except the communication of Professor Bruner which has not been published before. His letter was written from the Department of Entomology and Ornithology of the University of Nebraska, at Lincoln, under date of December 15, 1903, and from which his words are quoted:

"Allow me to thank you for the paper on the destruction of fruit by birds in Sedgwick County, which you have so kindly sent me.

"I, myself have never seen anything to begin to compare with it on the prairies of Nebraska and I have watched birds a great deal for the past twenty-five or thirty years."

"In my talks concerning bird-protection, I suggest the planting of the Russian mulberry and other wild fruits which birds are fond of, since I have observed that wherever they have access to wild fruits they seldom pay any attention, or at least very little, to the cultivated varieties. Then, too, the placing of water where the birds can have access to it seems to assist in quenching their thirst during the hot days of late summer and early fall.

"Yours very truly,

"LAWRENCE BRUNER."

The following letter was printed in the KANSAS FARMER of January 29, 1903, under the heading, "Birds and Orchards."

"Mr. E. S. Tucker, Kansas State University, Lawrence, Kans., writes as follows:

"In referring my article published in the KANSAS FARMER of November 20, 1902, to the U. S. Department of Agriculture, the following reply has been received, which I submit for the benefit of your readers:

"U. S. Department of Agriculture, Biological Survey, Washington, D. C. E. S. Tucker, Lawrence, Kans.

"Dear Sir:—Your favor of the 6th instant, and the article on "The Destruction of Fruit by Birds in Sedgwick County," has been referred to me for

consideration. If you will turn to page 33 of bulletin 54, "Some Common Birds in their Relation to Agriculture," U. S. Department of Agriculture, you will find that I have there described in general terms the situation of which you have given a specific example. The conditions are artificial and abnormal in every respect. When, in addition to the orchards and vineyards, artificial forests, with their accompanying fruit-bearing shrubs, shall have grown, the present trouble will practically cease. In the meantime I do not see that there is any other remedy than the one that was applied, much as I deplore such destruction of bird-life. Too many birds were collected in a limited area with the usual result. It is evident that the killing did some good as the birds were less destructive last season.

"The fruit-growers of California have been for several years struggling with the same problem but the conditions are slowly becoming more normal, in fact so much fruit is raised there that it is only in small orchards that the damage by birds is noticed.

"As I have stated elsewhere, the damage by birds usually arises from too many birds, or too many of one or a few species, collecting in a limited area. Under such circumstances the natural food-supply becomes insufficient and the birds turn their attention to other sources of supply with the consequence, usually, that some agricultural product has to suffer.

"I send herewith a copy of bulletin 54, also "How Birds Affect the Orchard," which shows the other side of the case.

F. E. L. BEAL.

"In charge Economic Ornithology."

Under the heading, "Birds and Grapes in McPherson County," the following statement appeared in the KANSAS FARMER, issue of December 4, 1902:

"EDITOR KANSAS FARMER:—I was much interested in reading an article written by E. S. Tucker, in the issue of November 20. I give my experience with fruit and birds here in McPherson County. I have been here thirty years. I find that grapes are the surest fruit we can raise. They bear every year, but I do not expect any unless I stand over them with a shot gun from the time they begin to color until they are all gone and we have to gather them before they are ripe to get any at all, because I can not watch them all the time. I will have to give up grapes unless the brown-thrushes, catbirds, and orioles are killed off. We have not many robins or mocking-birds. The orioles are the most numerous and worst.

B. REICHART.

"McPherson, Kans."

Another statement from the same person appeared just recently (in issue of February 22, 1906 KANSAS FARMER,), under the heading, "Fox Squirrels—Birds and Fruit," which presents the situation up to date:

"EDITOR KANSAS FARMER:—We have plenty of what they call fox-squirrels here. They are great on sweet corn when in the roasting-ear stage; they also help themselves to corn in the crib and take care of all the walnuts.

"We also have many fruit-eating birds. They will not let a cherry or grape get ripe if they can help it. We have a good many rats here. I would rather feed rats on corn than feed birds on fruit. Now, if one is protected by law, why not protect all three, for one is as good as the other as far as usefulness is concerned. Our apples are nearly all wormy in spite of all the birds that are here. Do we not have a right to protect our crops, law or no law?

B. REICHART.

"McPherson County."

Then again in the next issue of the KANSAS FARMER (March 1), there appeared an inquiry from a correspondent in Montgomery County, who, in asking how to prevent loss of seed-corn caused by birds and other animals, intimates that birds are serious offenders in this respect.

My own contentions with birds began when I was a boy on an Ohio farm, where, in cherry time, I was sent out with an army musket and a supply of powder and shot with which to shoot the birds that came to eat the fruit. A few shots with the old gun that "kicked" at every discharge was generally sufficient to appease even a boy's ardor for shooting, and further watchfulness was induced more by the prospect of a feast on savory bird-pie to be made by grandmother should enough birds be killed, rather than for the sake of saving the cherries. Out in Kansas, however, where cherry-trees were grown after years of waiting, and the yield at first was scant as could only be expected from young trees, the persistent raids of the birds, which scarcely left any fruit long enough to become ripe, was indeed discouraging.

An opinion frequently advanced by

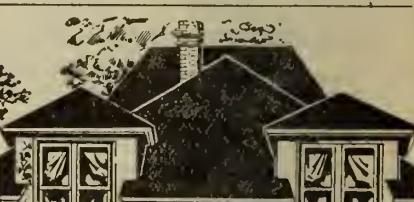

Kill your ducks—

don't cripple them. Shoot U. M. C. duck shells—not others almost as good. Arrows or Nitro Clubs loaded with any smokeless powder are hard hitters.

U. M. C. cartridges are guaranteed, also standard among when U. M. C. cartridges are used as specified on labels.

BETTER-CHEAPER ROOFING

Have you ever paid a high price for roofing and then had it leak within a year or two? There is *only one* way you can prevent this from occurring again—by buying a roofing that is *made right*; one in which materials are used that will not rust or decay. Therefore no leaks.

Mica-Noid
READY ROOFING

is a long wool fibre thoroughly saturated with a water-proof preparation by our own "damp-proof" process, which years of test in all climates have proved will resist water and decay. We want you to know why users of Mica-Noid prefer it to tin, shingles, iron or any kind of roof material.

We want to send you copies of letters from these users; also FREE samples of roofing. They speak for themselves.

ASBESTOS MFG. & ROOFING CO.,
306 Carr Street, St. Louis.

CONGO ROOFING

A ready roofing that is warm, dry, easy to lay and lasting.

In appearance it looks like rubber and it is as water-tight as rubber—but there is where the resemblance ceases.

Its wearing qualities are unsurpassed—it is a splendid fire resistant—acids and alkalis have no effect upon it. It doesn't rot out nor crack. It is pliable and elastic to the end of its days.

Good for any climate, any weather, anywhere on earth.

Write for free Sample and Booklet to-day.

WELL DRILLING MACHINES

Over 50 sizes and styles for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engine or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.

WILLIAMS BROS., Ithaca, N. Y.

Farmer's Account Book and Ledger

Saves time and labor—a few minutes each day will keep it; systematizes farm accounts in every department; shows in the simplest manner how to increase profits and decrease losses; endorsed by farmers everywhere. We stand ready to refund the purchase price on every book not found satisfactory. We deliver this book postpaid, including the Kansas Farmer one year, both for only \$2.50. Address,

THE KANSAS FARMER CO.,
Topeka, Kan.

Inexperienced persons is that if some object of dread to the birds were placed in a tree, the birds would be afraid to alight there. But that "something" possessing any merit for protective effect has never been found; instead, anything unusual attracts more birds than common, at least as far as a trial of old or stuffed clothes has proved; and furthermore, the humorous experience of John Burroughs as told in his book, "Birds and Bees and Other Studies in Nature," is repeated here to show the fallacy of such notions.

"One season, to protect my early cherries, I placed a large stuffed owl amid the branches of the tree. Such a racket as there instantly began about my grounds is not pleasant to think upon! The orioles and robins fairly shrieked out their affright. The news instantly spread in every direction, and apparently every bird in town came to see that owl in the cherry-tree, and every bird took a cherry, so that I lost more fruit than if I had left the owl indoors. With craning necks and horrified looks the birds alighted upon the branches, and between their screams would snatch off a cherry, as if the act was some relief to their outraged feelings."

Mr. Burroughs' writings on birds, particularly his chapters on "Bird Enemies," and "The Tragedies of the Nests," in the book just mentioned, tend much to incite the sympathy of the reader for these creatures of precarious lives. Yet in Kansas, as in other parts of the West, there are fewer enemies to prey on the birds and their eggs than in the East under such conditions as Burroughs observed. On this account they are more successful in breeding here. All of the writings of Mr. Burroughs furnish wholesome reading, but his choicest papers, probably, are contained in the volume, "Birds and Bees and Other Studies in Nature." There are two editions of the book, one in half-leather binding at 60 cents per copy, the other in linen covers at 40 cents. Besides his paper entitled "Sharp Eyes," an essay on how to observe things in Nature, the author not only touches on birds and bees in this work, but extols the potency of fruit and flowers, and of streams, meadows and woodlands with such charm as to captivate the heart of any true lover of Nature; or perchance, the reader is reminded of familiar scenes or out-door pleasures, possibly of childhood days, with a homesick feeling. Still, after all, we who live in Kansas need not lack for natural sources of enjoyment, though they may not be just the same as portrayed by Mr. Burroughs; we have plenty to rejoice in and would not exchange places.

Trade of the United States with Europe.

Europe takes two-thirds of the exports of the United States and supplies practically one-half of the imports. This statement summarizes in a single sentence the general facts which have been developed by a series of discussions of the trade of the United States with the countries of Europe recently presented by the Department of Commerce and Labor through its Bureau of Statistics.

These discussions have presented an analysis of the trade with each country of Europe by principal articles, and when summarized show that Europe takes more than a billion dollars' worth of the exports from the United States, while all other parts of the world takes a little less than a half billion dollars' worth. In no year since 1899 have the value of exports to Europe fallen below \$1,000,000,000, while that to all other countries has never touched the \$500,000,000 mark. Prior to 1900 the exports to Europe had never been as much as \$1,000,000,000 in value; in that year they crossed the billion-dollar line, being \$1,040,000,000, and have since that time averaged about \$1,050,000,000 per annum. In 1900 the exports to all sections of the world other than Europe were \$254,000,000 in value, but have grown year by year until in 1905 they were \$498,000,000, the growth since 1900 in exports to the non-European countries having been proportionately greater than that to Europe.

On the import side Europe supplies, as already indicated, about one-half of the merchandise brought into the United States. Prior to 1890 the share of the imports drawn from Europe averaged about 55 per cent; about 1890 the average was a little more than 50 per cent; in 1905 it was 48.4 per cent. This reduction in the percentage of the imports drawn from Europe is apparently accounted for by the growing demand in the United States for tropical and subtropical products which are supplied almost exclusively by the other grand divisions of the world. The value of

tropical and subtropical products brought into the United States in 1905 was \$508,000,000, against \$303,000,000 in 1895 and \$218,000,000 in 1885. Most of this class of imports comes, of course, from the non-European sections of the world; much of it from South America, especially coffee and India rubber; much of it from the southern part of North America, especially sugar, sisal, and tropical fruits; a considerable part from Asia, including tea, raw silk, and spices, while Oceania contributes sugar, spicess, cocoa, and other products of this character, and Africa Egyptian cotton, India rubber, hides and skins, and a small supply of sugar.

The trade of the United States with Europe is composed on the import side chiefly of manufactures and materials for use in manufacturing; on the export side of food stuffs, manufacturers' materials, and manufactures. The manufactures imported from Europe are chiefly the higher grades of cotton, silk, and wool fabrics into which labor, and in many cases hand labor, largely enters; while chemicals, certain grades of iron and steel manufactures, toys, wines, china and porcelains, cut- and plate-glass, and other articles of this kind contribute largely to the grand total. In addition to this, however, there are imported from the European countries certain articles the product of their respective colonial possessions, including India rubber, fibers, tobacco, hides and skins, wools, tin, raw silk, diamonds, and various tropical and subtropical productions. The articles exported to Europe are chiefly breadstuffs, meats, and live cattle, and fruits, for food; raw cotton for use in manufacturing, and a variety of manufactures, including copper in pigs, bars, and ingots, mineral oil, agricultural implements, boots and shoes, manufactures of wood, oil-cake, cottonseed oil, vegetable oils, naval stores, and various manufactures of iron and steel.

Of the \$1,021,000,000' worth of merchandise sent to Europe in 1905, 239,000,000 was manufactures, the other \$782,000,000' worth being largely food-stuffs and manufacturers' materials. With the growing tendency of our steadily increasing population to consume at home a larger share of the foodstuffs produced in the United States, and to increase the consumption by our own factories, the supply which can be spared for Europe is decreasing rather than increasing, and as a consequence the percentage of exports sent to Europe is slowly decreasing.

Prior to 1887 the share of our total exports sent to Europe was over 80 per cent; since that time the percentage has gradually fallen until it reached 72 per cent in 1902, and in 1905 was but 67.23 per cent of the total, while the share of the exports taken by those grand divisions to which the exports are chiefly manufactures shows an increased percentage in 1905 compared with 1904.

The fourth annual meeting of the Kansas City Alumni Association of the Kansas State Agricultural College, was held in the Pepper Building Friday night. The president of the college, Prof. E. R. Nichols, made the first short talk of the evening. He was followed by the following alumni: C. V. Hollister, '95, Rosedale; J. R. Harrison, '88, and B. L. Short, '82, Kansas City, Kans.; and Dr. A. T. Kinsley, '99, Kansas City, Mo. The speeches preceded a buffet luncheon. It is the hope of the association to hold more frequent meetings than it has in the past and to have some special feature for each meeting. About eighty graduates and former students were present. B. L. Short, '82, of Kansas City, Kans., was elected president; Miss Bertha Bacheller, '88, vice-president; and Dr. Geo. W. Smith, '93, secretary and treasurer. The Industrialist.

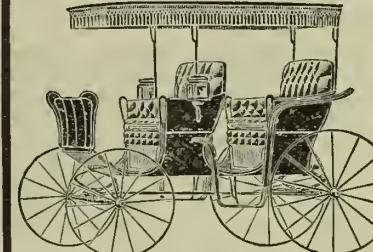

The zoological and animal husbandry departments of the Kansas Agricultural College, recently secured thirty Oregon pheasants from the State Game Warden at Pratt, Kans. The birds are for experimental work, and if the departments are successful in raising them, the birds will probably be liberated on the college farm. The State Game Warden is endeavoring to introduce the pheasants into Kansas and is interesting parties in the raising of them in the hopes of, in time, stocking Kansas woods with the birds. Industrialist.

Sin and happiness certainly do not travel on the same car, for they are not journeying on the same road.—N. Y. Observer.

CONDUCTED BY RUTH COWGILL.

Twenty Years Ago.

I've wandered in the village, Tom, I've sat beneath the tree,
Upon the schoolhouse playground that sheltered you and me;
But none were left to greet me, Tom;
and few were left to know,
Who played with us upon the green,
some twenty years ago.

The grass is just as green, Tom; bare-footed boys at play
Were sporting just as we did then,
with spirits just as gay;
But the "master" sleeps upon the hill,
which, coated o'er with snow,
Afforded us a sliding place, some twenty years ago.

The old schoolhouse is altered now;
the benches are replaced
By new ones, very like the same our penknives once defaced,
But the same old bricks are in the wall, the bell swings to and fro;
It's music just the same, dear Tom,
'twas twenty years ago.

The boys were playing some old game,
beneath that same old tree;
I have forgot the name just now,—
you've played the same with me,
On that same spot; 'twas played with
knives, by throwing so and so;
The loser had a task to do,—there,
twenty years ago.

The river's running just as still; the willows on its side
Are larger than they were, Tom; the stream appears less wide;
But the grapevine swing is ruined now, where once we played the beau,
And swung our sweethearts.—pretty girls,—just twenty years ago.

The Right One.

FLORENCE SHAW KELLOGG.

How well I remember it—that bright June morning away in Southern Virginia, in the new home where we had set up our household gods—coming hither from the dear old hills of Chautauqua County, New York, in the hope of prolonging the life of the little mother who was so precious to us all. One of the

"Standing with reluctant feet
Where the brook and river meet,
Womanhood and girlhood sweet,"

and who made home so good and beautiful to us we would fain keep her with us as long as possible. Our hope, thank God! was realized; for breathing the balmy air, laden with the breath of the pine-trees, brought healing to her lungs and she tarried with us for many a long, glad year in the home where "with a world of strife shut out, a world of love shut in" she led us on and taught us ever of the deep things of life, the holiness of love and service—not by words so much as by example. From her, and the noble father as well, we learned the sweet, dear habit of living together in such a way as to draw out and strengthen the best in each of us. Oh, mother! mother! where amid the beautiful fields of Paradise is thy home to-day? Wherever it may be, we can only think of thee as still living and working in the old familiar ways, and we wonder have the angels yet taught thee the depth and sweetness of thy womanhood? Hast thou yet learned how beautiful thou art, how deeply potent for good thy gracious life and ministry ever was? She was so unconscious of it all here—that dear little mother of mine. There seemed no self in her thought of life, so fully, so freely did she give her all to others, all unconscious of the truth and beauty of her character or how like an angel she seemed to us in her sweet love and patience. As unconsciously as the violets give of their perfume, she gave herself, nor knew more than did they how deep and lasting, how holy, was the work she did for those around her. How often I have pictured to myself the scene as I think it must have been when she awoke in spirit life, and those to whom she had ministered here, and those whose lives were strengthened and sweetened by the touch of her life, and who had preceded her there, crowded around to give her welcome and to tell her of it all with glad thanks and praise. How her beautiful blue eyes must have opened in sweet surprise! How sacred and yet how timid must have been her joy! It would be so hard for her to believe it all. One of the world's nameless saints was she—yet knew it not.

LOVE THE GREAT FACTOR.

But I am wandering far from that beautiful morning and the thing I would tell you. It was when I was "Glad souls without reproach or blot, Who do God's will and know it not," and was wondering in my innocent heart how I would know when I had really crossed that mystical line and was a girl no longer. We were down

in the kitchen—Sister Alice and I—busy with some little task while the two faithful black women were doing the weekly washing near by. All unmindful of them, we were talking, as girls will ever talk, of life and love and all that the future might bring us, telling of our dreams, our hopes, and our ambitions. What brought it out I do not remember, but in response to something she said, I remarked very sincerely, as I then thought, with a girl's lack of wisdom and a girl's decision, "Well, I am never going to be married. I am going to stay always at home with father and mother." Hearing a low laugh from one of the women and realizing that she had heard what I said, I turned to her with "Don't you think so, Zilla? Don't you think I had better stay always with my father and mother?" And then it was that she said the words that have stayed always in my memory: "Yeasam, Miss Flora, I reckon you had, but if bime and by de right one comes erlong and you gets to lubbin him, and he gits to lubbin you, you better go." Did she know the wisdom of her words? Did she think how she had touched upon the very springs of life and love and happy marriage? Had she, like Mary of old, pondered these things in her heart and so come to know what it all meant, or was in only one more instance of those words of wisdom that flash as if by inspiration, from the life of the unthinking and simple? Who can tell? She was an ex-slave with the dark days of bondage but a few short years behind her, so few that she had scarcely yet realized what freedom meant, and yet, who could have answered me more wisely than she had done?

The right one! the heaven appointed mate whose coming was even then so near! He whose love-call was to lead me out of girlhood and set the seal of blessed womanhood upon my brow! Ah, yes! I would "go" with him, and surely, as Zilla said, it was "better so, though the old home and its inmates were never more dear and sacred to me than when I went from it with brave, but tearful "good byes" and low murmured words of blessing.

It is this waiting or not waiting for "de right one" that makes or mars a life time. In all the years since that summer morning, years in which my home has changed from Virginia back to New York, and from there to the beautiful, sun-kissed prairies of Kansas; years in which I question deep of life and love; years in which the twin angels, Pain and Patience, have had their way with me, and have taught me many things; in all these years I have never seen a mistreated, unhappy husband and wife that I have not recalled Zilla's words and have felt that they did not wait "till de right one come erlong."

MARRIAGE IS NOT A LOTTERY.

It is often said "marriage is a lottery" and this seems to be the thought of many an honest man and woman; but I deny it. I know if it seems so, it is because men and women have made it so; because they have not been determined enough to have it otherwise; have not been honest and "square" one with the other; and have rushed into what should be considered the "holly of holies" without due thought and preparation; without trying truly to know each other and to learn if they are suited to live together in love and joy, each being the other's good angel that shall help to strengthen all that is good and to uproot or overcome all that is not good in the other.

Marriage is so sacred, so holy, its responsibilities are so great and important, its privileges so beautiful and satisfying, how shall any one dare enter upon it without most earnest thought and conversation? The wedding day may be full of sunshine, but that is but the beginning. Though the sunshine of love should never be dimmed, the after life, that of which the wedding day is but the portal, must be serious and earnest, full of "ups and owns," of trials and vicissitudes, as well as of joy and pleasures, and husband and wife must needs be suited to each other in every way to keep glad step together down the long path of life.

Nothing is more beautiful than this union of two hearts and lives in one; this consecration of the two to the upbuilding of a home, the welcoming there of the little children in holy love and gladness, living before them strong

ROYAL BAKING POWDER,

Imparts that peculiar lightness, sweetness and flavor noticed in the finest cake, biscuit, rolls, crusts, etc., which expert pastry cooks declare is unobtainable by the use of any other leavening agent.

Made from Pure, Grape Cream of Tartar.

ROYAL BAKING POWDER CO., NEW YORK.

and true day by day, choosing always the better part, the growing acquaintance and knowledge each of the other that brings but deeper love and truer charity. Who shall dare call this a "lottery" or seek to cheapen and degrade its holy offices?

BLENDING OF TWO LIVES.

To the wife who cares for her husband and her home as she should, there is no work to be compared in beauty and sacredness to that which awaits her here. The husband must go out to heavier conflicts. He must meet and wrestle with the forces of evil everywhere; must face envy, greed, and malice, and win his way through valiant effort and persistency. He lays the foundations and builds up the walls of the home, but it is the wife who makes it good and beautiful, a fair haven to which he turns for rest and cheer, where his hands are strengthened for farther work and his heart made strong for the combat. What is so like to Heaven as a true home? It is Heaven—a fore gleam of that place "not built with hands," affording a glimpse of the rest and joy that remains after "life's fitful dream is over and time is merged in eternity."

The blending day by day, month by month, and year by year of man's strength and woman's tenderness, of man's reason and woman's intuition, of man's justice and woman's love, the deepening of the passionate love of youth into the calm, sweet love of later life, the ever-growing confidence and trust, the holding of one's life in abeyance to another in "honor preferring another," the giving of all that is best and sweetest; all that is deepest and holiest each in each to the home life, the blending of all that is best in the two lives in the lives of the children, the outward blossoming of love's holiness—what is so good—what so beautiful as this? All this because one has waited until "de right one came," until heart called unto heart, soul answered unto soul in joy and gladness, and thenceforward the two life-streams flowed on in one strong, ever-deepening current, on and on, ever on to meet the mighty ocean and become a part of its crystal tides.

TRUE MARRIAGE OROAINEO OF GOD.

It is only carelessness and unthinking, only the trying to appear what one is not, that makes of marriage a lottery and a disappointment, a house built upon the sands that must fall when the storms come and the winds of adversity beat upon it. But those who are true in thought and deed, those who would be known as they really are, who fear to dissemble and scorn to act a lie, those who stand in the clear sunlight without fear because in their hearts there is no guile, no deceit, where truth meets truth and respect, where love is wise as it is true, neither disowning nor concealing the faults we each must have so long as we are human beings, but strong to acknowledge and wise to help in overcoming them, those whose love is such as this, who can bear and forbear, are those whose "house is built upon a rock," and who do not fear, however the winds may rave or the storms may beat upon it. Such as these know marriage is something too deep to be expressed in words, a something ordained of God—eternal and true as He

The American Boy

MAGAZINE

The Biggest, Brightest, Best Boy's Magazine in the World

**"GOOD ALL THE WAY THROUGH"**

That's what the boys of America say of THE AMERICAN BOY. It develops the taste for good reading, and interests boys in all many sports, games, and exercises. Your boy will like

is so. They help to keep our faith in human nature unshaken and strong. Their homes are as oases in the desert where rest and refreshment are given to whosoever comes to them. They show us what is possible, and are object lessons that help us to solve the problems of social and domestic life. The homes of the people are the foundation of our National life, and only as they are strong and pure can the Nation be so. If there can be one true marriage, there can be many. If one true home can be built, more can be also. But we must learn to take deep thought of these things, and to teach our sons and daughters that they will not dare nor desire to do else than to wait till "the right one comes and he gets to lubbin you and you gets to lubbin him," before they go from the old homes to the new ones. Marriage must be regarded as a sacrament and the building of a home as the most earnest and beautiful work of life, rather than, as it now seems in so many cases, a little try at living together which, if it isn't all the heated fancy has painted, can be easily ended in the divorce courts. Oh, the wickedness, the pity of this thought! Is it not one great factor in thoughtless marriage? Is it not because of the quick and easy methods of getting a divorce that our people are so careless and unthinking? So it seems to me and I hail every agitation of this question with joy, believing that some day a Moses will be given us who is wise and strong enough to lead us out of this wilderness of wrong into the clear light of truth. May God speed his coming!

COMPATABILITY IN MARRIED LIFE.

I have spoken of love as a great factor in happy marriage, and so it is—not only great but indispensable, and yet, there must be something else also.

The mother may love a wayward child whose character she can not respect, because she is a mother and can never forget the babe she once held in her arms. She can never believe but that the time will come when her boy or her girl will turn from the evil doing and become again worthy of her love and trust; so she holds to him or her "through good and evil report" and will not let go. Under God, there is nothing that will help more in his redemption, than this clinging, trusting mother-love. He can not get away from it any more than he can get away from the love of God, or his childhood memories. It may be all that keeps alive his faith in the one bright star in his midnight sky. It draws and draws him with resistless force that is at once a pledge and a promise of final victory.

But the wife's love is different, though, as the years pass, it takes on more and more of the elements of this brooding mother-love and the old wife loves and forgives much as the mother does, but not the young wife. In the beginning, there must be respect on both sides and a perfect trust one in the other, a trust that knows no wavering or shadow of change; and each must have the qualities upon which this respect and trust may rest and feed, else is the happiness very short-lived and the two either live miserable, contentious lives in the home, or separating, furnish business for the divorce courts, all of which might be avoided had they but waited to really know each other and their needs and abilities.

Young people often mistake a passing fancy or passion for love and, not waiting to know, not taking thought of their own or the other's characteristics, not seeking to discover if the foundations be real, or if they have each that which will command a lasting love and respect, thinking more of the pleasant excitement of the wedding day, the pretty dresses, the presents, and all the ado made over a bride, than of the quiet days to come after all this is over. They rush into wedlock and often almost before the time allotted for the "honeymoon," they have found out their mistake and are sighing for freedom. Oh, the pity that this should be! Better a thousand times a lonely, single life than such an experience as this. Hail to the one who has the courage to walk alone and find her happiness, her work outside of marriage, rather than to satisfy herself with anything less than the best here. Hail and welcome to the "bachelor girl" and the bachelor boy or man, who keep themselves bright and sunny and are a joy and a blessing in many a home where the cares of life press heavily, and who are willing to wait for their soul's mate even until the "mortal has put on immortality" rather than take any other here! For them and for us all life will yet lift "its inner veil of glory" and we shall know that, whether married or single, we each have our part to do in making the whole grand and beautiful.

The Young Folks

The Two Graces.

BY JOHN C. BAIRD.

Two lovely maidens I chance to know,
Their names pray do not ask;
To con their many graces is
My pencil's only task.

A darkening midnight's stormy sky
One maleden's eyes reveal;
The other's rival with their hue,
The bluebells of the field.

Blonde tresses are the beauty's crown,
One wears them on her brow;
The other's wealth of raven locks
Are truest, critics vow.

O! prate not of the sculptor's art,
Fair forms to marble give.
Canst never rival those two maids,
Who breathe, and think, and live.

The music of celestial harps,
Their voices call to mind;
Once heard, their tones within your
Heart forever are enshrined.

To Youth and Age alike they give
Kind words without alloy,
A cup of water, free and pure,
A chalice brimmed with joy.

As on a lonely isle, they stand,
With leaping waves close by,
A sea of wrongs around them surge;
O'erhead, a leaden sky.

To call his own, let none aspire
Amongst this twain to choose;
The needy world would thus, alas,
A priceless jewel lose.

A dainty form, a gladsome heart;
Rich gifts of mind and soul,
The flowery paths of life they tread,
With Heaven for the goal.

An Intelligent Dog.

This dog, about which I am going to tell you, lives in Topeka at the National Hotel. He is a little over a year old and was bought from a little ragged boy who came into the office of the hotel for the purpose of selling him. He is a mixture of collie and spitz and is as beautiful as he is intelligent. He is of medium size and is covered with fine, white, fluffy hair and his fine, brown eyes bespeak his intelligence.

He is not what you would call a trained dog, but seems to observe and

This is Gaston.

(Courtesy of Daily Capital.)

takes up things of his own accord. He enjoys riding on the elevator and calls it by going to the shaft and giving a few short barks. He often calls it for his master and mistress. When riding on the elevator, he always stands erect on his hind feet. He is a great favorite in the hotel, but he knows his place and no matter how hungry he is, he knows dogs are not allowed in the dining-room. He is especially fond of the head waiter to whom he looks for his food when his master is not there, and when it is time for his meal, he stands just outside the dining-room door and gives his two or three little barks, as he does when he calls the elevator. He often gets his master's clothes and carries them to his bedside before he rises. He paid his own taxes the other day. He was taken to the office of the city clerk. The money was put into an envelope and given him, with directions to carry it to the man at the desk. He took the envelope in

LOWELL INGRAIN CARPETS

"The all wool kind"

We have been telling you for weeks WHY you ought to insist upon getting a LOWELL INGRAIN the all wool kind—when you buy a carpet. Thousands have taken our advice and are highly pleased.

ISN'T IT TIME FOR YOU TO CONSIDER BUYING

Remember these points: Cover the whole floor—it's warmer, and easier to take care of; can be used on both sides, a great saving. LOWELL INGRAINS are made that way; can be had in newest styles and colors, just like high grade carpets. If it is wound on a hollow stick, it's a genuine LOWELL INGRAIN.

When you buy carpets, ask the local dealer for
LOWELL INGRAINS. Look for the hollow stick
and run no risk. Don't accept any other.

Manufactured by BIGELOW CARPET CO.,

New York

leisure time he sits perched on his master's shoulder or hat, and offers friendly little suggestions to the man as he pegs away.

At other times Willie makes little exploring trips about the shop, and with the gravity and deliberation characteristic of his kind, inquires into things about which he does not understand.

"Here, come out and stop your growling," said McCrum to the bird the other day, on the occasion of the visit of a reporter to the place. Instantly the ruffled feathers smoothed themselves, and with as near a smile as a parrot can make Willie clambered off his perch and hopped to his master's knee.

"Ain't you ashamed to be so durn grouch'y to a stranger?" asked the man.

"Cold day, cold day," said Willie, with a little shake of his handsome feathers, and, as if anxious to change the subject, "Cold day; ha, ha! ten cents, please."

"What are you talkin' about, anyhow?" asked the man. "I b'lieve you're crazy. Now, take that old shoe and pull all those nails out, and hurry up with the work."

Without any further ceremony William took the shoe, and with many a grumble and unintelligible utterance proceeded to pull every nail out with his sharp bill.

"There now; that's something like," said the cobbler, "now you can go and get yourself a peanut or two," and without the slightest hesitation and a little screech of delight, the bird made for a box in the corner and fished out two peanuts, which he consumed with much gravity and apparent satisfaction.

"No," said the owner of the bird, "I am not rich, but there isn't money enough in Omaha to buy that bird. He is the only friend I've got—ain't you, Bill?"

"Ha, ha—pretty cold—ten cents, please," observed William.—Omaha News.

Be Manly.

Not long ago Mrs. Noble Prentis, who is so well known in the State of Kansas that one does not need to explain who she is, was talking to a company of boys. Those boys were lucky to be able to listen to a talk from such a woman and I wish the boys all over Kansas might know her and listen to her words, but as they can not, I am going to tell you some of the things she said, which is as good for one boy as another. She said:

"I always assume that every boy I talk to is a little gentleman. Always be polite and alive. When you walk lift your feet and hold up your chin. When you can do that you can do anything. No boy who slouches along and drags his feet can ever do anything manly."

"I don't believe there is a boy living who likes a sneak. I want to tell you about a boy I used to know out in Boulder, Colorado. You know I have been interested in boys for a good while. We had a boys' club out there and I became greatly interested in an Irish boy who was about the dirtiest, raggedest boy we had. But I liked him. He was a handsome boy and smart. We had little drills and marches and I one time caught Elgin stepping on the heels of the smaller boy ahead of him to make him jump and cry out.

"I thought some time what would be the best way to keep Elgin from imposing on the smaller boys. You see he wanted to pick a fight every chance he could get. I don't know what it is that makes some boys want to fight, but they do. Finally I went to Elgin and I said; 'I'm going to make you captain of this company. I want you to act like a captain and I want you to see that the bigger boys don't impose on the smaller ones. Will you do that? You should have seen Elgin straighten up. 'You bet I will,' he said and after that Elgin no longer slouched or dragged his feet and became clean and carefully dressed. You see I had appealed to his pride."

"We all do better if people believe in us. If somebody kept telling me I couldn't do a certain thing I'm afraid that after while I wouldn't try."

"Now there is another thing I want to talk to you about and that is cheerfulness. Be cheerful and you'll find you make yourself friends. Try getting up in the morning cheerful. Remember this, nobody ever made friends by being out of humor. And by being cheerful you not only keep yourself happy, but help others to be happy, too."

if we had lost our chief good, other people's good would yet remain, and that is worth trying for.—George Eliot.

Paint Without Oil

Remarkable Discovery that Cuts Down the Cost of Paint Seventy-Five Per Cent.

A Free Trial Package and a Big Book Telling All About Paints and Paint-Making are Mailed Free to Everybody Who Writes.

A. L. Rice, a prominent manufacturer of Adams N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powdrpaint. It comes to you a dry powder and all that is required is cold water to make a paint weatherproof, fireproof and as durable as oil paint. It adheres to any surface, wood, stone or brick, it spreads and looks like oil paint and yet only costs one-fourth as much. For many purposes it is much better than oil paint and is indispensable to every property owner.

Write to Mr. A. L. Rice, 392 North St., Adams, N. Y., and he will send you a free trial of his new discovery, together with color cards and his valuable book on Painting, all free. This book lets you into all the secrets of paint-making, exposes fake paints, tells you what kind of paint to use for different purposes and shows you how you can save and make a good many dollars. Write today and the book and free trial of Paint will be sent you by return mail.

The Little Ones

Mud Pies.

The Grown Ups are the queerest folks; they never seem to know that mud pies always have to be made just exactly so. You have to have a nice back yard, a sunny, pleasant day; And then you ask some boys and girls to come around and play.

You mix some mud up in a pail, and stir it with a stick; It mustn't be a bit too thin—and not a bit too thick. And then you make it into pies, and pat 'em with your hand, And bake 'em on a nice flat board, and my! but they are grand!

—Carolyn Wells, in St. Nicholas.

A "Truly" Story.

MRS. A. D. GRAY.

"It's been forever and forever muver, since you told me a truly story." My small son drew his chair so close up to mine that I could not move my arm, folded his hands in his lap, and waited.

He felt sure that this hint would be enough. "I wish your mother had two pennies for every 'truly' story she has told the small people in this family," I said.

"But I havn't been here but free years, and the rest have had a heap more time than me. Seems as if you owe me a lot of stories, muver," said Malcolm in an abused voice.

A bright fire blazed on the hearth, and the room was in soft shadow, but for the fire-light. "Firelight stories are the best kind," said Malcolm as he nestled close to my side, "Gwon!"

"Once upon a time a little girl lived on a big, big farm." "All by herself?" asked Malcolm, sitting up very straight.

"No, indeed. She had her sister, just a little older than herself, two jolly boy cousins about her own age, a grandfather, grandmother, and a mother—the finest one I ever knew—and cousins and aunts and uncles who came often to visit."

"Must have got pretty tired wif such lots of folks 'round tellin' her how to mind," said Malcolm with a shrug. "Gwon!"

"Well, at that place there was a fine Shepherd dog and the story is about him mostly. His name was Sam."

"At night when it was time to milk the cows, grandfather would say, 'Here. Same, come on. It's time to go for the cows.'

"Sam would stand right in front of him and not stir, only wag his tail very fast."

"'Go, get them!' grandfather would say."

"The dog always waited for this command, and then off he would dart, all by himself."

"The pasture was a long way from the house, but Sam never failed to bring home the cows. We children used to watch for him to come in sight. There were five or six in the herd, and

I once knew another very bright dog too. I loved him better than either of the others. Sometime perhaps I'll tell you about him, and about that big farm and those four truly children. Now it's my boy's bedtime."

"Seems like bedtimes and getting-up times bofe get here when you don't want them the worst," said Malcolm with a sigh.

THE INTERNATIONAL SUNDAY-SCHOOL LESSON.

(Copyright, 1906, by Davis W. Clark.)

Second Quarter, Lesson 1.

Matthew 7:15-29. April 1, 1906.

The Two Foundations.

The conclusion to the Sermon on the Mount is easily recognized as in all respects worthy of the most important composition in human language. It is a solemn, earnest, significant and convincing close. It gathers up, in practical form, the fundamental principles and their consequences, previously enunciated. . . . Creed expresses itself in conduct, faith in works. You can not get Escop grapes from acacia thistles. If conduct be right, creed must be right, and works justify the faith. . . . Knowing the will of God theoretically, and even teaching it to others is not sufficient. In the day of the test it will be all in vain for such persons to affirm that they have prophecied and cast out devils. The substance of religion does not consist in these things. Persons who have only such to their credit must certainly hear that fateful word, "Depart." It will not be the angry expression of personal enmity, but the enunciation of an irreversible decree, a penalty which inflicts itself. . . . The essential in

religion is doing the will of God. Nowhere is the antithesis of profession and life better expressed, "In vain ye call me Master if ye do not the things which I say." Doing Jesus' sayings is not the technical performance of specific acts. It is the being of a certain temper of mind and heart which will on occasion express itself in certain ways and deeds. Do, because one is. . . . It is by this means that the conditions of permanence are met. There is nothing fortuitous about it. No element of chance is here. Obedience to law is obedience to God, for law is the expression of the divine will. Whoever is thus allied to God has His omnipotence pledged for his success. . . . A sincere and persistent purpose in life finds the bed-rock of the divine will, and is not content with anything short of it. It accepts no substitute. Finding the bed-rock, it builds on it. . . . Strength, security, permanence are thus assured.

. . . In contrast to this is the careless, haphazard way of building the life structure, the supreme folly of which is apparent. Such act as if they could claim exemption from the operations of universal law. . . . How soon the primitive Christian life was put to the severest possible test. Not in some far-off, mythical judgment day, but in their own time came the testing. The Roman persecution beat and blew upon the church as an organization, and upon believers as individuals. The church stood because rock-founded. So did the individuals, who were similarly grounded.

III. Children's rights.
IV. The punishment of children.
I. Every true mother feels instinctively her responsibility to her children. She realizes that it is more than to see that they are comfortably housed, sufficiently fed, and properly clothed. She knows that her responsibility began even before they were born; and her interest never flags while life lasts. Most mothers realize, when it is too late, that their responsibility began when they were forming their own characters and later when they choose the fathers of their children.

II. Too much can not be said as to the moral training of children. Little faults left unnoticed grow into habits; and habits make the character. How soon a child, who has been laughed at for an exaggeration, learns to tell a falsehood! Carelessness of parents, in regard to honesty, often leads a child to become a thief. If a child is allowed to pick up things indiscriminately that do not belong to him, and appropriate them to his own self, it will not be long until he will learn to steal. It requires vigilance continually on the part of the mother if she would have her children from upright characters.

III. This subject of the rights of children is an important one. I have known

mothers to act as if they considered their children their property. They did not consult them in regard to their wishes, and they were not permitted to exercise their own judgment or show their preferences in regard to their belongings. I have known them to give away the children's own things—such as books that had been presented to them—without even consulting the children. Is that just and right? There are many phases of this subject that may be discussed in this paper.

IV. The best way of correcting a child should be discussed in this paper. A wise mother punishes her child not to gratify her anger, but to make him a better child; to teach him that the wrong he has committed must not be repeated; therefore, she will ponder and pray before she acts. The question of corporal punishment may be treated under this subject.

The West Side Study Club.

[I am glad to have the report of the West Side Study club and know of its work. It is not a new club but has not been on the club roll. It is most welcome.]

"The West Side Study Club," four miles west of Delphos, is in its fourth year. The officers for 1906 are: Mrs. Eames, president; Mrs. Emma Clark, vice-president; Mrs. Goodwin, secretary. Mrs. Baldwin, assistant secretary; Mrs. Truix, treasurer. We have a membership of ten, with an average attendance of seven and eight.

Our club motto is, "Whatever you do, do it well."

We meet every third Thursday of each month at 2:30 p. m. Our lessons are taken from the KANSAS FARMER, most always from the miscellaneous programs. Our last lesson was "Present-day Literature." Our next lesson will be "Mission Work in the World." We all like the programs as outlined in the KANSAS FARMER. The topics are assigned to different ones and then we have general discussions.

Last Thursday we met with our vice-president, who has just finished building a beautiful new house. Our husbands went with us, each member taking some part of the dinner. A very enjoyable day was spent.

MRS. GOODWIN.

Mothers and Children.

Mothers wear themselves out and do an injury to their children in not teaching them to help themselves and to be helpful to others. The amount of care that a child requires is very different from that which it may from indulgence demand. If the child were better for it, one would not grudge the time and weariness that the mother or nurse spends, but the child is defrauded in the exercise of those powers which can only develop by being put into use.

It is better for a child to go to sleep by itself than when it is rocked and sung to sleep; but as a general thing mothers prefer the bondage of the process of woolly sleep for their children, and so tie themselves up, and add to their burdens without in the least increasing the comfort of the child.

Mothers would spare themselves greatly if they would only learn that the training of the child begins with the earliest weeks, and that they can make the child understand many things that they would not believe possible.

When the mother is remonstrated with for spoiling the child by overindulgence, she will say, "My child is different from others; she is more nervous. If I do not take her up she will cry and make herself sick."

The child in the beginning, finding that the mother ran to it the minute that it began to cry, of course soon learned this method of summoning her. It also perceived that the louder the cry the greater the indulgence, consequently it develops speedily into a despot, beneath whose tyranny the mother grows wan and pale.

When it is said of her, "She is a perfect slave to her children," she looks satisfied and pleased, as if she had won a martyr's crown, instead of which she has uselessly squandered her strength, and prevented the child from learning proper habits which are as necessary to his growth and development as it is that he should learn to walk instead of creeping the rest of his life, because he may fall and hurt himself, and cry now and then.—Dr. Grace Peckham Murray, in Harper's Bazar.

Here is a dictum right after the heart of the Audubon Society. A scientist says that if the earth were birdless, man could not inhabit it for longer than nine years. All the sprays and poisons in the world would not keep down the insects, which would eat up everything. This fable teaches much regarding men's hats.

TALK ABOUT YOUR HAM

You never tasted meat so sweet and well kept as ham smoked in the new way with Wright's Condensed Smoke. If you have ham, bacon or any kind of meat to cure

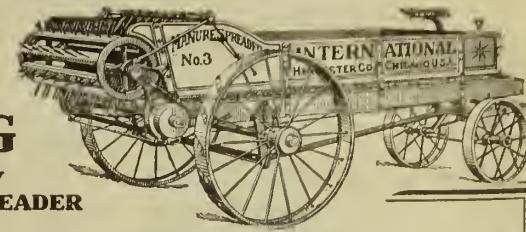

WRIGHT'S CONDENSED SMOKE

will cure it perfectly without loss of time or meat. Easy, certain, safe, healthful. Bottle smokes 280 lbs. At druggists 75 cents. Fully guaranteed. Write for "The New Way." Tells ALL about it.

The E. H. Wright Co., Ltd., 112 W. 4th St., Kansas City, Missouri

THINGS WORTH KNOWING

If you are going to buy
A MANURE SPREADER

No machine within his reach is capable of doing so much for the farmer as the modern manure spreader.

But then it must be a machine with features—features of economy and efficiency.

The I. H. C. Manure Spreader has such features.

Any man of experience knows that a spreader only works perfectly when the load is level.

The I. H. C. Spreader is the only spreader with a vibrating rake in front of the beater or cylinder which levels every load and any load of manure.

Any man knows that the apron operates better when power is applied at both sides.

The I. H. C. spreader apron is driven at both sides from both hind wheels.

This saves all torsion, binding, friction and undue strain, and consequently saves breakages and results in lighter draft.

One lever is better than many levers in operating any machine.

The I. H. C. spreader is the only spreader which is controlled and operated entirely with one lever.

It has ten different feeds—can be adjusted

instantly while in motion to spread three to thirty loads per acre.

Large, solid, steel axles front and rear—front wheels cut under—turns very short.

Steel wheels—no rotting or drying out. Broad faced tires with turned in flange to keep out dirt, mud, etc. Lightest and strongest.

Provided with traction lugs on rear wheels—will work perfectly on hard, frozen or wet ground.

Made in various sizes to suit all requirements.

The I. H. C. spreader will distribute perfectly manure of all kinds—wet, dry, mixed, strawy, full of stalks, frozen, caked, etc.

It may be equipped with special features known as lime and drill attachments for distributing broadcast, or in drills, fine manure, commercial fertilizers, lime, ashes, salt, cotton seed hulls, land plasters, etc.

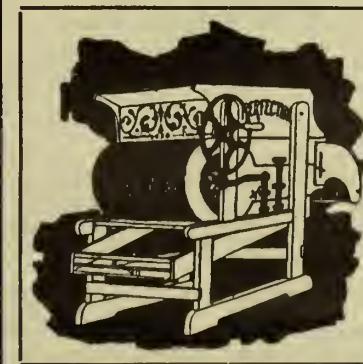

Remember what we have told you—it is the manure spreader with special features which all make for success.

Go to the International Local Agent and look it over, get and read the catalogues or write for further information. It will pay.

International Harvester Company of America,
(Incorporated)
Chicago, Illinois, U. S. A.

Do You Know?

That one handful of noxious weed seed to a bushel of your grain, if planted, will absolutely ruin the crop. There are many cleaners that will remove all but that last handful of the weed seed from your grain, but the "Perfection" is the machine that does the work the way it should be done. Better own the machine that is easy to operate, easy to understand, and yet does its work so perfect that your crops are increased 25 per cent to 50 per cent. :: :

A "Perfection" cleans, separates and grades anything from Corn to Red-Top.

Write us today and we will tell you what it will do as well as show you how it does it. Be sure and tell us the kind of grain you raise.

The Grange in Anderson County.

Editor Grange Department:—I am pleased to announce to the Grange Department of the Kansas Farmer that the grange in Anderson County is in a prosperous condition.

On Saturday, March 10, I organized a new grange at Welda, in this county, with a good membership. E. M. Bentley, of Welda, was chosen master and Mrs. J. M. Richardson, of Welda, secretary. This grange is named Welda and has been numbered by the Secretary of the National Grange, 1446. I have reason to think that it will prove a strong factor in our order.

The grange that I belong to, Equity, No. 1411, at Lone Elm, Anderson County, is doing finely this winter. We have a large attendance at our meetings and all seem to be interested and are lending a helping hand to make each meeting interesting and profitable.

At our next meeting we will receive by initiation twenty new members whom we have reason to think are not after loaves and fishes, but for the purpose of making of themselves better men and women and assisting their neighbors in doing the same.

I am informed that Diamond Grange, No. 5, located at Haskell, this county, is building a new grange hall and is increasing in membership. We feel proud of our order in Anderson County. Let us hear from other grange counties in Kansas through the Kansas Farmer.

J. H. SMITH,

Deputy for Anderson County.

Manhattan Grange No. 748.

Editor Grange Department:—I send you another paper for publication read before our grange at a previous meeting, on the subject, "How May We Enhance the Comforts and Attractions of Our Homes and Strengthen Our Attachment to Our Pursuits."

At our last meeting we received nine new members and reinstated two, which makes an addition of eleven to our membership.

At our next meeting we are anticipating a very pleasant and profitable session. Professor TenEyck, of the Agricultural College, is expected to be present and deliver an address. There are others billed for this occasion whose names I am not able to furnish at present.

All our members express themselves as highly pleased to see the grange page in the Kansas Farmer filling up with various items of interest to patrons.

Let us hear from every grange in Kansas.

A. MUNGER.

Spring Hill Grange No. 279.

Spring Hill Grange held its first farmers' institute recently. It was a success and resulted in a permanent organization. Professor Miller, from the Kansas State Agricultural College, delivered an address in the afternoon on "Seed-Corn." At the evening session a literary program was combined with the lectures.

Our grange is in a flourishing condition and the last meeting proved to be very interesting. Several members of Glendale Grange, No. 1433, in Miami County, were received on merit, as this grange had surrendered its charter, many of its members having sold out and moved away.

At this meetings the topics of "Good Roads" and the "Use of Incubators" were thoroughly discussed. Several of our farmers are dragging their roads, and

some are experimenting with natural gas as a heat-producer for their incubators.

Our grange has also organized a fair association. It has leased six acres of land for five years and is arranging to hold a three-days fair each year. This action is the outgrowth of a very successful one-day fair, held in Spring Hill last fall under the auspices of Spring Hill Grange.

"Should the farmers lease their land to gas and oil companies?" will be the topic for discussion by the younger members at the next grange meeting.

STREETER BLAIR.

"How May We Enhance the Comforts and Attractions of Our Homes and Strengthen Our Attachment to Our Pursuits?"

A. MUNGER, BEFORE MANHATTAN GRANGE,
NO. 748.

Comforts and attractions are comparative and largely matters of taste. This is an age of comfort as compared with past times. This is a country of comforts as compared with many other countries of to-day, yet like Oliver Twist, we pass our plates and ask for more. This is the disposition that brings improvement; this has made us what we are. How shall we direct the force that the good work may continue?

First I would say, keep thinking. Try to realize fully what we want or need. Do not act on the first impulse. Study well a plan of life and give it consistent outlines. Have a high ideal and work towards its attainment. Leave out vices great and small, expensive or inexpensive. When we see a chance to mend our methods, stop a waste, or add some needed improvement, be quick to act.

Surround home with what each considers most desirable. What these shall be it is needless to enumerate, for what is indispensable to one may be useless to another.

All can appreciate a house supplied with modern conveniences, with books upon the shelves and pictures on the wall, filled with a family whose principles and morals are worthy of imitation. A farm, neat and well-kept, whether it be an acre or a township; farm buildings orderly and well planned, suited to their intended uses—with this for a foundation, well-directed work will bring the rest.

Here I might stop—but a few details—set out fruit, plant good seed, do good farming or housekeeping, as the case may be. Take good care of stock. These all help to strengthen our attachment. We all like a nice horse better than a poor one—a nice farm better than an ill-kept one.

TAKE PART IN PUBLIC AFFAIRS.

Take a part in matters of public welfare such as good schools, good roads, good public officers and their work. Plant a garden and do not let the weeds take it. The garden is a good place to combine forces and all take part in raising as well as using what will grow there. A few dollars' worth of suitable seed, well planted and tended, will make it the most profitable spot on the farm.

Do not loaf in town or at the neighbors' while your wife slops the hogs or chops the stove wood. Of course you are solicitous for her welfare and know that fresh air and physical culture are just the thing, but do not neglect your own health just to give her a chance.

DON'T USE TOBACCO.

Did any one ever estimate the amount of health, money, and personal cleanliness that is sacrificed by the people of this country that they might use tobacco? If these were all taken into serious consideration by people generally, tobacco factories would have to shut down. What an amount of real, solid comforts might come at less cost than tobacco!

HAVE A HOBBY.

In your business, have a hobby or be a specialist. Do not neglect everything else but let some one thing predominate.

The premium is on the person who can do one thing well. Modern machinery has changed the world's ways. We can not afford to do without machinery, yet it is expensive. Therefore, decide on what you are going to do; get the needed machinery to do it with; then do all you can with that machinery. Do not get a dozen kinds and only use each a little. That is the rock which has cost many a wreck on this beautiful, billowy prairie-land where sailing is so easy and wrecks so disheartening. I have seen more than a car load of half-worn machinery, representing thousands of hard-earned dollars, neglected and

I CURED MY RUPTURE

I Will Show You How To Cure Yours
FREE.

I was helpless and bed-ridden for years from a double rupture. No truss could hold. Doctors said I would die if not operated on. I fooled them all and cured myself by a simple discovery. I will send the cure free by mail if you write for it. It cured me and has since cured thousands. It will cure you. Write to-day. Capt. W. A. Collings, Box 109 Watertown, N. Y.

doing well enough when we might do better." This applies to habits of life as well as to meadow land. Cultivate better the acres we have instead of trying to buy all that joins us. When we can double the crops on what we have is a good time to buy the balance.

HE DIDN'T SELL THE FARM.

A young man once set out an orchard to make the farm sell, as it did not pay and he was going to quit. In a few years and before he found a buyer, the orchard began bearing and made such a nice farm and paying investment, that it was withdrawn from the market and he remained there to old age.

SEE, HEAR AND KNOW.

Do not be too sure we know the best way—that closes the door to improvement. Go from home and go with your eyes open. See how the other people live. There is inspiration in seeing, hearing, and knowing how others do things. Make their best ideas your own and make use of them at home. Eliminate the other sort from your place and yourself.

THE MODERN WAY.

But "how may we strengthen our attachment to our pursuit," is well to ask but who shall answer? Modern machinery with horses, steam and gasoline to furnish motive power, now does most of the work on the farm while we ride along on a spring-seat to see it done; but with this immunity from the most wearing part of farmwork, the old man is going to town and the boys are learning trades or professions until the demand is still for wider implements that fewer hands may sweep over more acres as the procession of humanity moves toward the cities. The census shows that in many places there is an increase of population, but an actual loss of numbers on the farms. It is the old story of the goose that laid the golden egg. When she has brought her owner more than the first early dreams dared picture, her cackle becomes so annoying that her head must come off, and too often like the old woman of the legend, when the goose is killed, enjoyment vanishes.

PITY THE RETIRED FARMER.

The life of a retired farmer on a town lot is not always unalloyed bliss, and the starting of a young man in a city is not without its vicissitudes. Sometimes "tis better to endure the ills we have, than fly to others that we know not of." One way to strengthen then our attachments to our pursuits would be to take a retrospective view and see how our fathers and grandfathers chopped the forests, plowed among stumps, split rails for fence—while we now unroll barbed wire by the mile—cut wheat with a cradle or a sickle, raked and bound it by hand, thrashed it with a flail, and took the crop to mill in a sack before them on a horse. And see how our mothers and grandmothers pulled the flax, spread it out to "rot," broke it, hackled it, spun and wove it, all by hand, and then sewed it into the various articles of household use, also by hand. Compare these methods with those in common use to-day. What a change! But if we try to prove that all this has strengthened attachment to our pursuits, we must confess defeat—the child with a hundred toys wants a thousand more, while he with only one, dares wish for just one more. Children's toys are their tools; grown people's tools are their toys; and the one is about as easily satisfied as the other.

EFFECTS OF AMBITION.

Another influence, difficult to reach, which affects comforts of homes and homes themselves is in our rush and exultation at the thought of what a fine country we live in and how much of the world we can absorb. Are we forgetting that those who toiled a month to accomplish what we want to do in a day, were laying the foundations for this Government? Do we realize that with the same lightning speed with which we want to do everything else, we can run this country to ruin instead of to glory? Do we need the earth? The "Circles in the water" spread until they come to naught."

How many times have the widening circles of empire weakened the strength of the center? And what of those in public office? Is the welfare of the people considered when a man is put in office? Or is it because he is a safe tool to defeat just legislation and make a farce of existing laws?

THE KIND OF LIFE TO LIVE.

Rational, wholesome self-denial, honesty in public and in private life would preserve to posterity some of the comforts we already enjoy. If the machinery of government is clogged with bribes, boddle, and corruption, our descendants will some day experience the hardships of past generations. Unblushing avarice needs to be replaced by right and justice.

High and low, rich and poor alike, need to know that every law of this land applies to them, just as it applies to every other person, and that it will be enforced with equal justice and certainty.

Internal-Trade Movements for February.

Internal-trade movements for February and a two-month period show, in the aggregate marked gains over corresponding activities in either of the two immediately preceding years, according to reports received by the Department of Commerce and Labor, through its Bureau of Statistics.

GRAIN.

Total receipts of grain at 15 interior primary markets during February amounted to 57,659,238 bushels, compared with 45,411,546 for February, 1905, and 56,943,264 for February, 1904. Of the movement for the second month of the current year, 13,956,108 bushels were wheat, 21,826,530 corn, 14,759,192 oats, 6,412,925 barley, and 704,483 rye. During the first two months of 1906 grain receipts at these cities aggregated 129,761,974 bushels, more than 28 million in excess of the corresponding movement of 1905, and over 8 million greater than that of 1904. Of this total 37,138,878 bushels were received at Chicago, 3,944,587 at Cincinnati, 1,918,316 at Cleveland, 2,688,500 at Detroit, 6,029,829 at Duluth, 1,637,375 at Indianapolis, 10,381,500 at Kansas City, 1,188,000 at Little Rock, 3,770,162 at Louisville, 8,434,260 at Milwaukee, 23,540,300 at Minneapolis, 7,915,700 at Omaha, 5,309,300 at Peoria, 13,556,058 at St. Louis, and 2,309,200 at Toledo. Shipments of grain from these 15 markets during the month of February amounted to 40,550,980 bushels in 1906, 26,645,988 in 1905, and 33,565,297 in 1904. Similar shipments for a two-month period were 88,061,080, 63,041,850, and 69,192,509 bushels, respectively. Of the 1906 total, wheat constituted 12,452,748 bushels; corn, 31,503,782; oats, 35,302,226; barley, 7,469,689, and rye, 1,332,535.

LIVE STOCK.

Aggregate receipts of live stock at the markets of Chicago, Kansas City, Omaha, St. Louis, St. Joseph, and St. Paul during February amounted to 3,101,454 head, against 2,832,848 in February, 1905, and 3,215,998 in February, 1904. During the first two months of the current year similar receipts totaled 6,753,708 head, 432,044 more than during the corresponding period in 1905, and 260,640 in excess of the same months in 1904, and consisted of 1,384,692 cattle, 68,837 calves, 3,566,931 hogs, 1,624,118 sheep, and 109,130 horses and mules. Of the total of all classes, 2,956,860 head were received at Chicago, 1,233,409 at Kansas City, 883,465 at Omaha, 768,222 at St. Louis, 615,164 at St. Joseph, and 296,588 at St. Paul. Compared with the corresponding receipts in 1905, gains were made at all of the markets specified with the exception of St. Paul, where a slight loss occurred.

At Chicago the receipts of packing-house products during February amounted to 68,176,684 pounds in 1906, 59,007,372 in 1905, and 46,274,668 in 1904, while shipments for the same months were 212,267,872, 191,122,270, and 214,898,447 pounds, respectively. Receipts during January and February combined were 142,458,663 pounds, compared with 103,958,671 during the corresponding period in 1905, and 98,629,868 in 1904. Shipments which aggregated 463,255,657 pounds during January and February were 86,886,641 pounds in excess of those for the same months of 1905, and 21,660,287 pounds greater than for 1904.

WHEAT.

Receipts of wheat at the spring-wheat markets of Minneapolis, Milwaukee, Duluth, and Chicago from August 1, 1905, to February 28, 1906, amounted

to 127,929,531 bushels, compared with 114,087,406 received during the corresponding months in 1904-5 and 118,250,-850 in 1903-4. Of the present season's movement, 71,801,540 bushels were received at Minneapolis; 5,788,630, at Milwaukee; 32,255,420 at Duluth, and 18,083,941, at Chicago. At the winter-wheat markets of Toledo, St. Louis, Detroit, and Kansas City wheat receipts from July 1, 1905, to February 28, 1906, aggregated 58,041,695 bushels, 8,491,302 greater than the corresponding movement in 1904-5, but 5,961,107 below that for 1903-4. Toledo received 4,410,200 bushels, St. Louis, 18,210,000; Detroit, 1,844,695, and Kansas City, 33,576,800.

The run of petroleum from wells in pipe-line territory during February amounted to 2,761,068.49 barrels and other receipts to 3,088,152.66, while regular deliveries were 3,535,472.77 barrels and other deliveries 2,909,226.56. During February, 1905, similar movements were, runs from wells, 3,280,742.86 barrels; other receipts, 2,698,275.09; regular deliveries, 3,635,613.03, and other deliveries, 2,689,895.46. For the two-month period runs from wells aggregated 5,923,066.90 barrels in 1906, and 7,023,743.99 in 1905; other receipts, 6,957,349.49 in 1906 and 5,764,270.34 in 1905; regular deliveries, 7,387,289.31 in 1906 and 7,663,556.74 in 1905, and other deliveries, 6,388,182.43 in 1906 and 5,670,414.72 in 1905.

The car supply during February was much more satisfactory than for a number of months previous. Very few complaints were received from Middle and Northwestern States, and in these localities the situation was generally indicated as improving rapidly. In the coal regions there was a sharp demand for cars, often in excess of the supply, but in this connection it should be remembered that the recent coal movements have been decidedly abnormal, owing to the threatened labor difficulties. From the South some serious complaints have been received, the scarcity of cars at Charleston, S. C., being reported as worse than ever before, and affecting all classes of freight. Numerous complaints were also received with reference to delays on freight forwarded. At Louisville a pronounced shortage in the supply of cars was reported, affecting all classes of business to a greater or less extent.

The Good Roads Train.

EDITOR KANSAS FARMER:—There is an article in your issue of March 8 upon which I would like to comment. It is

Good Roads

ADD TO YOUR PROPERTY'S VALUE

God roads bring your farm nearer town. Accessibility in all kinds of weather has a financial value. Farmers and merchants are equally interested in improved means of communication.

D. Ward King AND OTHER EXPERT ROAD BUILDERS

WILL BE AT

and tell about the workings of the Split Log Drag.

Free Lecture and Practical Demonstration

Your presence is wanted—not your money. There's nothing to sell; nor will a contribution be asked. Absolutely free. All expenses paid by the Santa Fe, which is conducting this good-roads campaign.

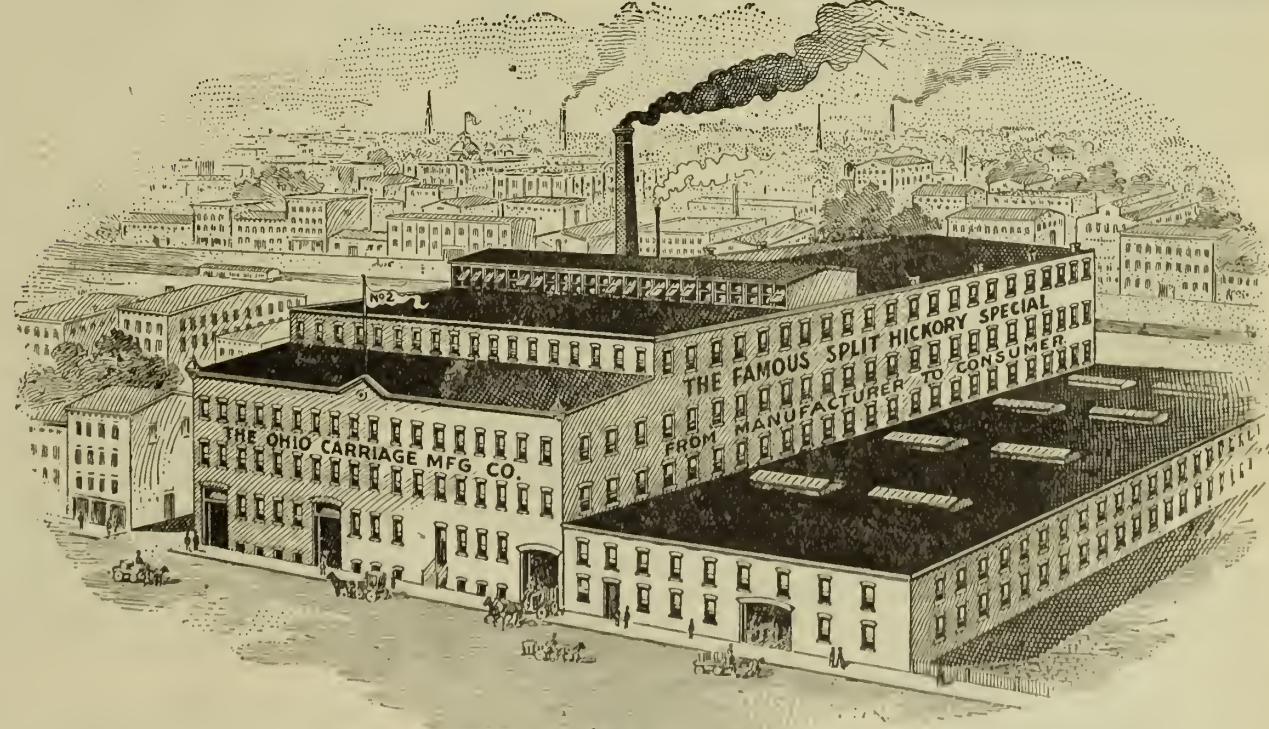

the country for some time, and some of it is very ill advised. J. M. ENGLE.

Dickinson County.

[The principal speaker on the good-roads train will be the inventor of the King road drag, an inexpensive implement by the use of which dirt roads are kept from becoming bad. The Santa Fe is to be commended for bringing before the people of the territory it traverses, practicable methods of maintaining good roads cheaply.—EDITOR.]

It is a good thing for the farmer to always aim to do the best work and to have the best in everything instead of aiming to do the most and have the least and that of poor quality, as is often the case.

The Chinese use envelopes with red lines on them and a heavy red band down the center. A traveler who has been in China investigated the reason for this. It is simple. Chinese mourning being white, it is regarded as an unlucky color for an envelope. Red is a lucky color. Hence the red bars and lines.

A Special Factory for a Special Buggy.

Did you ever see an IDEA grow into an immense FACTORY?

Well, here's a picture of the factory—and the story of how it grew from one man's idea.

This new factory was built and equipped by The Ohio Carriage Mfg. Co., of Cincinnati, and it is devoted exclusively to the manufacture of their famous Split Hickory Special Top Buggy.

It is the only carriage factory in the world making one distinctive and exclusive style of buggy.

Some others claim to be manufacturers by showing pictures of a big factory, but forget to state just where their factory is located principally because it doesn't exist. Our factories are located right here in Cincinnati at 1902 to 2000 Plum St., and 247 to 253 Stark St., and are open to inspection by you or your friends at all times. It's the only one in Cincinnati ad one of only two in the State of Ohio selling their product direct to the consumer.

This is a new plan—this building of one special factory for one special buggy.

The Company started out to make the Split Hickory Special their leader, the best buggy in the world and they have succeeded in placing it far in the lead of all other buggies.

The factory has 75,000 square feet of floor space. Think of it—seventy-five thousand square feet of factory space given over exclusively to the making of one kind of vehicle!

Before this new factory was built, the Company devoted a part of their general factory to the manufacture of the Split Hickory Special, and were able to make a better buggy than any one else at the price.

But now, with an enormous special factory, having acres of floor space, and more skilled carriage builders than ever before, they are bound to surpass their former record.

On the new plan, the Ohio Carriage Mfg. Co. manufacture at a minimum of cost, using the finest grade of material. It is possible to get, and the highest

skilled workmanship. Every man is an expert on making this one special buggy. Every piece of machinery in the factory is made for this particular work. Every piece of material is purchased for this especial make and style of buggy.

With these trained men—with this special material—and with these special facilities, the Ohio Carriage Manufacturing Co., in this Special Split Hickory Buggy at \$50, turn out a vehicle that would cost \$75 anywhere else. They sell the \$50 Split Hickory Special on their 30 Days Free Trial Plan and guarantee every vehicle for two years from the time it leaves the factory.

In spite of the general advance in cost of all raw materials, and the higher prices paid their skilled workmen, they don't charge a cent more for the "Special" this year than they did last.

Our readers can get a copy of the company's handsome 1906 catalogue by sending a postal to H. C. Phelps, president of the Ohio Carriage Mfg. Co. His address is Station 251, Cincinnati, O.

NATIONAL PLANT CO., Somerville, Mass.

Horticulture

The Home Orchard.

GEORGE WEST MAFFET LAWRENCE, BEFORE THE FARMER'S INSTITUTE, FRIDAY, FEBRUARY, 16.

The fruit-grower makes a severe distinction between planting for commercial purposes and for home use. We must have quantity even at the sacrifice of quality if we become a factor in the market; we must pay strict attention to the ability of the fruit to stand handling, packing, and shipping, and to the holding-up and long-keeping qualities. With home consumption none of these things need be considered, and choice quality and a succession throughout the season are the most important considerations. I shall confine myself to my own experience right here in the suburbs of Lawrence, with a black, waxy soil, with a blue-clay subsoil of a depth varying from 16 to 30 inches; land that should be tile-drained but is not; land where the natural roadside grass is Kentucky blue-grass and where white clover springs spontaneously and is an abomination; a locality where the encroachment of forest-trees is only kept down with the axe and the grubbing hoe; where thousands of elm and maple seedlings root by the roadsides—and all this in Kansas! Let not the Western Kansas farmer whose soil and climate conditions are so vastly different, be deceived by my fruit recommendations as to varieties.

I am talking for the benefit of the farmer who, from the lack of time to care for it, does not plant fruit; who thinks he can buy fruit for his family cheaper than he can raise it, and whose family does without it because the inconvenient dollar is not in reach at the convenient time. I wish to get under the hide of the man who can not afford to indulge his family with fruit, but must face a heavy doctor's bill every year or two because of a not sufficiently varied diet in his family. I desire to reach the ear of the father who knows nothing of the medicinal effect of the various fruits and vegetables. I hope to attract the attention of the parent whose son craves something he knows not what, but has started to tamper with strong drink. I speak for the family of unthrifty children, always unhappy and dissatisfied at home, and longing for a change of scene.

What can add more to the attractiveness of a farm-home than a plentiful and varied fruit supply? What will always bring back to your children pleasurable memories of that home in all their after life? What will better attract boy chums and girl friends and popularize the home more than the charm of gathering direct from the trees, plants, and vines, the luscious, well-ripened fruit, theirs for the asking through an unfailing cordiality?

Can you raise \$50 to spend this spring for choice fruit? If not, can you squeeze \$25? If so, go at once to your home nurserymen and give your order. Explain that you want your order true to name and can not allow substitutions. That which is missing, let your nurserymen order abroad. If you can afford it, let them add varieties, but do not let them strike anything from the following lists. Order two trees of each kind, so if one fails the other will still be left.

ECONOMY IN SPACE.

Where will you find room? The apple-trees must have plenty of room, 30 feet apart. The plums will do best in the dooryard or in the chicken-yard where the earth is tramped. Several peach-trees can be put along the kitchen walk and one or two in the shelter south of protecting buildings—these latter will bear in "peaches-are-killed" years. The cherries can go along the fence-row or beside the front walk or down the driveway. A pear-tree will do well close to and north of the house, other pears will take but little room scattered here and there. The grapes can go upon an arbor over the kitchen walk or be fastened against the sunny side of a building; a few bushes of currants and gooseberries will do well on the north (shady) side of a tight board fence. The strawberries, raspberries, and blackberries should be in the kitchen-garden behind chicken-wire fencing. Kindly remember that a horse will go a mile to bark a peach-tree and he is very fond of plum foliage; a cow can thrash to ribbons a small tree or bush with her horns and a 400-pound hog can bear down and snap off a tree trunk three inches through, or work over and gnaw all the surface.

roots of any large fruit-tree. This has cost me quite a number of dollars to learn.

VARIETIES OF APPLES.

And now for the varieties from actual experience at "Elkhorn Fruiter." Of the apples, the earliest of all for eating and apple-sauce is the Red Astrachan. Next follows the Strawberry-apple, a handsomely striped sheep-nose of choice quality, each perfect specimen a poem in itself, and lasting through a long season because of the habit of the tree to ripen only a few specimens at a time, and further it bears each and every year. Then comes the Maiden's Blush, a flat, yellow apple with red cheek, a superior cooking-apple, but easily blemished with insects; and at the same times comes the little, round Red June. Next in importance is the Pennsylvania Red-streak, a very large apple of highest dessert quality, that ripens a few at a time and keeps well in the cellar until Christmas. It has borne eleven crops in twelve years with us. Where room will allow on a town lot, the two varieties, Strawberry-apple and Pennsylvania Red-streak, will furnish a succession from early to late and they can take the place of shade-trees. Next in the list we place Summer Rambo and if space will permit a very superior white apple is Cooper's Early White. The Dominie is a fine eating- and cooking-apple, but it has the fault of rotting on the tree and shedding too freely. When we come to late fall and winter apples, the Winesap outranks them all for quality; the Genton (Jeniton) keeps longest of them all its crisp sprightliness of flesh, although it runs small because of overbearing and will crack badly if heavy, late rains ensue, and it suffers some from a blistery rot; the Jonathan is a superior dessert apple that brings the highest price—its weak point is that it sheds to the ground prematurely and will have to be picked before the rest; the Missouri Pippin is early to come into bearing, it is small and a long keeper; the Ben Davis outranks the entire lot as a pie apple; it is choice for use in jelly, applesauce and "liquid apple-jelly" (a product halfway between maple-syrup and strained honey). By all means add the Rome Beauty to the list. Two apples not on my list but should be on yours, are the Grimes' Golden and York Imperial. We are all going to plant this year a mammoth apple that is attracting attention—the Wolf River.

HOW TO PICK.

And now that we have the apples, we must have a picking-stick with which to reach to the top of the highest trees and take the perfectly ripened specimens as they mature. Have two poles for handles, one twelve feet and the other sixteen; take an oaken block one inch thick and 3½ square; bore a three-quarter hole in the center to fit the handles; then a series of holes to fit number-nine wire, in as large a circle as the block will allow; take pieces of wire about ten inches long and force each end up through the holes in block and staple to place. When completed the picker should resemble the human hand with all the fingers held touching at points. The wires should be pulled apart or pressed together to suit the size of the fruit it is about to be slipped over.

PEACHES.

Now as to peaches, remember you can not expect over four crops in ten years, but you will get some peaches the second year from planting. My list would be Early Rivers, Early Crawford, Alberta, Stump the World, Crosby, and Crawford Late. Ask the nurseryman to add two or three more in the succession and add a couple of large clingings.

PEARS.

After a desperate and losing fight with pear blight, I have fallen back to the Bartlett, which is the finest of them all in quality, and after being cut to pieces in cutting out the blight will put out again and last a long time before succumbing finally; try also the Duchess and the Keiffer. The Anjou is a very fine pear. Set these in the sod on the lawn and in the best drained place you can find.

So long as we had the Wild Goose and Minor plums on the place we had a yearly supply; try these two and ask the nurseryman to recommend several Japan plums.

CHERRIES—SMALL FRUITS.

On the cherry list are the successful three: Early Richmond, English Morello and Montmorency. The cherry is a short-lived tree and will soon play out if any large limbs are injured or broken. As they give way, be sure to make the loss good by planting others.

Try a chapter of mulberry-trees and

Somerville Nursery, SOMERVILLE, MASS.

SEED CORN

There are many points to be considered in selecting seed corn; some of the most important are outlined in the above cuts; namely, well filled out at butt end with small to medium sized shank; the tip of ear well capped or covered over with full sized grains; the kernels should be wedge shaped from cap to where it rounds off at point or germ end and the rows should be close together but still not so tight as to smother the germ and cause mould. The grain must be dry and set on a small cob which is such texture that it will dry out easily and quickly. These points are all brought to perfection in the new

The Best Fruit Paper

In The Fruit-Grower, published monthly at St. Joseph, Mo. The regular subscription price is a dollar a year but if you will write for free sample copy and mention this paper, you will receive a proposition whereby you may secure it one year WITHOUT COST. Everyone who has a few fruit trees or a garden, should read

Fruit-Grower Co. 169 S. 7th, St. Joseph, Mo.

When writing advertisers, please mention this paper.

a row of dwarf Juneberries, the latter a cultivated huckleberry that always gives a reward. They make a fine bush for the chickens to loaf under.

For grapes, the four standbys are Moore's Early, Worden, Concord and the White Niagara.

If the blossoms have not been removed from the strawberry plants you set this spring, you can get some berries this May from them without serious injury to an extra-early set plant. Try four varieties—the Warfield and the Senator Dunlap for main crop; then the Parker Earle which will give you much pleasure because of the great mass of fruit it staggers up under and lifts free from the ground; then the Clyde, which ripens its fruit lying on the ground, for all the world like a nest of bright-red quail's eggs. Then there is the Parson's Beauty that is showing marked superiority in the hands of our local growers.

The Kansas and the Cumberland will give you all the black raspberries you will need; the Cardinal is a purple cap of great vigor; and for red raspberries the Miller and the Loudoun will complete the list. Remember you will have to severely keep the red raspberries confined to a narrow row if you expect much fruit, as they spring up so from the roots to weaken themselves and prevent fruiting.

I have been patiently waiting for years to get a start of blackberries from our mutual friend, D. G. Watt, who is perfecting a variety of marked superiority which has not yet been introduced. The Kenoyer is a new variety of much merit. The Lucretia Dewberry is much larger than most blackberries and is a running vine with a plenty of awful thorns.

FOR ADORNMENT.

Have you a daughter nearing womanhood? By all means send away and get her some of the rose collections that can be had for from ten to twelve cents per plant from the rose specialists. Two or three dollars will make a great showing and she can revel in roses until snow flies and besides she can propagate plants for the whole township. Besides the hardy roses of every color and shade, there are the monthly roses in endless profusion; the climbers and ramblers and the moss roses. They must have the direct sun to succeed.

If you live upon a city lot, there is no reason why you can not raise some fruit—not a family supply, but for the pleasure of it; a few plants of pie-plant, set just anywhere; an asparagus bed three-by-six feet; a strawberry bed set so close as to step on the fruit in gathering. At least have grapes and roses if you have the necessary sunny exposure for them. And put in the shade between two houses a half dozen currant- and gooseberry-bushes. In the recess of the L of the house, if on the north, place a pear; if on the south, a peach. If you can replace a shade-tree with one or two apples as mentioned elsewhere, there will be a chance of gathering the fruit yourself, as only a few ripening at a time is not nearly the temptation as a tree full of bright red fruit. A cherry-tree is much too great a temptation for the small boy. As the red raspberry excels in delicacy of flavor all of the bush fruits, room might be found for a clump or row.

And now if you will persistently replace all trees and plants that fail and care for them until all are in full bearing, you will then find that you have added a cool thousand dollars to the selling price of your property; the word "home" will have a new significance and your family will not only be healthier and happier, but will be all the more industrious, thrifty and energetic.

Shade Trees for the Home.

E. F. STEPHENS, CRETTE, NEBRASKA.

A home whether in the country or town should be surrounded with stately shade-trees. They make a background or frame-work for the place. In a cold climate they are a shelter, while in a hot climate they give necessary shade, cutting off the burning rays of the sun from porch, lawn, or walks. They screen the south and west windows from the hot sunlight and make the home more beautiful, more comfortable, and more valuable. To plant trees is the most economical way of enhancing the value of property. A house may be built in a summer, while a home properly shaded by majestic elms can not be produced in a generation. Public parks not only contribute to beauty, comfort, and health, but enhance the value of property.

SELECTION OF VARIETIES.

Perhaps the elm should take first
(Continued on page 88.)

Great American Desert Seeds

are best for general use, are grown in the very heart of the region once known as the Great American Desert, at an altitude of over two thousand feet above sea level and without irrigation. They are time tried and drouth tested and have proved producers of profitable crops of both grain and forage. Write for list of specialties and prices.

RATEKIN'S SEED CORN

"Pride of Nishua" is a golden yellow, 16 to 24 rows; deep grains and small cob; matures in 95 to 100 days; of great vitality and strength to resist drouth and other unfavorable conditions; outyields any other yellow corn in existence, making from 60 to 100 bushels per acre on good land. "Ratekin's Silver Mine," white, has greatest record for large yields of any white corn in the world—averaging 176 bushels per acre in seven states; full counterpart of "Pride of Nishua".

Our Seed all grown from absolutely pure stock, especially for Seed purposes, is carefully selected, sorted, and butt and tip ends taken off, and is all graded to uniform size. Seed corn shelled and graded or in the ear. It is the kind that pays to plant. Change your seed and grow bigger and better crops. Price, \$1.35, shelled, sacked on board cars here. Our big Illustrated Catalog of all Farm and Garden Seeds is FREE if you mention this paper. Write for it today.

Address, RATEKIN'S SEED HOUSE, Shenandoah, Iowa.

THE KANSAS FARMER

The Poultry Yard

How Shall I Start?

A reader living in eastern Massachusetts asked the New England Farmer's advice as to doing more and better work with poultry on his farm, and says he has become convinced that eggs and poultry for market will pay him a better profit than any other line of farmwork.

This subject came up one day at the dinner table, during the poultry conference at Guelph, Ontario, and the New England Farmer editor asked three or four of the men present how they would answer such a question. One answered: "Get rid of his old, lousy, scrub hens and get good, pure-bred stock." The professor answered, sententiously: "Clean up!" The discussion which the several answers excited gave differing methods of reaching the same result, and the editor pitched upon the two answers given above as going to the root of the whole matter—only that he unites them into one answer.

He says: "That there is urgent need of a thorough cleaning-up of poultry house, or room, or quarters, on every farm where poultry is kept, there is ample evidence, and that such a cleaning-up will give best results, if joined with a getting rid of the old, lousy birds which are seen on most farms, goes without saying. Indeed, the getting rid of the old, common stock is generally the first step to recommend, because no self-respecting man will put the new, better birds into the filthy old house or room. Having decided to have better poultry, he will, from just common decency, put the quarters into decent condition to house them.

"The question is the most interesting at this time because we are at the beginning of a new season, when we are bringing on a new generation of poultry, and the spring is the most favorable time to start. This is supposing we are to start with hatching the new stock from eggs of pure-bred fowls, and that is doubtless the cheapest and easiest way in which to make a wholly new start. Starting in this way, that is, by buying eggs of the chosen variety, we can raise the new stock wholly free of the handicaps of the old by keeping the chickens wholly separate from the old, and then kill off for market every old bird on the place before the youngsters get mature and want the house-room. By having the house (or room) thoroughly cleaned up and whitewashed this summer, and keeping the youngsters wholly separate from the old birds, the youngsters should not get lousy when they come into their quarters in the fall, and they start into their winter's work innocent of that very serious handicap.

"Believing that a good many readers of this page are like minded, we will give a little space in several future numbers to a consideration of this question, namely, How Shall I start?

"Our friend says that he wants to have a hundred well-matured pullets to go into their winter quarters next fall, and asks how many eggs he should plan to incubate to assure that number. That there are many slips between the cup and the lip we all know, and if we were planning for a hundred pullets we would incubate eight hundred eggs, upon the expectation that we would need to incubate four eggs to secure one well-developed chicken, and that half the chickens would be pullets. That this is a conservative estimate many will claim, and there is the experience of Prof. Gowell, of the Maine Experiment station, last year, to back them up; the professor wanted 1,500 pullets and planned to incubate 9,000 eggs, estimating that he could raise a chicken from each three eggs incubated. The eggs hatched better than he expected (they were laid by dry-fed hens), and the chickens, being dry-fed, lived better than he expected, and he found himself in the fall the fortunate possessor of a few over 2,000 fine, "husky" pullets, and actually had to build an additional hundred-feet to his new poultry house to take care of the extra 500 pullets!

"By and large, however, we would think it the part of wisdom to be on the safe side, and would recommend our friend to incubate four eggs for every mature chicken he wants. If he is so fortunate as to have more than he wants, he can readily sell them for a good price—if they are of good stock. That is one of the great advantages of having good, pure-bred stock; you can turn it into cash in a day! Prof. Gowell had that opportunity with his

POULTRY BREEDERS' DIRECTORY.

BLACK LANGSHANS—Hens scoring 93 and upwards—headed by 2d and 4th prize cockerels from Kansas City 1906 show. Eggs, \$2 for 15; \$3.50 for 30; special price by hundred. Can fill orders at once. Mrs. C. S. Cross, Fair Acres Farm, Emporia, Kansas.

PARK VIEW FARM

WHITE PLYMOUTH ROCK EGGS for sitting—Fine stock; farm raised. Price, \$1 for 15; special price by the hundred.

BROUZY BREEDERS' DIRECTORY.

What Two Lice Can Do

They can virtually go right down in the poultry keeper's pocket and take the money. If left undisturbed the natural increase is so great that they soon multiply to a swarm that will sap the life of young chicks, breed disease in the pens and ruin profit.

Instant Louse Killer

(Powder or Liquid)

Kills lice on poultry, lice on stock, and ticks on sheep. It is harmless to use, and will effectively destroy cabbage worms, slugs on rose bushes, and bugs on cucumber, squash and melon vines. Instant Louse Killer is the original powder louse killer put up in round cans with perforated top. Look for the word "Instant" on the can —then you won't get an imitation.

The best and cheapest ear-mark made. It possesses more points of merit than any other make. Send or sample. T. B. Stoll, Beeville, Tex.

surplus, and a visiting poultryman offered him \$500 for 200 of those good pullets; two dollars and fifty cents apiece! They were not "fancy" Barred Rocks, either, although the offer was from a fancy poultry breeder and judge of pure-bred poultry at many large shows. They were simply good, pure-bred Plymouth Rocks, well-hatched, grown, and fully matured by October—and after the professor had declined his offer the poultry man making it told him they were the best average lot of Barred Rock pullets he had ever seen! Just think of it—and the man that said that has been breeding fine show stock for years and years! Possibly he, too, has yet something to learn about raising good, well-matured pullets."

Thoroughbred Poultry.

There are so many people who say, "a hen is a hen anyway," meaning by that that there is no difference between a thoroughbred hen and a mongrel, that it grieves on the nerves of the thoroughbred poultry breeder. The aim of all true poultry men is "more flesh and more eggs," and by their efforts these have been augmented from year to year. A recent article by T. F. McGrew, of New York, a poultry expert of National reputation, is right to the point. We take pleasure in quoting it. "In grandfather's time if the hens produced twenty-five or thirty eggs during the year, and the greater portion of these in the springtime, it was all that was expected of them. These were known as the dunghill or barnyard fowls. About 1867 the era of progress in poultry industry in this country commenced. The census of 1870 gave an average of about 30 eggs per hen per year from the limited information gathered. Thirty years later the census report credits about 70 eggs per hen as the average product of the United States. All of this increase has come from the one source of better poultry, created under the influence of the fancier, who pays special attention to what should be known as "Standard-Bred Poultry."

In the egg-laying contests conducted under either private, State or National control in this country, Australia or England, there has never been recorded to our certain knowledge an instance where mongrel or cross-bred fowls won the laurels or came anywhere near doing so. The best market poultry, the best turkeys and waterfowls of all kinds are those bred direct from some one of the many standard-bred varieties. If there is anyone who can gainsay these statements and prove us in error, let him do so; but so long as there can be no contradiction to these facts, why should anyone in the wide, wide world continue to harbor cross-bred, mongrel stock in hopes of making a profit therefrom, when the evidences are so overwhelming that only those who keep properly selected stock for the intended purposes, make money from the growing of poultry.

The best egg-producing hens, the best meat-producing hens, the finest market turkeys, ducks, and geese come into our markets only through the existence of standard-bred poultry. We have not in all our experience known of a single instance where "even value received in the keeping of poultry came from the possession of the common barnyard stock," and in every instance of profit and success, the ground work or foundation of the same is from some one or more of the standard-bred varieties. The expense of possessing good stock of this kind is so slight as to prevent no one from having the same. Gradually, from any farm, every single head of the old time, anti-dated, unvaluable stock can be sold, and the money received from same expended for some of the better kinds that anyone can hope to succeed with. These are facts that can not be gainsaid or disputed. Every one familiar with growing of poultry fully realizes this to be the condition. With this overwhelming proof all in one direction, how it can be possible for the agricultural interest of the country to cling to a single, old-fashioned hen in hopes of gaining something from her, is more than any of us, who are familiar with the situation that governs conditions which have increased the poultry products of this country from a mere pittance to over \$500,000,000 per year, can understand.

Mites and Hawks—Two Chicken Enemies.

In his lectures before the students of the Agricultural Department of the University of Missouri last week, T. E. Orr, Secretary of the American Poultry Association, gave methods of combating mites and chicken-hawks, that might easily be used by every Missouri housewife.

Mites, he says, may be gotten rid of

Cloth, net.....\$1.50

THE KANSAS FARMER CO.

Topeka, Kansas

by spraying the chicken-house with a mixture of one part crude carbolic acid and eight parts of carbon oil. This mixture he recommends in preference to mite exterminators sold by traveling agents.

Hawks, he claims, may be kept out of the poultry-yard by attaching bright pieces of tin, six by ten inches, to the trees and poles surrounding the quarters, by strings two feet long, so that the wind will make the bright metal dance in the sunlight.

Won a Moral Victory.

Miss Clara Logan, the Queen Titania of the Asbury Park baby parade, sat by a log fire, telling stories of children.

"A woman," she said, "reclined on a couch in her library one night with the light low, trying in vain to go to sleep.

"Beside her, on a table, was a dish of fine fruit.

"As she lay there she saw her little daughter tiptoe into the room in her long, white nightgown. The child, thinking her mother asleep, advanced cautiously to the table, took a bunch of grapes and stole out again.

"The mother was grieved at such misconduct on the part of her good little daughter, but she said nothing.

"Five minutes passed. Then back into the room crept the child, the grapes in her hand, untouched. She replaced them on the dish, and, as she departed, her mother heard her mutter:

"That's the time you got left, Mr. Devil."

It is a maxim, that those to whom everybody allows the second place have an undoubted title to the first.—Swift.

Man makes a death which nature never made.—Young.

Take Your Old Trusty Incubator

40, 60 or 90 Days Trial.

We want to send you the "Old Trusty" Book. You ought to read it before buying an incubator, because it has more every-day "chicken sense" in it than any catalog you have ever seen. 300 good pictures. It tells why "Old Trusty" does such good work—why it hatches so many and so good chicks—why it is so easy to operate—it is so economical. It is sold on 40, 60 or 90 day trial, freight prepaid. Write to us.

M. M. Johnson Co., Clay Center, Kans.

Dairy Interests

Balanced Rations for Cows.

Will you please give me the cheapest balanced ration for dairy cows from the following feeds and prices.

Please send me bulletin No. 115, and put my name on your mailing list.

Corn, shelled, per bu.....	\$ 0.36
Kafir-corn, seed, per bu.....	0.60
Oats, per bu.....	0.35
Bran, per ton.....	17.50
Oil meal, per cwt.....	2.25
Alfalfa hay, per ton.....	7.00
Kafir-corn fodder, per ton.....	3.50

Mitchell County. W. H. MEARS.

From the prices of the feeds given, the values per pound are easily calculated and found to be:

	Cents.
Corn64
Kafir-corn seed	1.07
Oats	1.10
Bran875
Oil meal	2.25
Alfalfa	7.00
Kafir-corn stover175

As Kafir-corn grain and corn are about equal in feeding value, with the advantage in favor of corn, we may at once cut out the former as too expensive at 60 cents per bushel. Kafir-corn fodder is your cheapest feed but it is not at all adapted to milk-production unless balanced by some highly nitrogenous feed. We can not see at a glance whether or not it will be economical to use it when so balanced. I am sending you a copy of Bulletin No. 115, and in Table IV, beginning on page 130, you will find about 2,700 balanced mixtures ready calculated for various purposes in feeding. Pages 128-9 give an explanation of the table and from the data which it contains you should be able to calculate for yourself what rations would be cheapest. However, to assist you I will calculate the cost of a few.

Let us begin with corn and alfalfa; that will certainly be a combination hard to beat for economy and efficiency. You do not say how much milk your cows are giving, but if we assume a nutritive ration of 1:6 for their ration we shall not be far wrong. That would be right for cows giving about sixteen pounds of milk per day. Turning to page 144 of the bulletin, we find under nutritive ratio 1:6 that corn and alfalfa must be used in the ratio of 30.8 of the former to 45.6 of the latter. If we add these two quantities together and divide each by the sum, it will give us the quantities of each to be taken for one pound of the ration. Thus: $30.8 + 45.6 = 76.4$; $30.8 \div 76.4 = 0.4$, and $45.6 \div 76.4 = 0.6$. Hence four-tenths of a pound of corn with six-tenths of a pound of alfalfa hay will give one pound of a ration with the nutritive ratio 1:6. From this you can easily calculate how much of each to weigh off for large amounts.

For each thousand pounds weight of herd you will need about 27.5 pounds per day in the ration. If in each pound there are four-tenths of a pound of corn, there will be $0.4 \times 27.5 = 11.0$ pounds of corn in 27.5 pounds of the daily ration, and $0.6 \times 27.5 = 16.5$ pounds of alfalfa. This, you notice, is a very good ratio between the grain and the roughage. The cost would be: $11 \times 0.64 = 7.1$ cents for the corn, and $16.5 \times 0.35 = 5.8$ cents for the alfalfa hay; total, 12.9 cents per day, per thousand pounds weight of herd.

In a similar manner, by making the calculations for other possible combinations of the feeds you name, we obtain the results exhibited in the following table:

Amount and cost of feeds balanced to a nutritive ratio of 1:6, and in quantities to make 11 pounds of concentrate and 16.5 pounds of roughage.

Balanced No. feeds.	Pounds of each feed.	Total pounds.	Cost of each feed.	Total cost of weight stated.
1. Corn	11.0	..	7.1	..
Alfalfa	16.5	27.5	5.8	12.9
2. Corn	8.6	..	5.5	..
Oil meal	2.4	11.0	5.4	10.9
3. Alfalfa	9.7	..	3.4	..
Kafir-corn stover	6.8	16.5	1.2	4.6
4. Corn	4.5	..	2.9	..
Bran	6.5	11.0	5.7	8.6
5. Bran	16.0	..	14.0	..
Kafir-corn stover	11.5	27.5	2.0	16.0
6. Oil meal	5.3	..	11.9	..
Kafir-corn stover	22.2	27.5	3.9	15.8

In the above table I have balanced Kafir-corn stover, your cheapest roughage, with the only three feeds which you name that will do, and I have balanced corn, your cheapest concentrate, with the only three of your feeds that can be used. To facilitate the compari-

son I have calculated them all to 11 pounds of concentrate and 16.5 pounds of roughage where possible, and to 27.5 pounds where the ration contains both the concentrate and roughage. In ration 3, the Kafir-corn fodder is balanced by alfalfa and the roughage ration of 16.5 pounds would cost but 4.6 cents. Either mixture, 2 or 4, could be used with it as a grain ration. Eleven pounds of the corn and oil-meal mixture would cost 10.9 cents, while the corn and bran mixture would cost but 8.6 cents. Adding together Nos. 3 and 4, you see that a ration consisting of 9.7 pounds of alfalfa, 6.8 pounds of Kafir-corn stover, 4.1 pounds of corn and 6.5 pounds of bran would cost 13.2 cents. It is therefore slightly dearer than the ration consisting of corn and alfalfa only. With this combination, however, you have the advantage of having the concentrate balanced within itself, and the roughage also balanced in the same way. If you wish to feed less or more concentrate than 11 pounds you can do so without disturbing the balancing of the ration in respect to protein and non-protein. This affords a convenient means of modifying the feed for individual animals. It is possible, too, that the greater variety afforded by this ration would give better results than the simpler one consisting of corn and alfalfa alone. You will readily see that Nos. 2 and 4 might be used as a part of the ration consisting mainly of No. 1.

No. 5 would be balanced, but has too much bran and too little stover for a practical feed; its cost, 16 cents, is almost the same as No. 6, which is scarcely practical either, requiring so large an amount of oil-meal. In any case Nos. 5 and 6 are cut out by their higher prices, though the two added together would make a double ration which would be about right in the relative amounts of concentrates and roughage. Reducing it to the same basis as the others, it would consist of 8 pounds of bran, 2.65 pounds of oil-meal, and 16.8 pounds of Kafir-corn stover.

I can not often give time to make such detailed calculations as the above, but in this case the question was so clear-cut, and the feeds so practical that it seemed to have more than ordinary interest. I should say in respect to the oats that they are in themselves practically a balanced ration for your cows, but at 35 cents a bushel are considerably more costly than the rations we have been considering. If you wish to use some for variety, you could replace part of the other ration by them.

J. T. WILLARD.
Manhattan, Kas.

Managing a Winter Dairy.

To achieve the highest degree of success in the management of a dairy at any time in the year, one should know the requirements and possibilities of each individual cow. The man to whom every dairy animal is only a cow, has yet to learn the first lesson in his business. The proper beginning, then, is to know the herd with which we have to deal.

I believe October and November are good months in which to have the cows come fresh. August and September abound in flies, in short pastures, and in labor upon the farm. They, therefore, constitute an opportune season for the cow's vacation. From four to six weeks is long enough, as a rule, for the animal to rest. As she nears the period of freshening, care should be given to her ration. Since the discovery of the new air treatment for milk fever, the danger of overfeeding at this time has been largely removed. There is no other period in the life of a cow when it

"CHEAPEST" AND "BEST" CREAM SEPARATORS

More truly is the best the cheapest in the purchase of a cream separator than in the purchase of any other farm machine. The really cheap cream separator is the one which will perform your work in the most profitable and satisfactory manner, and last the greatest number of years. Basing the value of the separator upon durability, without considering quality of work, if it lasts but two years it is worth only one-fifth of what the separator is that lasts ten years, and one-tenth of what the one is that lasts twenty years. In addition, if it loses a large percentage of cream and is difficult and expensive to operate its value is placed at even a still lower level. DE LAVAL cream separators are today admitted by every experienced user to do as near perfect work as a cream separator possibly can. Proof of this is seen in the fact that over 98 per cent of the world's creameries and all largest users employ the DE LAVAL exclusively. As to durability, the DE LAVAL has an average life of twenty years. The very best of other separators do not last over eight or ten years at the very longest, and the poorest generally become worthless in from six months to two years. At the same time these machines are incapable of doing perfect work except under ideal conditions, such as cannot possibly be had in farm use,—otherwise they lose a large percentage of the cream, are hard to operate, and in reality are but little better than gravity setting systems. It is therefore seen how little the first cost of a cream separator really means. The cost in the end is what counts. All in all considering dollar for dollar value, a DE LAVAL machine gives from five to ten times more true separator worth than any other machine on the market today. These are not mere paper claims but facts, proof of which can be had for the asking.

Cream is Cash

AT
The largest exclusive Cream Butter
Factory in the World

NO WAITING

NO DELAY

NO RISK

NO UNCERTAINTY

NO ANXIETY.

Cream shipped to us is paid for immediately.

Our motto is:

CORRECT WEIGHT,

HONEST TEST,

and the highest possible price for butter-fat.

Under this banner we have established an enormous business. Through a continuation of this policy, we expect to increase our business each month.

A cordial welcome awaits every enterprising milk-producer, who appreciates having his product handled economically so as to get the greatest returns and that in **Cash**.

It's a pleasure to answer letters. Will be glad to hear from you.

Very respectfully,

BLUE VALLEY CREAMERY CO.,
ST. JOSEPH, MISSOURI.

PEERLESS CREAM SEPARATORS

Reasons Why the PEERLESS Is the best

FIRST—Twice the capacity of any other bowl. That is to say two times smaller than any other bowl of equal capacity.

SECOND—Compound feature, two bowls in one, hollow bowl and disk bowl combining all the features of the tubular and disk machines.

THIRD—Enclosed frame. Free from dust. Injury resulting from machine impossible.

FOURTH—Perfectly noiseless.

FIFTH—Heavy enough and strong enough to lift a box-car, which insures durability.

SIXTH—The bushings made of phosphor bronze—the most serviceable material for the purpose. Fitted and guaranteed to be accurate to $\frac{1}{2}$ of 1-1000 of an inch.

SEVENTH—Every journal bushed with brass or phosphor bronze. This fact together with the fine adjustment described above, accounts for the light draft of the PEERLESS machine. Each busing is made in duplicate and interchangeable and if at any time they show wear they can be replaced at a small cost.

EIGHTH—at normal temperature the skimmed milk will always show less than 5-100 of 1 per cent butter fat and generally less than 1-100 of 1 per cent butter fat. PEERLESS CREAM SEPARATORS are guaranteed to anybody—everybody, anywhere—everywhere.

The Apiary

Different Races of Bees.

EDITOR KANSAS FARMER:—During the last several years a number of different varieties of honey-bees have been imported into the United States, such as the Cypriots, Carniolans, and more recently the Caucasians. In 1860 the Italians were introduced, and in 1864 I probably introduced the first Italian queen into the State of Indiana. I tested their merits side by side with the black, or German bees, which were the first bees brought to this country. I found the Italians superior to the blacks in the methods of defense against the bee-moth. They remained almost perfectly quiet on the combs, were gentler when being handled, and were harder. But I find that since the importation of Cypriots by queen-breeders, they have become in many cases crossed with these bees, and are much crosser when being handled than they were before thus being crossed. The Carniolans have also crept into the queen-breeding apiaries, and through crosses have increased the swarming inclinations of the Italians in many cases, which is at present one of the greatest evils that honey-producers have to contend with. None but populous colonies of bees are profitable to their owners as honey-collectors. The Carniolans, being most persistent swarmer, are on this account undesirable. The Caucasians resemble very much the common black bee, but it is claimed that they are much more docile in handling than any other race of bees known. I had a conversation with Professor Benton who has charge of the Bee-keeping Experimental Station at Washington, D. C. He is, however, absent at present, being in the far East in search of the large stingless bees found in the East Indian country. Professor Benton informed me that as far as tested, the Caucasians bid fair to become desirable bees. I have one Caucasian queen introduced late last fall, but she is mated so that her worker progeny will not prove fully what their merits may be. I will, however, try to observe as far as possible the difference, if any, in disposition from the Italians I have, but I shall not permit one of her drones to hatch out as I do not wish Caucasians crossed with my Italians at all. The drones of the queen will be pure as the fertilization of the queen does not in the least affect the purity of her drone progeny. My objection to crossing the Caucasians with the Italians is that I shall not believe them superior in any way to the Italians I now have until actual demonstration proves them so, and I will drop a word of warning to all our bee-keepers to proceed with caution in the matter of introducing the Caucasians. Also steer clear of the Cypriots and Carniolans or any strain of Italians that are very cross, as it is almost positive proof of a cross with Cyprian blood. The inclination to profuse or oft-repeated swarming shows the presence of Carniolan blood. But natural swarming is not permitted to any considerable extent in any well-managed modern apiary. Artificial swarming is practiced almost entirely for an increase of colonies. To get all there is in bees, it is necessary to have the colonies strong in numbers when the honey flow or season begins, so that there will be a force to collect and store it.

In the matter of purchasing Italian queens, caution should be used to get queens from the most reliable queen-breeders. I have no queens for sale as I am not now a breeder of queens for the market.

G. BOHRER.

Rice County.

Farm Notes.

Fattening animals should never be allowed to become hungry; nor, on the other hand, should they be fed too heavily. Too heavy feeding clogs the appetite and too long periods between feeds makes the animals restless.

The potato lot should be of rich, mellow soil, plowed deep and thoroughly prepared before planting the seed. Then give clean, thorough cultivation during growth.

While it is conceded that more stock can be kept on an acre by cutting the feed than by pasturing the same acre, yet the extra labor, unless the land is very high priced, will much more than balance this.

This Custom Is Now General.

It has now become a general and also a safe rule to demand brands of goods that are well known and have a reputation for quality and reliabil-

ity. Nowadays the manufacturers of good goods, inform consumers of this fact and point out that safety lies in buying the brands that bear their names and trade-marks.

In this respect the Mayer brands of shoes are deserving of special mention. Our readers have no doubt become familiar with these shoes and know of their excellent wearing quality by actual use. The Mayer factory turns out shoes suitable for every member of the family and for all uses, Sunday shoes and every day shoes, and they are known throughout the broad expanse of our land as the shoes of style and quality.

The "Honorbilt" are very popular fine shoes for men and "Western Lady" shoes embody the fit and style demanded by well-dressed ladies. For extreme comfort "Martha Washington" shoes are highly recommended. Please bear this in mind when next buying shoes.

Mail Order Banking.

Under our banking system, business men everywhere find it to their advantage to make remittances by checks, rather than by bank drafts, post office or express money orders. There are several good reasons for this, but the two principal ones are these:

(1) The convenience in paying a bill by simply writing out a check, thus making it a great time-saver as well.

(2) It gives the most satisfactory form of receipt for the payment made.

The farmer has become a business man. In the progress he has made made within the past ten years he has found it necessary, and greatly to his

GEORGE W. YORK. LOUIS P. SCOVILLE.

profit and convenience to handle his own financial affairs, rather than trust them to the local banker, lawyer or merchant. Our agricultural colleges, farm institutes, and great conventions, that relate to agriculture in various forms, have all advocated the importance of the farmer paying more attention to the financial end of his business. Instead of being isolated from the great commercial centers, as was the case in the earlier days, he has, through the means of modern transportation facilities, rural mail routes, telephones and interurban railways, become very closely identified with these great centers. His home is his business office, and instead of spending time driving considerable distances to his local town and making expenditures for things that many times he does not want, he has brought to his home the great mail order catalogues, and when he wants to make his selection, which is usually done in conference with the whole family on a rainy day, or in the evening, he simply writes his order, encloses a check, and the mail order merchant does the rest.

A recent difficulty has arisen with reference to personal checks, because of the excessive exchange charge imposed by local banks. The local banker is usually biased in favor of the local merchant, because he is his best customer. The farmer who wants to save from 25 to 50 per cent on his purchases—which he can do through the modern mail order method of buying—finds his local bank a bank of deposit only. How much better it would be for the farmer to make his deposits in a bank in a great mail order center like Chicago. Banking by mail has become an established fact, and to keep progress with the great mail order movement, the Ravenswood Exchange Bank, of Chicago, Ill., has arranged to carry farmers' accounts, allowing them to draw their checks on this bank for their purchases, which will be accepted anywhere without exchange. This will be a great convenience to farmers everywhere.

Mail order merchandising is conducted in the city of Chicago to the amount of \$200,000,000 annually.

Chicago is the greatest live stock market in the world. Many of our farmers make direct shipments to commission houses at the Union Stock Yards and receive checks in return. It can be arranged to have these checks sent to this bank for deposit to the account of the farmer without exchange charges.

Chicago is likewise the great produce center, and commission houses here are remitting millions of dollars annually to the farmers direct. By the plan proposed, the farmer can have this placed to his deposit and receive the credit note from the bank.

Chicago is also the great grain market and the same rule applies in that case.

This mail order banking proposition is best explained through the literature the Ravenswood Exchange Bank, of Chicago, Ill., will send to any one asking for it.

The Ravenswood Exchange Bank is composed of men who have had agricultural experience and are familiar with the requirements of the farmer along banking lines. The president, Mr. Louis P. Scoville, under whose direct supervision the mail order business is conducted, is a director in White's Class Advertising Co., an advertising agency that handles extensively agricultural advertising accounts, and is thus placed in close touch with the great consuming interests of the country.

Mr. George W. York, a director of the bank, is also treasurer of White's Class Advertising Co., and has had more than twenty years' experience in business lines directly affecting important branches of agriculture. He is publisher, likewise, of the American Bee Journal, the oldest bee paper in

JUST ISSUED

Farm Grasses of the United States

By W. J. SPILLMAN

Agrostologist, U. S. Department of Agriculture

An intensely practical discussion of the farm grasses of the United States of America is presented in this volume. It is essentially a resume of the experience of American farmers with grasses, and it is safe to say that no other work has covered the ground so thoroughly. No attempt has been made to give a connected account of all the grasses known in this country, but the aim has been rather to give just the information which a farmer wants about all those grasses that have an actual standing on American farms. The whole subject is considered entirely from the standpoint of the farmer. One of the most valuable features of the book is the maps showing, at a glance, the distribution of every important grass in the United States; and the reasons for the peculiarities in this distribution are fully brought out. The principal chapters treat on the grass crop as a whole and the relation of grass culture to agricultural prosperity, meadows and pastures, the seed and its impurities; the bluegrasses; millets; southern grasses; redtop and orchard grass; bromo grasses; grasses for special conditions; haying machinery and implements; insects and fungi injurious to grasses, etc., etc. The methods followed on some pre-eminently successful farms are described in detail, and their application to grass lands throughout the country is discussed. The discussion of each grass is proportional to its importance on American farms.

This book represents the judgment of a farmer of long experience and wide observations regarding the plan in agriculture of every grass of any importance in American farming. In its preparation its use as a text book in schools as well as a manual of reference for the actual farmer has constantly been kept in mind. The book is most conveniently arranged and splendidly indexed, so that the reader may find any subject at a glance.

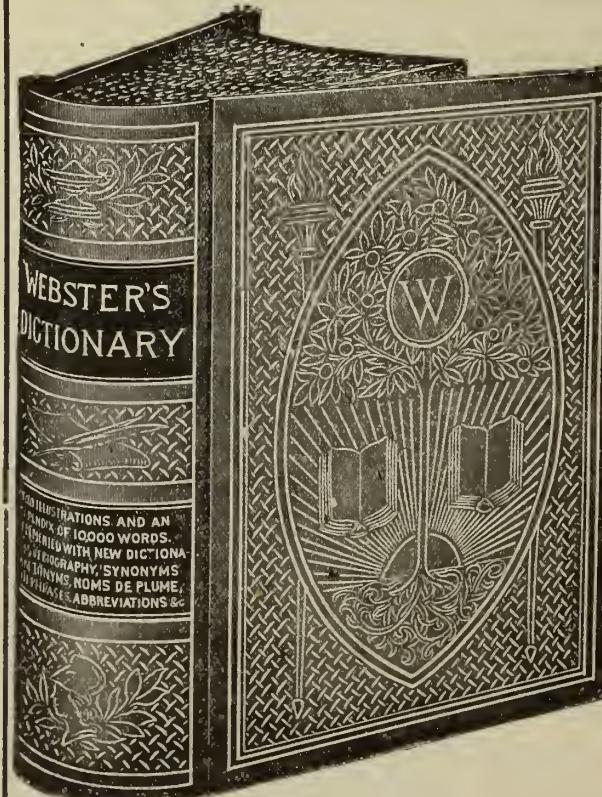

Illustrated, 5x7 inches, 248 pages. Cloth Price, postpaid, \$1.00.

Mr. Frank B. White, president of White's Class Advertising Co., who is well known by the agricultural fraternity because of his long service in connection with the advertising business, always a specialist in agricultural lines, has this to say about this plan intended for farmers to conduct their banking by mail:

"I most heartily approve of the plan proposed by the Ravenswood Exchange Bank to conduct a banking business by

mail, particularly in behalf of farmers. Both Mr. Louis P. Scoville and Mr. George W. York are interested in my company, and I know them to be thoroughly competent, honorable, safe and conservative. I am also acquainted with the vice-president, Dr. W. C. Abbott, whom I know to be a successful publisher and manufacturer, and who has recently become interested in this splendid institution. I am sure that the plan they propose is going to be of great advantage to the farmers everywhere, because of the convenience and

scene of a fierce conflict, but since provisions have gotten up so high the market shows more life and less resistance from the packers. Pork has passed the \$16 mark, and Saturday's hog market was the best of the year, top \$6.37 1/2. Market is 5¢ lower to-day, top \$6.32 1/2, bulk \$6.20 @ 6.30, supply 6,000. It is believed the market will break as soon as shipping conditions become normal in the country, because of the big runs then.

Sheep and lambs weakened 10@15 last week, although receipts were moderate at 31,600 head. Supply to-day is 16,000, market 5@10c lower, lambs selling at \$5.80 @ 6.40, wethers and yearlings \$5.35 @ 5.75, choice yearlings would bring \$5.90. ewes \$4.25 @ 5.25. Some 53-pound lambs sold at \$5.30 for the country last week, and some partly finished lambs, 67 pounds, were taken out at \$6. J. A. RICKART.

South St. Joseph Live Stock Market. South St. Joseph, Mo., March 26, 1906.

An unusually heavy proportion of beef steers were included in the cattle supply last week, and the market on that class was lower Tuesday and Wednesday, but regained strength Thursday and Friday, closing the week with only a small loss. Circulars were sent out announcing a decline of 15@25c, but best authorities declare that prices for the week averaged only a shade under previous week, and closed up right at the highest point of the winter. At the worst time, light steers sold nearly steady, main weakness being shown on heavy cattle. Cows, heifers, and bulls continue scarce and stronger, and stockers and feeders took a spurt upward on account of the very small supply offered, rather than any improvement in condition of country roads, feed lots or pastures.

The cattle run to-day is 10,000 head, same as last Monday. The run last week was 38,100 head, smallest week this year. Market is steady on beef steers to-day, butcher cattle strong, also stockers and feeders in better demand. The rain last night, and warmer weather this week will soon settle the mud, and a sharp trade in country grades is looked for this week. The top steers last week sold at \$5.75, top to-day \$5.30, bulk of steers \$4.60 @ 5.25, very few steers below \$4.50, top heifers \$5.15, most of the good heifers \$4.35 @ 4.75, top cows \$4.65, bulk \$3.25 @ 4.25, bulls \$3.25 @ 4.25, veals up to \$7 again, stockers and feeders mostly at \$3.40 @ 4.50, a few cattle both below and above these prices, fancy feeders \$4.90 @ 5. The hog market continues to be the

was quickly absorbed at steady to strong prices.

The moderate supply of hogs was made up of the best quality seen here in the last two or three weeks. The demand was pretty good, but with Chicago having nearly 60,000 and reporting a big break, sellers here were compelled to accept the decline at right to be compared with last week's closing figures, the bulk selling at \$6.20 @ 6.27 1/2 with top at \$6.30. These prices are considerably higher than a week ago, and the market appears to be in very good condition.

The receipts of sheep were fairly liberal, although not nearly as large as a week ago. The live markets reported less than 6,000 less than last Monday, the demand was quite good, and with quality running better than it did on the closing days of last week, the market showed quite lively movement with prices steady to strong, best lambs selling at \$6.45, with bulk at \$6.25 @ 6.40, and good fat ewes sold at \$6.25 and were considered strong. The market is hardly in condition to stand a repetition of the enormous receipts of last week.

CATTLE.

saving, and furthermore because of the interest to be paid on deposits, all of which they explain in their literature."

Passengers east from Chicago to Fort Wayne, Findlay, Fostoria, Cleveland, Erie, Buffalo, New York City, Boston, and all points east, will consult their interests and find advantage in selecting the Nickel Plate road east from Chicago. Three through trains are run daily, with through day-coaches to New York City, and modern Pullman sleeping-cars to destination. Rates always the lowest, and no excess fares are charged on any train, for any part of the journey. Modern dining-car service, with individual club meals, ranging in price from 35 cents to One Dollar; also meals a la carte. Ask for tickets via the Nickel Plate Road. Chicago depot, La Salle and Van Buren Streets, the only station in Chicago on the Elevated Loop. Chicago City Ticket Office, 111 Adams Street. Detailed information may be secured by addressing John Y. Calahan, General Agent, No. 113 Adams St., Room 298, Chicago.

The Fairbanks-Morse Company is always progressive. In order to meet a demand from up-to-date farmers, it has lately devised and put upon the market an electric-light and power plant to be run by its gasoline engines and especially adapted for farmers use. This plant is arranged to light the house and farm-buildings, or to be applied as power, in pumping, sawing wood, feed-grinding and other farm-work where power is needed. This firm has lately sent Prof. B. F. Eyer, of the department of physics and electrical engineering of the Kansas Agricultural College, two machines of this type to be tested. One of these is a nine horse-power, gasoline electric machine and the other is of two horse-power. When these machines have been thoroughly tested, the KANSAS FARMER will publish results.

Quick Meal Chick Feed is a dry feed in which there is practically no waste. It contains cracked and broken grains of all sorts. Millet, rape, and other small seeds, beef, bone and grit, charcoal and other choice ingredients and does not induce over-gorging or clogging, but tends to produce rugged, hardy chicks, always ready for their ration. Yes, it contains some grit because grit is just as necessary to the chicken as teeth are to other animals. They need the grit to digest their feed and this is admitted by every known authority on chicken feeding. The Steinmesch Co. has issued a neat booklet which explains the advantage of using this valuable feed, and may be had by addressing Steinmesch Feed & Poultry Supply Co., St. Louis, Mo.

Grain in Kansas City.

Receipts of wheat in Kansas City yesterday were 91 cars; Saturday's inspections were 31 cars. The larger offerings and weak future markets made carlots sell slowly. A few cars of choice milling wheat brought steady prices, but the remainder averaged 1c lower. The sales were: No. 2 hard, 1 car choice yellow 82c, 1 car 77 1/2c, 3 cars 77c, 1 car 76 1/2c, 1 car 76 1/2c; No. 3 hard, 1 car 75 1/2c, 3 cars 75c, 2 cars 74c; No. 4 hard, 1 car 68c, 1 car 67 1/2c, 1 car 67 1/2c, 1 car 64c; rejected hard, 3 cars 64c; No. 2 mixed, 1 car 80c; No. 3 mixed, 1 car 77c; No. 4 mixed, 1 car 64c, 1 car 62 1/2c; No. 2 red, 2 cars 94c; No. 3 red, nominally 86@91c; No. 4 red, 1 car 87c, 1 car 85c, 1 car 83c.

Receipts of corn were 54 cars; Saturday's inspections were 16 cars. Carlot arrivals were large enough to depress prices about 1/2c. The demand was moderate. The sales were: No. 2 white, 5 cars 42 1/2c; No. 3 white, 10 cars 42c; No. 2 mixed, 3 cars 41 1/2c, 3 cars 41 1/2c; No. 3 mixed, 7 cars 41 1/2c; No. 2 yellow, 4 cars 42c.

Receipts of oats were 29 cars; Saturday's inspections were 7 cars. There was a fair demand, and prices held up well considering the increased offerings. Sales were made as follows: No. 2 white, 4 cars 32c, 1 car 31 1/2c; No. 3 white, 1 car 31c, 2 cars 30 1/2c, 1 car color 30 1/2c; No. 4 white, 1 car 30 1/4c; No. 2 mixed, nominally 30@30 1/2c; No. 3 mixed, 1 car 29 1/2c; No. 4 mixed, 2 cars 29 1/2c.

Barley was quoted 39@40c; rye, 56@58c; Kafir-corn, 65@66c per cwt.; bran, 86@88c per cwt.; shorts, 90@95c per cwt.; corn chaff, 80@82c per cwt.

Kansas City Live Stock Market.

Stock Yards, Kansas City, Mo.

Monday, March 26, 1906.

An unusually heavy proportion of beef steers were included in the cattle supply last week, and the market on that class was lower Tuesday and Wednesday, but regained strength Thursday and Friday, closing the week with only a small loss. Circulars were sent out announcing a decline of 15@25c, but best authorities declare that prices for the week averaged only a shade under previous week, and closed up right at the highest point of the winter. At the worst time, light steers sold nearly steady, main weakness being shown on heavy cattle. Cows, heifers, and bulls continue scarce and stronger, and stockers and feeders took a spurt upward on account of the very small supply offered, rather than any improvement in condition of country roads, feed lots or pastures.

The cattle run to-day is 10,000 head, same as last Monday. The run last week was 38,100 head, smallest week this year. Market is steady on beef steers to-day, butcher cattle strong, also stockers and feeders in better demand. The rain last night, and warmer weather this week will soon settle the mud, and a sharp trade in country grades is looked for this week. The top steers last week sold at \$5.75, top to-day \$5.30, bulk of steers \$4.60 @ 5.25, very few steers below \$4.50, top heifers \$5.15, most of the good heifers \$4.35 @ 4.75, top cows \$4.65, bulk \$3.25 @ 4.25, bulls \$3.25 @ 4.25, veals up to \$7 again, stockers and feeders mostly at \$3.40 @ 4.50, a few cattle both below and above these prices, fancy feeders \$4.90 @ 5. The hog market continues to be the

was quickly absorbed at steady to strong prices.

The moderate supply of hogs was made up of the best quality seen here in the last two or three weeks. The demand was pretty good, but with Chicago having nearly 60,000 and reporting a big break, sellers here were compelled to accept the decline at right to be compared with last week's closing figures, the bulk selling at \$6.20 @ 6.27 1/2 with top at \$6.30. These prices are considerably higher than a week ago, and the market appears to be in very good condition.

The receipts of sheep were fairly liberal, although not nearly as large as a week ago. The live markets reported less than 6,000 less than last Monday, the demand was quite good, and with quality running better than it did on the closing days of last week, the market showed quite lively movement with prices steady to strong, best lambs selling at \$6.45, with bulk at \$6.25 and were considered strong. The market is hardly in condition to stand a repetition of the enormous receipts of last week.

SWINE.

NEW BOOK JUST ISSUED

SUCCESSFUL FRUIT CULTURE

A Practical Guide to the Cultivation and Propagation of Fruits.

By SAMUEL T. MAYNARD,
Formerly Professor of Horticulture at the Massachusetts Agricultural College.

This book is written from the standpoint of the practical fruit grower; it is up to date in every particular, and covers the entire practice of fruit culture. It gives in plain, practical language, descriptions of such varieties as are most in demand in our markets, and the methods practiced by the most successful cultivators of many sections of the country. Separate chapters are devoted to the apple, pear, peach, apricot and nectarine, plum, cherry, quince, mulberry, grape, blackberry, raspberry, cranberry, strawberry, blueberry, huckleberry, subtropical fruits, propagation of fruit trees and plants, fruit growing under glass, insect pests and fungous diseases. The chapter on the apple is particularly comprehensive and complete, forming a monograph in itself. The chapter on forcing peaches, grapes, strawberries, and other fruits, describes the most successful methods of the present day, and is the most recent practical treatise on this important industry.

Illustrated, 5x7 inches, 265 pages. Cloth.

Price, postpaid, \$1.00.

Shade Trees for the Home.

(Continued from Page 355.)

place, particularly for city and town planting. With the use of fertilizers it can be crowded to an annual growth of three to five feet in height and an annual increase in diameter of at least an inch.

The American Linden with little care grows in good form, giving trees of large size, symmetrical head and great beauty. The sycamore may also be planted.

The Carolina poplar is oftentimes planted on real-estate additions where very speedy results are desired. This tree can be pushed to the growth of four to eight feet in a season and will make a large-sized tree in less time than any other.

If judiciously trained, the soft maple will give satisfactory results. Those who are willing to wait longer and give more time may plant the Norway and sugar maples.

The Catalpa speciosa grows with rapidity and transplants with great ease and certainty. Its mass of bloom is particularly attractive in June. By reason of its fleshy roots it can be transplanted when of large size. It has no insect enemies and can be planted with confidence.

Some varieties of trees may be used to advantage in grouping. The white birch contrasts in a pleasing way with trees of darker bark. The brilliant bloom of the redbud, appearing before the leaves, makes a tree very desirable for early spring.

The oak-leaf mountain ash never attains very large size. It may be used as a specimen tree, standing alone, or as one of a group. An occasional tree of the honey-locust may be used. The writer remembers a very symmetrical tree of this variety planted on the grounds of the late J. Sterling Morton, at Nebraska City. Its fine foliage makes this tree attractive. The cut-leaf, weeping birch is occasionally planted in sheltered grounds, and where conditions are favorable this choice tree gives satisfaction.

The hackberry is indigenous to Central and Western Nebraska. The foliage endures the coal smoke of town. The tree carries rather more foliage than the elm and is well suited to Western Nebraska.

PLANTING.

In our climate it is better to plant in early spring. The very best time to transplant any tree is just as the sap is moving and the buds swelling. At this time new rootlets are quickly formed, assuring continued supply of sap.

In preparation for planting it is well to stake out the grounds for planting, so that each tree when planted may fit in as a part of the whole. It is well to dig the holes a foot deeper than would naturally be required by the size and amount of roots. In width, the hole should be a foot wider each way than the roots of the tree extend. In refilling the hole, secure well-aerated surface soil and the more fertile the better. The tree should be planted four to six inches deeper than it grew in the nursery row. After the tree is solidly planted and earth has been filled in and tramped four inches above the roots, add two or three pails of water, or enough to saturate the soil. Then fill in two or three inches of very fine, old manure, that which has rotted for years is best suited to this work. The first office of this application is to increase the fertility of the soil. The second is, it acts as a mulch, lessening the evaporation of moisture. Over this fill to surface level and either leave and keep the surface loose by frequent cultivation, or mulch to the width of six to eight feet about the tree. Since the tree in transplanting suffers considerable loss of root, it is quite important that this should be partially balanced by judicious cutting back of top.

In order to shape a shade-tree so it will not break down during a storm, it should be remembered that a tree, with a straight, central trunk from which the side branches spread out horizontally, will not split down. A forked tree with two nearly equal branches may split off one. To correct the fork remove one branch, watching for other forks during the growth of the tree. In trimming shade-trees of considerable size, do not cut back to bare poles with short stubs of limbs. Leave a considerable number of small branches, twigs, and buds that shall expand and help to use the natural circulation of the sap.

TRUNK PROTECTION.

Since trees of all kinds while growing in nursery row, or for that matter in timber, have the trunks closely shaded, the bark is sensitive to the ex-

treme power of sun and wind. It is therefore important to completely wrap the trunks of trees at planting time to lessen the evaporation. In case of very large trees this is usually done with rope twisted from hay or straw. With smaller trees wrapping burlap will be sufficient. This suggestion is of very great importance. It lessens the effect of the sun and wind and is likely to guard against the attack of injurious insects.

EVERGREENS.

Evergreens may be used as shelter-belts or in groups and occasionally in single specimens. They transplant to best advantage if moved just as the buds are swelling. This varies with different varieties. The pine family may be transplanted in the first half of April.

The red cedar will do better if not moved until late April or early May, and should the season be cold and backward perhaps even later, watching for the time when the buds are swelling and new rootlets would be most quickly pushed forward to support the transplanted tree.

In the transplanting of evergreens it is found advantageous to water the ground where they stand quite freely before removal. Allow the trees to drink and fill themselves for a day or two before transplanting. In this way they store up moisture enough to materially assist them in overcoming the shock of removal. Since the evergreen tree is always in leaf, more care is required in transplanting than in handling a deciduous tree which is usually transplanted when not in leaf.

It is of the utmost importance to protect the roots of evergreens from exposure to sun or wind. Since the evergreen sap is resinous in character, it very rapidly sets or hardens and does not liquify or start afterwards. A few minutes exposure of the roots of evergreens to sun or drying wind is usually equivalent to the loss of the tree, although the tree may look well for some days or weeks thereafter.

Fruit Prospects.

Reports on fruit conditions from about forty counties received by Secretary W. H. Barnes of the State Horticultural society, indicate that the prospects at the present time are equally as good as they have been at this season at any time in recent years.

With the exception of peaches, fruit is in good shape. Peaches in many counties have been damaged by cold weather and in some counties are dead.

The report by counties reads:

Bourbon—Small fruits not hurt.

Sedgwick—Hurt a little; not bad.

Barber—No harm to speak of.

Jefferson—Condition still good.

Jackson—Half of tender peaches dead; prospects still good.

Douglas—Tree fruit still safe.

Sumner—Fruit still safe.

Geary—Fruit still safe.

Wyandotte—No damage; best prospect for years.

Marion—Some apricots and plums hurt; other fruit all right.

Shawnee—Plums, some killed; peaches, Elberta and Crawford, 90 per cent killed; Amsden, Crosby, Early Rivers and hardy seedlings all right; grapes good; pears, Keifler hurt, Seckel all right; apples all right.

Franklin—Nothing hurt but a few peaches.

Wabaunsee—Everything in good shape except apricots.

Montgomery—Prospects never better.

Kearny—Everything safe except a few apricots and peaches.

Butler—Prospect good.

Leavenworth—Fruit prospects fine.

Osborne—Crop is uncertain.

Nemaha—Prospects good; no damage.

Riley—Peaches, Elberta mostly dead;

Family Favorites and seedlings, half of buds alive; grapes and small fruits show a prospect for a full crop.

Allen—No dead peach-buds; other fruits in heat of condition.

Brown—Prospects for good crop general.

Johnson—No fruit killed and prospects good.

Russell—Peaches damaged some, but enough live buds left to insure a good crop. All other fruit in good shape except apricots.

A queer method of fishing is used by the Chinese. The fisherman lets down from the side of the boat a screen of white canvas. The shoni of fish mistake this for some floating obstruction and try to leap over it, with the result that the fish jump in the boat and are thus captured. This method is employed by Malays in their waters.

MIDDLE LIFE

A Time When Women Are Susceptible to Many Dread Diseases—Intelligent Women Prepare for it. Two Relate their Experiences.

The "change of life" is the most critical period of a woman's existence, and the anxiety felt by women as it draws near is not without reason.

Every woman who neglects the care of her health at this time invites disease and pain.

When her system is in a deranged condition, or she is predisposed to apoplexy, or congestion of any organ, the tendency is at this period likely to become active—and with a host of nervous irritations make life a burden. At this time, also, cancers and tumors are more liable to form and begin their destructive work.

Such warning symptoms as sense of suffocation, hot flashes, headaches, backaches, dread of impending evil, timidity, sounds in the ears, palpitation of the heart, sparks before the eyes, irregularities, constipation, variable appetite, weakness, inquietude, and dizziness, are promptly heeded by intelligent women who are approaching the period in life when woman's great change may be expected.

Lydia E. Pinkham's Vegetable Compound was prepared to meet the needs of woman's system at this trying period of her life. It invigorates and strengthens the female organism and strengthens the weakened nervous system.

For special advice regarding this important period women are invited to write to Mrs. Pinkham at Lynn, Mass., and it will be furnished absolutely free of charge. The present Mrs. Pinkham is the daughter-in-law of Lydia E. Pinkham, her assistant before her decease, and for twenty-five years since her advice has been freely given to sick women.

Read what Lydia E. Pinkham's Compound did for Mrs. Hyland and Mrs. Hinkle:

Dear Mrs. Pinkham:

"I had been suffering with displacement of the organs for years and was passing through the change of life. My abdomen was badly swollen; my stomach was sore; I had dizzy spells, sick headaches, and was very nervous.

Lydla E. Pinkham's Vegetable Compound Succeeds Where Others Fail.

"I wrote you for advice and commenced treatment with Lydia E. Pinkham's Vegetable Compound as you directed, and I am happy to say that all those distressing symptoms left me and I have passed safely through the change of life, a well woman. I am recommending your medicine to all my friends."—Mrs. Annie E. G. Hyland, Chester-town, Md.

Another Woman's Case

"During change of life words cannot express what I suffered. My physician said I had a cancerous condition of the female organs. One day I read some of the testimonials of women who had been cured by Lydia E. Pinkham's Vegetable Compound, and I decided to try it and to write to you for advice. Your medicine made me a well woman, and all my bad symptoms soon disappeared."

"I advise every woman at this period of life to take your medicine and write you for advice."—Mrs. Lizzie Hinkle, Salem, Ind.

What Lydia E. Pinkham's Vegetable Compound did for Mrs. Hyland and Mrs. Hinkle it will do for other women at this time of life.

It has conquered pain, restored health, and prolonged life in cases that utterly baffled physicians.

Barn Plans and Outbuildings

New, revised and greatly enlarged edition,
Modernized and brought up-to-date

EDITED BY EDWIN C. POWELL

A reliable guide to those intending to build new barns or to remodel old farm buildings for any and all purposes.

The proper and economical erection of barns and outbuildings requires far more forethought and planning than was ordinarily given to their construction. But with modern ideas, proper appreciation of sanitary conditions, and the use of labor-saving implements, a barn that twenty-five years ago was considered perfect would not meet present requirements.

Outline of Contents:

After an introductory chapter on the general rules to be observed in barn building, special chapters give detailed information and illustrations on

GENERAL FARM BARNES
CATTLE BARNES AND STABLES
DAIRY BARNES
CATTLE SHEDDERS
SHEEP BARNES AND SHEIRS
PIGGRIES
POULTRY HOUSES
CARRIAGE HOUSES AND HORSE BARNES
CORN HOUSES AND CRIBS
ICK HOUSES

ICE HOUSES AND COOL CHAMBERS
DAIRY HOUSES
CREAMERIES AND CHEESE FACTORIES
SPRING HOUSES
GRANARIES
SMOKE HOUSES
BOO KENSELS
BILDS
ROOT CELLARS AND ROOT HOUSES
BUILDINGS OF VARIOUS KINDS, ETC., ETC.

All descriptions and directions contained in this volume are given in so plain and clear a manner as to be readily understood by anyone. Every professional builder, and every person, be he farmer or otherwise, who intends to erect a farm building of any kind, can, in this book, secure a wealth of designs and plans for a very small sum.

With 375 illustrations, 5 x 7 inches, 401 pages.

Cloth, price, postpaid, \$1.00

FRANK IAMS

and his "Big 4" three year old Percheron stallions, weight 8340 pounds. Winners of 1st, 2d, 3d and 4th prizes at Iowa and Nebraska 1905 State fair (over all). They are "sensational show stallions"—"Iams' sort." Iams sells models like these "Peaches and Cream" stallions at \$1000 and \$1500. It's up to you, Farmer John! Will you be "humble gaged" by "bunco salesmen?" Iams owns and sells more 1st-class stallions than any man in the United States. He has his "selling clothes" on, no man with cash or bankable note gets away from Iams. "Back up," Bill, see Iams' daily "Horse show" and his "town of horse barns" filled to the roof with wide-as-a-wagon "black boys."

SO—STALLIONS—SO

2 to 6 years old, weight 1700 to 2600 pounds, 90 per cent blacks, 50 per cent tan stallions." All registered, approved and stamped by European Government. Dad, it's "100 to 1" that Iams is pushing his competitors off the roof and hypnotizing his buyers with "top notchers" at 50 cents on the dollar, "let live prices." Iams' "horse show" at Iowa and Nebraska State Fair was the "talk of the town." The "best ever." All winners and sons of winners. His 2, 3 and 4 year old Percherons, Belgians and coach stallions won every 1st, 2d, sweepstakes and grand sweepstakes prize at Nebraska State Fair. At Iowa State Fair they were winners of 90 per cent of same prizes in above classes, and the Iowa and Nebraska people said Iams is a "hot advertiser," but "he has the goods" better than he advertises. Teddy, it's "10 to 1" that Iams' "Peaches and Cream" stallions are "hot stuff" (for competitors). "It's a cinch" that Iams saves his customers thousands of dollars in commissions and middlemen's profits. Iams places \$1000 insurance for \$60.

\$1000—SAVED AT IAMS'—\$1000

Ikey! What a rich graft these "slick stallion salesmen" are working on the honest farmer selling 4th rate stallion at \$2000 to \$5000. Iams sells "top notchers," so good, big and cheap that they do not need to be peddled to be sold. Mr. Buyer, see Iams' stallions yourself. Take no "gold brick stallion salesman's" word. Iams has "the goods" you read about. His establishment is worth going 2000 miles to see. Iams makes his competitors "holler." He is knocking "high prices" out of the X'mas tree. Iams saws wood, "butts in," sells more stallions each year. He makes every statement good. Georgie, dear! Buy a stallion of Iams. His \$1200 stallions are much better than our neighbors paid those Ohio men \$4000 for. Then I can wear the diamonds. Iams speaks the languages, buys direct from breeders, pays no buyers, salesmen or interpreters, has no two to ten men to divide profits with. Iams guarantees to sell a better stallion at \$1000 to \$1500 than are sold to Stock Companies for \$2500 to \$5000 by slick salesmen, or pay you \$100 for your trouble, you the judge. Iams pays horses' freight and buyer's fare; gives 60 per cent breeding guarantee. Write for eye-opener and greatest horse catalogue on earth. The Lincoln Importing Horse Com'y

Lincoln, Nebraska

Now we are here with our catalog. It is ready for distribution. Parties contemplating buying stallions write for catalog. Remember, every stallion represented in the catalog is of our own importation and all of them this year's importation, except the group of three. We also have a large number of stallions not exhibited in our catalog. Note what we say in regard to this group. The three weigh 5,890 pounds; the largest stallions in the West in the same flesh. Some of our 2-year-olds of our last importation will tip the scales at 1,850 to 1,900 in only moderate flesh. Come and examine them at our expense if you find that we have misrepresented to you. Remember, our scales are in front of our office. You do your own weighing.

SHORTHORN EVENT EXTRAORDINARY *At Fredonia, Kansas, April 13, 1906*

...ALL GOOD ONES...

The Southeastern Kansas Improved Stock Breeders' Association have decided to make their annual Spring sale at Fredonia, Kansas, the most important event not only of their circuit but of Kansas for this year. We know that we must offer good cattle to have a good sale, and we are offering our best cattle—all good ones.

We know it will not do to try to make a few good ones sell a lot of culs, so we are offering absolutely all good ones. Tabulated pedigrees will show animals by the following great Scotch and Cruickshank bulls: Imported Collynie, imported Mariner, imported Choice Goods, imported Lord Cowslip, imported Tillycarn, Battle Axe, and Golden Victor, Jr., of Harris breeding; Scottish Emperor, of Bellows breeding; Kinellar, Captain Archer, and Aberdeen, of Hanna breeding. :: :: ::

The map of Kansas shows its 105 counties and their names. It is bordered by Colorado to the west, Nebraska to the north, Missouri to the east, and Oklahoma to the south. The state is also labeled with "IND. TER." (Indian Territory) to its southeast.

Volume XLIV. Number 14

TOPEKA, KANSAS, APRIL 5, 1906

Established 1863. \$1 a Year

The Y. M. C. A. Building Kansas State Agricultural College

My Farmer Friends:—Perhaps few of you are acquainted with the efforts which we have been making at the Kansas Agricultural College for the past two years with reference to raising a certain sum for the construction of a Y. M. C. A. Building for the Agricultural College students. You know something of the work of the Young Men's Christian Association in the cities and in the colleges of the land. It is a splendid organization and is accomplishing a grand work in developing Christian citizenship and in raising the standard of manhood in our colleges and cities. It is a necessary organization in every university or college.

We have a strong Y. M. C. A. organization at the Agricultural College, but the students have been hampered by not having proper accommodations in the way of buildings and equipments for carrying on the work of the organization. Nearly two years ago our worthy secretary of the College Y. M. C. A., W. W. McLean, originated the plan of raising a certain sum for the construction of a suitable building to be the home and headquarters of the Y. M. C. A. of this college. The original plan was to raise \$25,000, and of this amount \$22,000 has already been subscribed, as follows: Students and faculty of the college, \$13,000; alumni, \$4,000; business men of Manhattan, \$4,000; an Eastern friend, \$1,000. It has been found that \$25,000 is not enough even to complete the building which has been planned, besides it will require some five or six thousand dollars to equip the building after it is completed. It is proposed therefore to raise \$10,000 more. It is necessary to have this amount subscribed in order to let the contract and begin the construction of the building. The lot has already been purchased and the plans of the building have been drawn and everything is ready to construct the building as soon as the money is raised.

We believe that the balance of the sum required, \$10,000, ought to be contributed by the people of the State, a large part of which should come from the farmers of Kansas. You have observed the recent success which has attended the movement in Kansas City to raise \$250,000 for the construction of a Y. M. C. A. building in that city. We should certainly be able to raise \$10,000 from among the farmers of Kansas, since the purpose is to make a place at the Agricultural College which may be a religious home for the farmers' sons who attend this institution.

The Agricultural College is supported entirely by the State and the United States; no individual donates anything for its support. The State, however, contributes nothing toward carrying on religious work or towards the construction of buildings for that purpose. Here is an opportunity for the farmers of Kansas to show their appreciation of the splendid work which the Agricultural College and Experiment Station is doing.

Several of the Kansas farm papers, the KANSAS FARMER, Mail and Breeze, and Farmers' Advocate, have agreed to assist in the canvass in raising this \$10,000, which is still required. These papers have generously started the subscription at a good figure and we hope

that the plan will meet with the approval and a hearty response from the farmers of the State.

Let's see, it will take 10,000 one dollar subscriptions to raise the amount required and I am sure that there are ten thousand farmers who will read this article who are interested a dollar's worth in the Y. M. C. A. work and in the Agricultural College and its development, which interest they can show by contributing toward this Y. M. C. A. building fund. But we expect a great many larger subscriptions. One thousand \$10 subscriptions will

UNDESIRABLE CAMPERS.

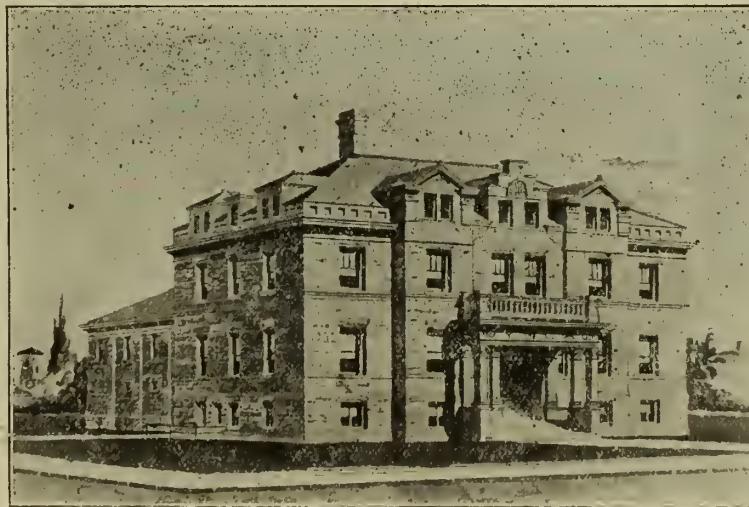

EDITOR KANSAS FARMER:—How long can travelers camp by the public roadside? If there is a time limit, to whom should a complaint be made to induce them to move?

Has the owner of adjoining land any more authority to induce them to move than any one else?

They camp for several days and even weeks at a time. Some of them work while others offer little worthless things for trade for a living, which, with the pitiful stories they tell, amounts to almost the same as begging.

A SUBSCRIBER.

Any one has a right to the unlimited use of the road for purposes of travel. This necessarily includes the right to make such stops as may be incidental to the use of the road in passing to and fro. For all other purposes than its use as a highway, the land included in the road belongs to abutting farms,

Proposed Y. M. C. A. Building, Kansas State Agricultural College.

raise the amount, and it would only take one hundred \$100 subscriptions. I have been informed by farmers in different parts of the State that the suggestions, information, and bulletins received from the Agricultural College and Experiment Station have actually saved for them in one instance more than \$100. I received a personal letter from a farmer in Southern Kansas a few days ago in which he volunteered his financial assistance in any way which would be beneficial to the Agricultural College. I know there are others who will be willing to contribute in this way.

The writer is chairman of the College Y. M. C. A. board of control, and is personally interested in seeing this building proposition succeed. Such a movement ought to receive the hearty support of the farmers of Kansas, and the friends who assist in this movement will receive the appreciation of the agricultural board, faculty, and students, as well as the commendation of all friends of the Agricultural College and the Y. M. C. A. throughout the State.

You may send your subscription to the publisher of this paper, or to W. W. McLean, secretary of the College Y. M. C. A., Manhattan, Kansas. The names of those who contribute to this movement will be published in this paper. Now, do not delay, let us see how quickly we can raise this small amount. It seems that we have raised as much by local subscription as it is possible to raise. Some have proposed trying to raise this amount from wealthy men of Eastern United States, such as Carnegie

(Continued on page 384.)

and if the use of the road as a highway be abandoned, the vacation of the road turns the land back to the adjacent farms and vests in the owners the exclusive right to use the land.

It is reasonable to concede to travelers upon the road the right to camp by the wayside for rest and recuperation on their journeys. It is unreasonable for any to assume that this right extends to the establishment of a domicile upon land loaned to the public for purposes of passage.

In "Kent's Commentaries," Vol. III, pp. 548, 549, occurs the following clear statement of the common law in the case:

"The presumption is that the owners of the land on each side go to the center of the road, and that they have the exclusive right to the soil subject to the right of passage to the public. Being owners of the soil, they have a right to all ordinary remedies for the freehold. They may maintain action of ejectment for encroachments upon the road."

It is difficult to say just how long it is permissible to remain in camp as an incident of passage and, therefore, with right. Remaining beyond a reasonable time the occupant of the road may become an intruder, a trespasser, and subject to ejectment, as stated by Kent. It is to be borne in mind, however, that the court and jury are likely to deal leniently with the intruder in a case of this kind. It will be wiser for "Subscriber" to induce these undesirable neighbors to move on than to resort to the law. The legal remedy suggested by Kent is a civil suit in

ejectment to be brought by the owner of the land upon which the camp is maintained.

ORIGIN OF THE BEEF-TRUST CASES.

President Roosevelt is sending a special message to Congress discussing the several aspects of the meat-trust question.

It will be remembered that this beef-trust investigation followed a showing of injustice made by Guilford Dudley before the Kansas Stock-Breeders' Association in January, 1904. This association passed resolutions on the situation. H. A. Heath, of the KANSAS FARMER, secretary of the Stock-Breeders' Association, forwarded a copy of these resolutions to President Roosevelt accompanying them with a strong letter calling the President's attention to the gravity of the situation.

The resolutions forwarded and the replies which resulted were as follows:

RESOLUTIONS OF THE KANSAS STOCK-BREEDERS.

Whereas, Sufficient evidence has been presented to the stock-breeders of Kansas to convince them that there exists at Kansas City and other points an illegal and unlawful combination or trust that has the power to and does depress the price of beef on foot to the great damage and detriment of the breeders and feeders of Kansas and without a corresponding benefit to the meat-consumers of the world, but to the sole benefit of the packing trust; therefore be it

Resolved, By the Kansas Improved Stock-Breeders' Association, in its fourteenth annual convention assembled, that Theodore Roosevelt, President of the United States, be hereby requested to call the attention of his Attorney General to this matter and require him to investigate the same to the end that the guilty parties may be punished and the anti-trust laws of the United States be fully enforced.

Resolved, That a copy of this resolution be sent direct to the President of the United States, signed by the president and secretary of this, the greatest live-stock breeders' association in the United States.

Whereas, It is apparent that the laws of Kansas are ample for the suppression of trusts and combines and the control of all corporate interests; therefore, be it

Resolved, That we call upon Governor W. J. Bailey to secure the enforcement of these State laws by all means at his command and thus aid in fostering the industries which lie at the foundation of our prosperity and threatening these industries with gradual extinction; and further be it

Resolved, That a copy of this resolution be signed by the president and secretary of the Kansas Improved Stock-Breeders' Association and handed to Governor Bailey.

THE ROOSEVELT WAY.

White House, Washington, January 25, 1904.

My Dear Sir:—I beg to acknowledge the receipt of your letter of the 21st instant, with enclosed copy of resolutions, and to say that the President has taken the matter up with the Attorney-General.

Very truly yours,

W. M. LOEB,
Secretary to the President,
116 W. Sixth Street, Topeka, Kans.

REPLY OF THE ATTORNEY-GENERAL.

Department of Justice,
Washington, D. C.,

January 28, 1904.

Mr. H. A. Heath, Secretary Improved Stock-Breeders' Association, Topeka, Kans.

Sir:—The President has referred to this Department your letter of the 21st instant, enclosing a resolution of the Kansas Improved Stock-Breeders' Association complaining that the anti-trust laws of the United States are being violated by the beef-packing companies to the detriment of the complainants.

In reply, you are informed that in May, 1903, the Federal Government obtained an injunction against the leading beef-packing companies and firms, and also against a large number of individuals, restraining them from violating the provisions of the anti-trust act, and so far as the Department is advised they have obeyed the injunction. If you have any evidence of new violations of the law or of violations of the injunction, forward it to S. H. Bothen, Esquire, United States Attorney, Clea-

THE KANSAS FARMER

go, Illinois, and it will receive prompt consideration.

I enclose a copy of the court's opinion and decree in the beef-trust case.

Respectfully,

P. C. KNOX.
Attorney-General.

Replying to Attorney-General Knox's request for information of violations of the law, Mr. Heath called attention to the fact that in the nature of the case stockmen could possess only clues to evidence, and that they would be unable to present complete and conclusive evidence such as would convict in court. He suggested that with these clues the special agents of the Government ought to be able to perfect the evidence, and that, in the view of the stockmen, competent special agents ought to be assigned to the work.

The Garfield investigation followed, and resulted in a published report which was ridiculed by the press throughout the country.

After accumulating evidence enough to convict the members of the trust and getting the matter fairly into court, the Attorney-General was confronted by the showing that this evidence had been given to Commissioner Garfield under promise of immunity from prosecution. It developed that, under this promise of immunity the members of the trust made haste to confess their guilt. As a crowning piece to this gigantic blunder of the son of a former President, the judge before whom the case was tried strained the law to favor the self-confessed culprits and set them at liberty.

It is not surprising that the President and the Attorney-General are laying before Congress this strong case of outrage in the name of the law with a view of having it made impossible to again thus obstruct the administration of justice. Every member of Congress from the stock-growing States should favor such amendment of the law as will make it impossible for the guilty to escape by confessing his guilt, even to Commissioner Garfield.

INFLUENCE OF THE MOON.

EDITOR KANSAS FARMER:—I would like to know through the columns of the KANSAS FARMER whether it makes any difference in which sign of the moon potatoes are planted in order to secure a good crop.

MATT. WINTERSCHEIDT.

Brown County.

In the fall of 1860 a 15-year-old boy was driving home from town after having delivered a load of wheat at the mill. About three miles from town there was a settlement of thrifty people from Pennsylvania. The women of this community produced vegetables in their gardens, carried them to town in baskets strapped to their backs, and were usually rejoiced on returning with the money they had received for their vegetables. These women never asked to ride on a loaded wagon, but were glad to accept an invitation to ride home when the empty wagon returned. One such mounted the high spring seat on top of the double wagon-box beside the 15-year-old boy above mentioned. She was talkative. Everybody was then speculating on the prospect for war. The following conversation took place:

"What you denk, will be war?"

"Some people think there will, but others think there will be more talk than blood."

"O, our nachbar was to house gesternd abend und he say he see a star und he looks blooty. He denk it is a sign of war. What you denk?"

This energetic woman's husband went to the great war which came soon enough. With her sons she continued to cultivate the farm. They added to the area lands now worth \$100 an acre. Her children went to school. Her grandchildren attended the State University and took honors. Her great-grandchildren are becoming leading citizens.

This good woman was doubtless confirmed in the opinion that the appearance of the planet Mars in the fall of 1860 was a porter of the war of 1861-5. But was it?

This woman who succeeded in producing the finest vegetables believed in planting when "the sign was right," but she neglected not to cultivate and to fertilize. Do her descendants who are equally successful give any attention to signs?

Another instance: A good farmer who rejoiced in the scriptural name, Jephtha, and who was a native of the great State of Ohio, was about to commence haying. Up early in the morning, his eyes naturally scanned the skies to see whether the weather promised fair or foul. The sun rose bright and clear and, after shining a few minutes, went under a cloud.

"No use to think of haying to-day,"

said Jephtha. "I have noticed all my life that if the sun gets up clear and then goes to bed again, it will be a rainy day. It's a sure sign. I never saw it fail."

The boys didn't believe much in signs and decided to keep a record on the "sure sign." It failed that day, and during that haying season "it missed oftener than it hit."

Some of Jephtha's descendants have attained prominence, some have become very wealthy, but not one of them pays any attention to signs, to changes of the moon, or to any of the vagaries which disturbed the repose of mind of their ancestor at planting time, at haying time, and at hog-killing time.

The successful farmer of the present day should be something of a scientist. He should lay aside all sayings and imaginings and depend upon recorded observations as to phenomena of nature. The official records fail to show any advantage from observing signs of the moon, neither do they show any influence upon vegetation on account of positions of the planets.

DIVISION OF INHERITANCE.

EDITOR KANSAS FARMER:—Will you please answer the following question: When both parents have died without making a will and all children are past 21 years of age, is any process of law necessary in dividing property if all can agree to division? A. M. OLSON.

Cloud County.

This correspondent does not state whether the property left by the parents consists entirely of personal property, entirely of real estate, or of both personal property and real estate.

In the division of personal property where the heirs are all of lawful age it is necessary to provide for the payment of all debts that the parents or either of them may have owed at death; to make sure that all heirs are included; and to make the division satisfactory to every heir. There being then no one at interest to complain, the division can be made without assistance of the Probate court, and no lawyer would be needed. If there is any liability that any of the heirs may change his mind and become dissatisfied, it will be well to draw up a paper stating which property is assigned to each heir and that each accepts such division in full satisfaction of his claims against the estate. This agreement, signed by each heir, may be placed in the hands of a disinterested third party, for instance the bank, for safe keeping.

There is probably real estate also to be distributed. In this case the conditions mentioned as incident to the division of personal property have to be observed, and the matter might be settled by mutual consent and without danger of future complications were it certain that none of the holders would ever desire to sell their lands. Purchasers of lands are, wisely, particular to have the official records show perfect succession of title. The record in this case would not show conclusively that all debts had been paid, or that all of the heirs had received their share to which they were entitled. Such lack in the record would "cloud" the title to such an extent as to seriously reduce the value of the holding.

It is in all cases of this kind better to pass the estate through the Probate Court. One of the heirs, perhaps the oldest brother, should ask the Probate Judge to appoint him administrator. The other heirs can signify their acquiescence in the appointment and their agreement as to the division of the property. If there are no debts, or the heirs have provided for the payment of the debts, there need be no heavy expense. If the case were in Shawnee County, the Probate Judge would render all necessary assistance and no lawyer would be required. The entire cost would probably be \$12 to \$15. The records of the Probate Court would then make clear the title to properties and the possibility of future complications would be avoided.

The case is not quite so simple where there are minor heirs, but where all want to do right and all agree there need be no great expense.

Young readers of the KANSAS FARMER of a few years ago were greatly pleased with the "Autobiography of a Collie Dog." They will again be pleased on following the "Autobiography of a Pony" by the same careful writer, a young lady who chooses to have her excellent writings appear first in this paper. After its publication in the KANSAS FARMER, the "Autobiography of a Collie Dog" was issued in book form by a prominent publishing house. Those who enjoy going down into the mental and emotional phases of animal life following the insight of one who

has an unusual intuitive appreciation of their experiences as well as an insight into their relations with people will enjoy the "Autobiography of a Pony," while those who can not, like the young lady who writes these stories, get into close sympathy with animals will surely be benefited by getting as close as they can.

Breeders of pure-bred stock will be interested in the letter of Dr. N. S. Mayo on "The Live Stock Industry of Cuba." The development of the stock industry in the island under the able guidance of Dr. Mayo as Chief of the Department of Animal Husbandry is likely to call for importations of well-bred animals from the United States.

The late snows and early rains of the spring of 1906 have provided in the soil and subsoil of a very large proportion of Kansas as much moisture as is used in growing and maturing a full crop of corn, wheat, or oats. The problem of retaining this moisture where it may contribute to the growth of the crops is one of first importance.

Frank Hall, of Denver, Col., is now on the ocean with 2,100 head of Hereford cattle purchased in Herefordshire, England. The bunch is valued at \$80,000 to \$100,000.

BLOCKS OF TWO.

The regular subscription price of THE KANSAS FARMER is one dollar a year. That it is worth the money is attested by the fact that thousands have for many years been paying the price and found it profitable. But the publishers have determined to make it possible to secure the paper at half price. While the subscription price will remain at one dollar a year, every old subscriber is authorized to send his own renewal for one year and one new subscription for one year, and one dollar to pay for both. In like manner two new subscribers will be entered, both for one year, for one dollar. Address, The Kansas Farmer Company, Topeka, Kans.

VOICE OF THE PEOPLE.

G. A. Biddle, M. D., of Emporia, Kansas, writes: Please find enclosed \$1.00 for which send me THE KANSAS FARMER

You will remember, perhaps, that I stopped my FARMER some time ago, but I feel like there might be something going on that I do not hear of. The reason I stopped the FARMER was that there is too much stuff in it that is absolutely without interest to me and should not interest any one else. I object to filling the paper up with continual stories, but as I am not directing the policy of your paper and find you can still do business even if I do stop my busscription—at least I have not heard of your suspension—I will do like the Hon. Cy Leland in the boss buster business, "If I can't beat em—will jine em." So just send along your paper—stories and all—and I will take down "my kick."

Mr. Kingsley, of Independence, Kansas, writes: "I am sending a new name with my own for the \$1.00 subscription offer. The new subscriber is John P. Wetmore, Independence, Kansas."

"My name must be among the oldest on your list. I know I was taking THE KANSAS FARMER in 1873, and suppose I shall take it as long as I live."

After the Lawbreakers.

EDITOR KANSAS FARMER:—Please allow me to commend THE KANSAS FARMER, not in terms of flattery, but in words of soberness and truth, for the publication of the International Bible lesson entitled "Temperance" by David W. Clark.

I wish I had a clarion voice that could be heard from the Atlantic on the East to the Pacific on the West, and from the Lakes on the North to the Gulf on the South. I would sound it forth until every voter in this broad land of ours could find no rest until he became anxious to do all in his power to abolish the liquor business, root and branch.

I most heartily approve of Governor Hoch's plan to oust the derelict State officers for violating the most sacred obligations that men can take upon themselves in assuming the duties conferred upon them by the laws of the State.

It is certainly too late for the Supreme court to undertake to decide that the plan is unconstitutional. Such a decision at this juncture would be greater complicity with the rum power than was the Dread Scott Decision of ante-bellum times. Cruel as was the enslavement of the African race, it bears no comparison with the shackles that now bind the white race and the

colored people of the United States.

At such a time as this, THE KANSAS FARMER should keep giving its powerful influence in favor of the rigid enforcement of the prohibitory law, urging the Governor to push his plan of ousting every perfumed officer of the State.

If prohibition in Kansas falls flat to the ground, hordes of liquor-mongers will override the State and everything good and noble will be left in heaps of ruins. It must not be.

Mordecal said to Queen Esther not to think that she would escape if she held her peace at that crucial moment. Let all the lovers of sobriety and Christianity be aroused to action and "stand up for Kansas" like men.

Dear Editor do not call me insane for I am duly sober and I am aware that THE KANSAS FARMER has much to do in its legitimate line as an agricultural magazine, but this subject vastly outweighs everything else now touching our interests, and this is my apology for writing this letter. God is with us. Keep marching around Jericho and the walls will fall.

BENJAMIN NICHOLSON.

Sumner County.

Shawnee County Boys' Corn-Growing Contest.

EDITOR KANSAS FARMER:—The committee in charge of the boys' corn-growing contest of Shawnee County met March 31, and offered \$35 in prizes for pure-bred corn raised by boys from 12 to 18 years of age. The money will be divided as follows: \$10 for the best ten ears, \$8 for the second, \$6 for the third, \$4 for the fourth, \$2 for the fifth, and \$1 each for the next five. Leaflets giving full information will be furnished by the committee: F. P. Rude, North Topeka, of Indian Creek Grange; Emery Brobst, of Oak Grange; and C. A. Klein, of Berryton. Pure-bred seed-corn will be furnished at cost to the boys, and can be obtained at Forbes Bros., and of members of the committee. This contest is open to all farmer boys within the age limit. F. P. RUDE, \$53.

Upon reading Luther Burbank's article on "How Plants are Trained to Work for Man," printed in "The Youth's Companion" for March 22, one can not help thinking that only a Methuselah could reap the full rewards of his own plant-breeding. The article indicates that the author has already achieved the end aimed at in some of his experiments. On the other hand, many of them involve so many crosses, such careful selection season after season, that the result of them can hardly be known within the span of three score years and ten. This contribution to "The Youth's Companion" is said to be the first word that Luther Burbank has ever yet said about himself or his work in print, and it is likely, therefore, to be read with interest by every one interested in horticulture.

Agriculture

Some Experience with Barley.

EDITOR KANSAS FARMER:—On account of the high price of shorts and bran, I concluded, in 1902, to try to secure some kind of grain which could be raised on our farms, that had plenty of protein to help balance the corn-ration for all kinds of stock. Speltz was lauded to the skies by the Northern seedsmen. I procured a small quantity and raised some. I was disappointed in it as there were too many husks. In 1903 I sowed 8 acres with six-rowed spring barley on river-bottom land. On May 27 the floods came and the barley, with all our other crops, was washed away. In 1904 I sowed about 8 acres near the river. It grew very fine and was ready to cut before fall wheat, but after it was in the shock, the river rose high enough to float all but about 40 shocks. We saved that for seed and sowed it in 1905. A part of the seed saved was sown on ground where there was some volunteer wheat and was choked out; but we thrashed enough to give it a fair trial and found it far superior when ground, to corn chop and Kafir-corn. Horses could stand the heat a great deal better after eating it; it made excellent slop for hogs when ground fine; and for milch cows, it is far superior to bran and shorts.

In the fall of 1904 I received a bulletin from the McPherson Experiment Station giving the results of the yields of various kinds of grain, and this said that Tennessee winter barley yielded 62½ bushels per acre. I immediately wrote for and obtained one bushel which was sown October 8 on good soil. It came up strong and made a fine growth. It was not damaged by the winter in the least and on June 9 it was cut and shocked. The ground was measured and there was just 89 rods. The crop was thrashed as soon as the wheat was cut and I had 35½ bushels of fine grain. There was considerable loss handling such a small quantity. I think there will be no difficulty in raising from 50 to 80 bushels per acre on our rich bottom-lands. I distributed a little seed to some of my friends and saved the balance. For Kansas farmers and breeders, I believe barley is a bonanza, equaled only by alfalfa.

Dickinson County. WM. RAMSEY.

Seeding a Hog Pasture.

I desire to seed for hog pasture a piece of ground consisting of black creek-bottom land and limestone slope. The latter is underlaid with heavy clay subsoil and in places is somewhat seepy. This land is now in English blue-grass with a little white clover, but the stand is poor. A part is now in pasture and will have hogs on it this summer. I wish to sow this piece in white clover. Can I secure a stand while hogs are on it? The balance of the ground will have no stock on it. I shall use a mixture of Alsike, red, and white clover, with redtop for seepy spots. At what time and in what manner should I do the seeding in order not to destroy the grass already there? I also desire to seed a timber slope which I have thinned and cleared of underbrush. I shall use Kentucky blue-grass and white clover. At what time should I sow?

At what time should rape be sown for hog pasture, and how much seed should be used per acre?

I have a Duroc sow that has farrowed and raised fifty-two pigs in a little less than twenty-four months. This can be beat but how many KANSAS FARMER readers can do it?

Osage County. H. G. JUMPER.

Sow the clover- and grass-seeds on the English blue-grass meadow as soon as possible. In fact it might have been a good plan to have seeded on the late snow. Sow now, however, while the ground is still freezing and thawing, before it becomes packed by rain, and a good part of the clover- and grass-seed will become covered with soil and sprout, or it may be advisable to run the harrow over the field two or three times just as soon as the soil is in fit condition, or immediately after sowing the grass- and clover-seed. With early seeding the harrowing would probably be all the cultivation really necessary, but if you do not seed until after the ground becomes firm then I would advise disking and harrowing in order to loosen the surface to receive the seed. The disking will probably not injure the English blue-grass, and may benefit it.

The field could be pastured lightly with hogs, if they were kept from root-

ing, and I would advise that they be kept off during wet weather when the ground is soft. It will not do to pasture very closely; in fact, it would probably be better not to pasture during the first part of the season.

I would advise also to sow the grass and clover as soon as possible in the timber lot—the earlier the better. Unless you can cultivate the ground to cover the seed, it will not be advisable to sow after the ground becomes settled and firmed by spring rains.

If rape is sown broadcast or in close drills four to five pounds of seed is required per acre, but if planted in rows thirty inches apart two pounds of seed per acre is sufficient, and even less may be planted and give a good stand. On the whole, I think it is preferable to sow in close drills rather than to sow broadcast and give no cultivation after planting.

You may hear from some of the KANSAS FARMER readers regarding the Duroc sow with fifty-two pigs.

A. M. TENNEYCK.

Cheat Instead of English Blue-Grass.

I sowed some grass-seed last fall supposing it was English blue-grass, but to my disappointment it turned out to be cheat. I mixed with this cheat-seed 27 pounds of alfalfa-seed and 35 pounds of Bromus inermis. These three kinds of seed were mixed together and sown on nine acres of land that was plowed early and deep, being well settled before it was seeded. I drilled in the seed with a disk-drill, secured a good stand and thought I would pasture it to keep the cheat from seeding. What treatment would you advise me to give this field in order to secure a better stand of alfalfa? I thought some of disking the ground after harvest and seeding to alfalfa. Would you disk or plow or what would you suggest? There seemed to be considerable alfalfa up last fall.

Washington County. JNO. BROWN.

Unless the Bromus inermis has made a fair stand along with the alfalfa, I would advise you to plow this field and seed down other land to grasses and alfalfa this spring. As a rule it is not satisfactory to attempt to thicken a stand of alfalfa or grasses, and there would be a special objection in this case since the land is seeded with cheat.

If there is a part of a stand of Bromus inermis along with the part of a stand of alfalfa you have mentioned, I would leave the field alone and not attempt to reseed it. I would either pasture off the cheat, as you have suggested, or cut the grass early to keep the cheat from seeding. Bromus inermis will thicken up very rapidly, and a half a stand of grass will often spread so as to give a very good stand the succeeding year. Probably the alfalfa is thick enough to furnish good pasture with a good stand of grass. A. M. TENNEYCK.

Harrowing to Maintain Mulch—Growing Wheat.

Will you kindly give me some information in regard to harrowing wheat? What month would you suggest for harrowing in this section of the country, and how often would you harrow? What kind of harrow would be the best to use? A. A. BEITZER.

Saline County.

We have not carried on extensive experiments in harrowing wheat at this station. For the last three years I have harrowed a field of wheat each spring but have not made a yield test. From observation, there seemed to be little or no effect on the growth or yield of the wheat, but the last three seasons have really been too wet for the best development of wheat. The harrowing is essentially for the purpose of conserving soil-moisture. In a drier season we may expect more beneficial results. I have not observed that the harrowing injured the wheat. Our plan has been to harrow once or twice in the spring after the wheat has started well. It is not usually advisable to harrow wheat in the fall and it is best not to harrow too early in the spring, but when the wheat has made some start and the roots of the plants are well established, wheat may be harrowed without injury and often with much benefit. The harrowing will not only loosen the soil, producing a mulch which tends to conserve the soil-moisture, also producing a favorable surface for receiving rain, but the harrowing destroys the young weeds and gives a cleaner crop of wheat than may be secured without harrowing, especially if the soil is inclined to be weedy.

W. H. Campbell in his "Campbell's Method of Soil Culture," recommends harrowing the wheat, beginning in the spring and continuing the harrowing until the wheat is a foot or eighteen inches high. In the dry climate of the

semi-arid regions, the harrowing and the continuing of the harrowing during the early growth of the wheat may often prove beneficial in conserving soil-moisture and producing larger yields of wheat than may be secured without the cultivation. Mr. Campbell claims excellent results in the use of his method on the Pomeroy farm at Hill City, in Graham County, Kansas. The average yield of wheat on the Pomeroy farm, resulting from the practice of the Campbell method of culture, was something over 40 bushels per acre, while the average yield from surrounding farms was not over 20 bushels per acre. The Campbell system includes much more than the harrowing of the wheat, and I believe that on the Pomeroy farm the practice has been to summer-fallow, practicing summer culture every two or three years, during which season no crop was grown. Experiments in the harrowing of wheat are being undertaken at the Fort Hays Branch Experiment Station, Ellis County, Kansas.

The weed-harrow, or weeder, is perhaps better adapted for harrowing wheat than the common straight-tooth or slanting-tooth harrow. The weeder is somewhat objectionable on account of the wheels. When the ground is reasonably firm the common harrow may be used without injuring the wheat. I question whether it is necessary to continue the harrowing after the wheat covers the ground well, unless very heavy rains firm and puddle the soil, destroying the mulch of mellow earth. Usually this will not occur. I have harrowed wheat when it stood 5 or 6 inches high and had stooped so as to about cover the ground, and the mulch thus produced was still in evidence at harvest time. In this experiment the ground was harrowed twice on the same day. The yield of wheat from the harrowed field was 3 bushels per acre on the average above that from the field adjacent not harrowed, and at harvest time the soil of the harrowed field contained 2 inches more water in the first six feet of soil than that of the field which was not harrowed. The wheat on the harrowed field ripened about two days later than the wheat on the check plot. This experiment was carried on at the North Dakota Experiment Station with spring wheat. It was observed in the same experiment that wheat harrowed before it had stooped much was injured in the stand and gave a less yield of grain than the wheat not harrowed. It appears, therefore, that even with winter wheat there may be some danger of injuring the wheat if it is harrowed too early in the spring. A. M. TENNEYCK.

Sand Lucerne.

Is there a kind of alfalfa-seed that grows and thrives better on light, thin prairie-land than does other kinds? If so, what is the name of the seed and where may we buy a few bushels of it?

Chautauqua County. J. O. TULLOSS.

You perhaps refer to the Turkestan alfalfa. This is a hardy strain of common alfalfa, which has been brought to this country from the dry plains of Turkestan where it has been growing for perhaps a century. Apparently this variety of alfalfa is somewhat harder than the common alfalfa grown here, and may be better adapted for growing in Western Kansas and the Northern part of the United States. Possibly also it may succeed better than common alfalfa on thin land in Southern Kansas. We sowed a plot of it three years ago alongside of a lot of common alfalfa, but the Turkestan alfalfa does not grow so rank and has not yielded quite so well as common alfalfa. The trial was made on our upland soil, land rather poor in fertility. Pure seed of Turkestan alfalfa is hard to secure. The seed is advertised by Western seed companies. We secured seed three years ago from Northrup, King & Co., Minneapolis, Minn., and this company now advertises pure seed of Turkestan alfalfa. You may be able to get a small sample of seed also, from the U. S. Department of Agriculture. Write to T. B. Galiaway, Chief of Bureau of Plant Industry, U. S. Department of Agriculture, Washington, D. C.

It may be that you have in mind land lucerne (*Medicago sativa*). This is a perennial, leguminous plant, resembling alfalfa; in fact, it belongs to the same group or family, the botanical name of alfalfa being *Medicago sativa*. We planted a plot of sand lucerne a year ago last fall; it made an excellent stand and produced several cuttings last year, but the hay is a little coarser and not so good in quality as alfalfa hay, although from analysis of the hay it appears that the feeding value of sand lucerne hay is practically equal to that of alfalfa. Sand lucerne is very highly recommended for

is practicable in Hamilton County, Kansas. In fact, I doubt whether dry-land farming may be successfully carried on in that section of the State without the practice of thorough tillage and cultivation of the soil, as outlined in the "Campbell Soil-Culture Manual." I refer you to Mr. Campbell's soil-culture manual for detailed information regarding his methods. Write to H. W. Campbell, Lincoln, Nebraska. I have mailed to you a copy of a letter which briefly describes the Campbell system of culture.

The durum wheat has been grown successfully at several points in Western Kansas. I met farmers in Thomas County last fall who claim to have harvested 40 bushels of durum wheat per acre last season. In Southwestern Kansas I have also received favorable reports of the growing of this wheat. The durum wheat is doubtless better adapted for growing in our Western climate and soil than any other variety of spring wheat. I find that Western farmers sow the wheat very early in the spring or even in the winter. It should at least be sown early in the spring. I have mailed you copy of a circular letter giving information regarding durum wheat.

I have learned that broom-corn is grown very successfully in the counties east of Hamilton and even in Hamilton County. This crop is a great money-maker. We have published no bulletins at this station regarding the handling and culture of broom-corn, but you can secure excellent bulletins from the United States Department of Agriculture, Washington, D. C.—address Office of Experiment Stations. A good bulletin on durum wheat may also be secured from the South Dakota Experiment Station, Brookings, South Dakota. I have mailed you seed-grain circular No. 1, which calls attention to the best producing varieties which have been grown at this station, at the Ft. Hays Branch Station, and at the U. S. and State cooperative station at McPherson, Kansas.

Other crops adapted for growing in the section named are sorghum and Kafir-corn, sorghum especially being grown for forage and Kafir-corn both for forage and for grain. The difficulty has been to mature Kafir-corn for the grain-crop—we need earlier maturing varieties. Some work is being done in breeding Kafir-corn at the Ft. Hays Branch Station, Hays, Kansas, with the purpose of securing earlier-maturing and better-producing strains or varieties.

Spring barley is grown successfully in many of the Western counties of the State, and alfalfa is being rapidly introduced and is a hardy crop wherever a stand may be successfully established.

I am also urging Western farmers to try the growing of flax more extensively. I see no reason why flax may not become a profitable crop for growing in Western Kansas the same as in Western North and South Dakota.

A. M. TENEYCK.

Boys' Corn-Growing Contest in Wilson County.

EDITOR KANSAS FARMER:—I enclose the circular letter which was mailed to 640 Wilson County boys eligible to the boys' corn contest being organized throughout the State. We have a good entry list at present, including one girl, and there are more coming in.

We could not supply all locations of the county with one variety, so have selected Hiawatha Yellow Dent, Farmers' Interest White, Boone County, White, and Hildreth's Yellow Dent.

All interests are cooperating to make the undertaking a success.

The Wilson County Farmers' Institute reorganized with the following officers: H. E. Bachelder, president; J. E. Thompson, vice president; Walter J. Burtis, secretary, and H. M. Starns, treasurer.

We will report again when the corn is distributed. WALTER J. BURTIS.

Fredonia, Kansas.

Following is the Wilson County circular:

Fredonia, Kans., Feb. 22, 1906.

Dear Sir:—The State of Kansas is being organized for the boys' corn-growing contest for 1906.

Each county is expected to organize independent. Wilson County will be organized by the Wilson County Farmer's Institute, assisted by County Superintendent, G. L. Atkeson. The cooperation of all parents is solicited.

CONDITIONS OF CONTEST.

One quart of pure seed-corn will be furnished without charge to each farmer's boy between the ages of 12 and 18 who will agree to plant it carefully, cultivate it well, and exhibit ten ears of corn raised from that seed at the

County Institute and corn contest to be held next fall.

This Institute and corn contest will be held in Fredonia at the court house sometime between the middle of October and the middle of November. Men of experience will be present and give instruction in judging corn. Each boy will be expected to prepare a brief statement as to date of plowing the ground, kind of land, methods of preparing for planting, method and date of planting, methods of cultivation, date of gathering his samples, statement of number of mature stalks in plot on the first day of August and also the number of barren stalks.

The corn should be planted where it will not readily mix with other corn, but it must not be grown on a city lot.

A medium maturing and a late variety suitable to this locality will be selected by the institute committee and held ready for distribution at the court house Fredonia, Kansas, March 31. Boys who can not come to Fredonia for their sample of corn will notify the secretary of the institute and it will be mailed to them.

Ten prizes are offered for the best ten ears of corn, in order 1st \$10, 2nd \$8, 3rd \$6, 4th \$5, 5th \$4, 6th \$3, 7th \$2, 8th \$1, 9th \$1, 10th \$1. Some special prizes by individuals will be offered to be announced later.

The following entry is to be filled out and mailed at once to the secretary, Walter J. Burtis, Fredonia, Kansas. This is to be an application for seed.

Boys' name.....
Age
Father's or Guardian's name.....
Township
Postoffice

To raise funds for this contest each boy is requested to solicit small subscriptions from his friends, mailing what he can collect to either the State Bank or the Wilson County Bank, Fredonia, Kansas.

This money will be carefully accounted for and if enough is collected the prizes will be increased.

All the winners in the county contests will be eligible to enter the State contest to be held at Manhattan, Kansas, under the management of the State Corn Breeder's Association, January 1 and 2, 1907.

The State prizes will be announced later. For further information, apply to the secretary.

WALTER J. BURTIS, Secretary.
H. E. BACHELDER, President.

Hen's Eggs Wanted.

We've always had the "pie-habit"—now we're coming into the limelight as egg-eaters. Each year 80,000,000 of hungry Yankees want more "hen fruit" than sufficed for the previous year. It's really getting to be quite a serious question how we're going to get 'em fried, poached, and scrambled in quantities sufficient to satisfy us. Supply doesn't seem to keep pace with demand—which fact accounts for the other fact—that lots of times we don't get any eggs at all.

Now, if you travel about the country and keep your eyes open, you will be convinced that there are hens enough in sight to give every man his "two soft" seven mornings in the week, if each hen did her full duty. Which observation brings us square to the point where the "screw is loose"—they don't do it—no fault of the hens, either. The real trouble is, the hen-man doesn't know his business, or else he neglects it. He doesn't treat his hens in the way self-interest would seem to dictate. You can't expect a lot of hens confined in a closed house or yard, with no systematic or rational effort to supply what they would get in a natural state, to make a profit for the owner! Now, if you are planning to make your whole living, or even your "pin money" out of hens, there are two or three things you should certainly remember. First, don't be satisfied with scrub hens. Second (and here is the real point), don't attempt to keep them without giving a regular daily ration of a good tonic. Nothing in hen culture gives so large a return as this one thing, and the only tonic to use is Dr. Hess' Poultry Pan-a-ce-a, prepared by Dr. Hess & Clark, of Ashland, Ohio, and sold by all dealers. This has been the experience of all successful poultrymen. This preparation is not a stimulant, like pepper or something of the kind that excites unnatural production for a time.

Dr. Hess' Poultry Pan-a-ce-a does its work in a different way by assisting the hen to fully digest her food and send each element to its proper part in the hen's economy. Thus a daily feed makes bone, flesh, feathers and eggs, each to the extent of proper elements in the food. Dr. Hess tells us that a Poultry Pan-a-ce-a is a true scientific preparation. It is the result of painstaking experiment in his own yards. So certain are Dr. Hess & Clark of the wonderful value of Poultry Pan-a-ce-a and Instant Louse-Killer, that they cheerfully give a written guarantee that it will do all they say. If it does not you get your money back. Considering cost of ingredients and care taken in manufacture, these goods are remarkably cheap. It costs but a penny a day to feed thirty hens.

One quart of pure seed-corn will be furnished without charge to each farmer's boy between the ages of 12 and 18 who will agree to plant it carefully, cultivate it well, and exhibit ten ears of corn raised from that seed at the

In Actual Use

Keen Kutter Quality tells in the actual use of the tool. Keen Kutter Tools are not retired by an occasional knot or tough piece of material. They are made to stand hard work and lots of it. They are as good as new after poor tools have gone to the scrap heap. The

KEEN KUTTER

brand covers a complete line of tools. In buying any kind of tool just see that the name Keen Kutter is on it and you have assurance of full satisfaction. Keen Kutter Tools have been Standard of America for 36 years and are the best that brains, money and skill can produce.

Some of the kinds of Keen Kutter Tools are: Axes, Hammers, Hatchets, Chisels, Screw Drivers, Auger Bits, Files, Planes, Draw Knives, Saws, Scythes, Timers' Snips, Scissors, Shears, Razors, etc., and Knives of all kinds. If your dealer does not keep Keen Kutter Tools, write us and learn where to get them. Every Keen Kutter Tool is sold under this Mark and Motto:

"The Recollection of Quality Repains Long After the Price is Forgotten."

Trade Mark Registered.

Swine-Feeding for Profit.

R. F. NORTON, SENIOR MEMBER OF FIRM OF B. F. NORTON & SON, BREEDERS OF TOP DUROC-JERSEYS, CLAY CENTER, KANS., BEFORE THE CLAY COUNTY FARMERS' INSTITUTE.

"The feeder builds to his ideal mold; His knowledge is measured out in gold."

The environment and diet of swine have been changed to suit the profit and convenience of man to such an extent that it now pays to have some succulent feed

animal with the least waste of nutrients, but, to be profitable, this combination must be such as not to be too expensive. Now corn and alfalfa, the very products we wish to market through the hog, and the very cheapest and easiest feeds produced on the Kansas farms, luckily make the very best balanced ration that can be had except milk. This leaves nothing more to be said except when and where one or both of these are not available. Having alfalfa and no corn, or high-priced corn, we may supply the grain ration from the wheat by-products or ground Kafir-corn. Bran and alfalfa do not make a balanced ration. They are too much alike in chemical make-up. Shorts or ground Kafir-corn is better. Tankage is not necessary to use with alfalfa for we already have the necessary protein in the alfalfa. Having the corn and no alfalfa (here is the hardest problem), milk is an excellent feed with which to balance, or if not available, then such succulent feed as rape, beets, or sorghum may be fed. I believe I have found no better feed, aside from alfalfa or milk, that does me more good in the feed ration than amber cane, especially for growing stock. And let me say now, I believe it pays and

despite the efforts to the contrary of some of his near relatives, the German plutoocrat, the French autocrat, and others on the other side of the waters, the American hog, the Kansas "mortgage-

food for 100 pounds of gain. Those weighing from 150 to 200 pounds required 480 pounds of food for 100 pounds of gain. Those weighing from 200 to 250 pounds required 498 pounds of food for 100 pounds gain. Those weighing 250 to 300 pounds required 511 pounds of food for 100 pounds of gain, or over 5 to 1. Pigs weighing 300 to 350 pounds took 535 pounds of food to make a gain of 100 pounds. This is one of the reasons why hogs are marketed lighter than formerly.

Here is the result of a feeding experiment of our own on a pig bought in January in Illinois, sired by Tip Top Notcher, champion boar of the World's Fair at St. Louis. (This hog weighed 1,120 pounds at 23 months old.) We fed shorts mixed with milk and one pound of tankage per day. The gain for seven days, ending February 24, was 17 pounds, and for the next week, ending March 3, just before he was six months old, the gain was 16 pounds—33 pounds in fourteen days. Not fat, but just growth. This pig weighed 175 pounds at six months.

Despite the efforts to the contrary of some of his near relatives, the German plutoocrat, the French autocrat, and others on the other side of the waters, the American hog, the Kansas "mortgage-

extent that it seems little short of miraculous that they can be fed at a profit at all. But, to prove such is the case, it is only necessary to look about some farms and see the wonderful transformation in a few years brought about with the profit accrued from "feeding corn to hogs." And when we read the statistics of the business of the meat trust we naturally conclude that if there is no profit in feeding, somebody is woefully fooled.

Time was when people of corn-belts seemed to think all that was necessary to grow and fatten a hog was to give him plenty of corn and water and little if any exercise. But we have learned that although some may have succeeded fairly well by this method on cheap land and cheaper feed, yet it is too risky. Swine can not endure this treatment generation after generation and be profitable to the feeder. They must have exercise, especially during the growing period, and some more succulent food, as well as that with more protein for the building of bone and muscle. Such feeds are meat-meal, with 62½ per cent protein, tankage 60 per cent, oil-meal with 32 per cent, bran and alfalfa hay with 12 to 15 per cent, green alfalfa 5 per cent, as compared with corn with 10 per cent.

The profit of pig-feeding depends upon the cost of the feed used. Therefore, anything that cheapens the feed increases the profit, provided it is not done at the expense of the health of the animal. This calls for a balanced ration. A balanced ration is a combination of feeds that will nurture the

at all times, both for growing stock and fattening. If we depend too much on chemical analysis, however, we would discard all such feeds, but is not so much the actual nutrients we get from them as the balancer. It helps to get the most out of the other feeds and acts as a conditioner. Then if we wish to push the growth, especially of bone and muscle for breeding stock, we should use some feeds rich in protein, such as oil-meal, tankage, or meat-meal.

Now, a "balanced ration" is "all Dutch" to many feeders, so we just say do not depend on corn alone, especially for growing hogs, but give a variety and after that give them all the rape, alfalfa, or some other green or succulent feed, they want and let them balance the ration for themselves, and you can depend upon it, they will do it and do it right.

Now I will give you some facts and figures about feeding cattle and swine. Tests show that for 100 pounds of digestive nutrients consumed, cattle gain 12.7 pounds, sheep 14.3, hogs 29.2.

In a test given by the Wisconsin Experiment Station, it was shown that pigs of 15 to 50 pounds weight consumed 293 pounds of food for 100 pounds of gain, or nearly three pounds of feed for one of gain. In pigs of 50 to 100 pounds weight, 400 pounds of feed were required to make 100 pounds of gain. From 100 to 150 pounds weight, pigs required 437 pounds of

lifter," the "farm rent-payer," the "home-maker," is still doing business at the old stand.

The Live Stock Industry of Cuba.

EDITOR KANSAS FARMER:—My promise to write a short article on this subject for THE KANSAS FARMER has haunted me like Banquo's ghost, so to put it down, I will fulfill my promise.

Cattle.—The cattle industry is by far the most important. With the fine pastures of Guinea and Parana grasses, good water, and a mild climate throughout the year it is bound to increase rapidly. Before the last revolution in 1895, Spanish statistics gave the total number of cattle on the island at 2,500,000. These were practically destroyed during the war only about .06 per cent remaining. The Island is being restocked with cattle very rapidly and at present there are about 2,000,000 cattle and this amount is increasing by about 400,000 head per year. About one-third of this is natural increase, the remainder being imported. About one-third of the cattle imported come from the United States (mostly from Texas and Florida), the other cattle being imported from Columbia, Venezuela, and Mexico.

The greatest plague to the cattle-grower is the ticks. The ticks not only hinder the importation of northern pure-bred cattle for breeding purposes because the ticks inoculate them with the germs of Texas fever, but the greatest damage they do is as parasites sucking the blood of cattle and reducing them in flesh. During the

dry winter season they are very bad and it is necessary to bathe or dip the cattle to destroy the ticks.

Screw worms are also very common and it is necessary to watch wounds on all animals to keep them free from this parasite. Little attention has been paid in the past to improving the native cattle and the old method of free breeding is extensively practiced at present, but this is giving place to the selection of the best native bulls, and a goodly number of Hereford, Shorthorn, Aberdeen-Angus, and a few Holstein bulls have been imported. The demand is for short-haired cattle with large horns, the latter being important as they fasten in the ox yoke to the horns.

Horses.—Outside of the cities, the horses are of a small Spanish type and are used exclusively for saddle and pack animals. They are practically all naturally saddle gaited and take a running walk that will cover five or six miles an hour. They are hardy animals and will keep the gait all day.

In the cities are a good many American driving-horses and many American mules, the latter being used for carting. General farmwork is done with oxen, although the use of mules for farmwork is gradually increasing. The drawback to using mules for farmwork is the difficulty of getting satisfactory drivers.

Swine.—The breeding of swine seems to be one of the most profitable branches of the live stock industry. The native hogs are of the "razorback" type and get their living in the woods. The countryman takes his dogs and with a small sack of corn slung over his shoulder rides through the forests and brush, frequently cutting his way with his machete, a stout sword that they invariably carry. The dogs are large, fierce fellows that range through the dense brush and when they find any hogs they begin to hark. The hogs do not run away but gather in a bunch for protection. When the owner hears the dogs barking, he rides to the place, calls off the dogs, scatters a few handfuls of corn for the pigs and continues the hunt.

In some parts of the island are many native dogs that have run wild. These wild dogs catch some small pigs but as a rule the sows and boars successfully defend the pigs. The principal food of the hogs is the seeds of the royal palm, which are very rich, but the pork produced is oily.

We are trying some interesting experiments in crossing native sows with pure-bred Berkshire and Tamworth boars.

Sheep.—There are a few large, hairy sheep in the island but they are of little importance as there is little demand for mutton.

Goats.—There are a large number of milch goats kept in the cities and towns. They are the poor man's cows. Some of them give between three and four quarts of milk daily. The best of the milch goats are said to come from the Canary Islands. The common method of using goat's milk is to boil and burn the milk and then salt it before using.

Poultry.—Chickens are high, usually selling from 50 to 80 cents Spanish silver (\$1 American money buying from \$1.15 to \$1.40 Spanish silver). Eggs are usually worth 4 to 5 cents each Spanish silver. It would seem as if the poultry-business would be very profitable but there are many drawbacks in the shape of diseases and parasites. A number of Americans have tried the poultry-business on a large scale and have failed. Our Brown Leghorns and Black Minorcas have given excellent returns.

In glancing over this article it reminds me of a Spanish stew, in that it contains a little of everything. If you don't like the stew as a whole, you may be able to pick out some bits that will "pass muster."

N. S. MAYO.

The Veterinarian

We cordially invite our readers to consult us when they desire information in regard to sick or lame animals, and thus assist us in making this Department one of the most interesting features of The Kansas Farmer. Kindly give the age, color, and sex of the animal, stating symptoms accurately, and how long standing, and what treatment, if any, has been resorted to. All replies through this column are free. In order to receive a prompt reply all letters for this Department should give the inquirer's postoffice, should be signed with full name and should be addressed to the Veterinary Department of The Kansas Farmer, Topeka, Kan., or to Dr. C. L. Barnes, Veterinary Department, Kansas State Agricultural College, Manhattan, Kan.

In addition to having this letter answered in The Kansas Farmer, an immediate answer is desired by mail, kindly enclose a 2-cent stamp. Write across top of letter: "To be answered in Kansas Farmer."

Paralysis in Duroc-Jersey sow.—I have a Duroc-Jersey sow twenty months of age that has been down for two months. She seems to be in good

It Pays to Feed DR HESS STOCK FOOD

(TONIC)

It pays because it increases digestion and prevents many forms of stock disease. Stock in ordinary condition only assimilate about 50% of the food eaten, and it is safe to estimate that 2/3 of this 50% of food digested is used to repair waste, leaving but a small amount of food to produce the profit. As it is the food digested and assimilated, above what is required to sustain life, repair waste, etc., that produces the profit, stockmen are naturally interested in increasing the digestion. Suppose you are feeding a profitable ration and your animals are thriving, if you can increase the digestive capacity of the animals from 50 to 60 or 75%, this amount of additional increase all goes to produce profit, as none of it is required for the "Food of Support." Dr. Hess Stock Food is guaranteed to increase the bone, muscle, and milk-producing value of the food sufficient to pay for itself many times over, besides curing and preventing stock disease. It is for stock of all kinds and in all conditions.

DR HESS STOCK FOOD

(TONIC)

is the prescription of Dr. Hess (M. D., D. V. S.), containing tonics for the digestion, iron for the blood, nitrates to expel poisonous materials from the system, laxatives to regulate the bowels. It has the recommendation of the Veterinary Colleges, the Farm Papers, is recognized as a medicinal tonic and laxative by our own Government, and is sold on a written guarantee at

5c. per pound in 100 lb. sacks; 25 lb. pail, \$1.60

(Except in Canada and extreme West and South.)

A tablespoonful per day for the average horse. Less than a penny a day for horse, cow or steer. If your dealer cannot supply you, we will. Remember, that from the 1st to the 10th of each month Dr. Hess will furnish veterinary advice and prescriptions free if you will mention this paper, state what stock you have, also what stock food you have fed, and enclose two cents for reply. In every package of Dr. Hess Stock Food there is a little yellow card that entitles you to this free service at any time.

Dr. Hess Stock Book free, if you will mention this paper, state how much stock you have and what kind of stock food you have used.

DR. HESS & CLARK, ASHLAND, OHIO.

Also manufacturers of Dr. Hess Poultry Panacea and Instant Louse Killer.

INSTANT LOUSE KILLER KILLS LICE.

health; eats and drinks well, and sits up, but is unable to control hind parts. I thought it might be kidney trouble and applied turpentine, but this did not help her. What is the trouble and how shall I treat it?

F. A.
Maple Hill, Kans.

Answer.—I fear your animal is paralyzed in the back to such an extent that it will be unsatisfactory to treat her. I fear that she has received some injury that is deep-seated, affecting the nerve supply to the limbs, and in that event it would not be possible to affect a cure.

Crude Black Oil for Lice.—Will crude black oil do to use on hogs to kill lice, applying around ears, back, and legs?

B. E. M.
Wellington, Kans.

Answer.—Yes, the crude black oil can be used on your pigs. The only objection is that it may be too strong and cause considerable irritation.

Soft Lumps on Stifle Joints.—I have an 8-months-old dun-colored horse colt, that has a large lump of a soft flabby nature over or in front of each stifle joint. These swellings were there when the colt was foaled in June, but did not seem to hurt him in any way until in December. He seems to be stiff in both hind legs and steps mincingly. The veterinarian here called it an excess of joint water and prescribed an acid liniment of some kind to be rubbed on every 3 days; also says he has never seen a similar case in his 38 years of practice. His treatment has been followed for ten weeks with no improvement. Can you tell me what the trouble is and prescribe a cure?

E. S.
Lousburg, Kans.

Answer.—From the description you give of the colt's condition the flabby swellings over the stifle being there since the animal was foaled, I question whether you will be able to effect a complete cure. You might try the following liniment: Four ounces of tincture of iodine, 2 ounces oil of turpentine, 2 ounces of tincture of cantharides, 1 pint of compound soap-liniment. Mix and shake well before using; rub into affected parts daily.

Sore on Gelding's Leg.—My 5-year-old dark bay gelding has a festering sore on right hind leg, that discharges bloody water. Have used copperas, blood-root, given salts internally, and rubbed on some liniment that took the hair off. What is the trouble and what shall I do for it?

C. C. L. S.
St. John, Kans.

Answer.—For the sore on the animal's leg would suggest that you use the following dusting powder daily: One ounce of Iodoform, 2 ounces of acetanilid, 1 1/2 ounce of tannic acid, 1 ounce of boracic acid.

ONE MINUTE STOCK DIP
LIVE STOCK INSURANCE
The cheapest insurance you can get is a DISEASE PREVENTIVE. Don't wait to cure disease—keep it away from your live stock. You can do it with Dipolene, which kills all disease germs, sheep ticks, scab, lice, fleas and all body vermin. Perfectly harmless. Promotes health—sprinkled about barns and lots keeps them sanitary, wards off disease. Write for FREE book, "DIPPING FOR DOLLARS," MARSHALL OIL CO., Box 13, Marshalltown, Iowa.

SIGHT RESTORED FREE 80 PAGE BOOK
TELLS HOW TO CURE YOURSELF
of Blindness, Falling Sights, Catarracts, Granulated Eyes, Weak, Unrested or Bare Eyes, Tears, Runny and all other Eye Diseases at your own home as thousands of others have done. Book tells all about eye diseases, has colored pictures showing diseased eyes. Tell all symptoms of eye diseases. Cure falls eye test chart. Tells how to test eyes. Tells how to care for eyes and many other interesting facts. Sent free in all-well today. Address DR. W. O. COFFEE, 872 Century Bldg., Des Moines, Iowa.

header that should please the most exacting. The others are by Imp. Mariner, Flora's Chief and Godoy Butterly, all of the right kind in breeding and individual merit and the female part of the offering throughout are the same high quality. It is not too late to get a catalogue. If you address H. E. Bachelder, secretary, Fredonia, Kansas, and mention THE KANSAS FARMER, the same will be sent at once. Arrange to attend the sale.

Frank Iams of "Peaches and Cream"
Fame, not a "Dreamer of Dreams,"
But a Man Who "Does Things."

Mr. Johnson:—"Give my regards to Broadway," tell all the stallion buyers of Frank Iams, St. Paul, Nebr., the largest individual owner and importer of Percherons, Belgians and coach stallions. "The home of the winners" is a nut cracker. Iams is showing all competitors the race of their life. He is doing the business. Selling the stallions while his competitors are "knocking." Iams is not a dreamer of dreams but a man who "does things." He has the goods you read about. He makes every statement good. He has opened up a new barn of his noted prize winners, 80 top notchers, they must all be sold. These are Iams' famous "Peaches and Cream" stallions, that he is selling at \$1000 to \$1500 (few higher). Guaranteed better than any stallion sold to Farmers Co.'s" at \$3000 to \$5000. Iams "barrel of luck and push" makes him a "mascot" to buyers. He is saving thousands of dollars to buyers. He hypnotizes you with lusty black boys at let live prices. If you will visit him and do not say this is true, you get this \$100 cheerfully. Iams gives a breeding guarantee of 60 per cent, pays freight of horse and buyers fare. You say, why can Iams sell these State prize-winners and sons of winners so cheap? Iams is an up-to-date business man of 24 years' practical experience in importing and breeding horses at St. Paul, Nebr. He buys stallions by special train loads, he uses his own money, owns his farms, barns and horses; has no two to ten men as partners to divide profits with. Iams speaks the languages, this saves 20 per cent on each stallion. Iams is not in the great stallion trust, (runs his own business and has all competitors fighting him), because he sells all of his stallions at his home barns, employs no buyer or con salesman to sell you a \$1200 stallion for \$3000. Iams saves you all commissions and middle-man's profits, and sells stallions that are so good that they do not need to be peddled be sold. Here is the milk in the coanat.

Our illustration on page 374 is Iar Prusant-De Louroux (29344) Royal Belgian black boy, 4 years old, weight 2210 pounds. He is a big, massive, wide-as-a-wagon drafter with a leg under each corner. A smooth ever proportioned "black boy" with plenty of scale and finish. He stands on the best of feet and has 14-inch bone. He is a real cholly boy on dress parade. He makes all the Tony girls wink their eyes and say that is one of Iams' "Peaches and Cream" black boys that we read about. He has the goods and makes good his ad, and gives his customers a square deal. Write for greatest horse catalogue on earth. It will tell you how to save \$1000 and buy a first-class stallion. It's a business fetcher. Iams is the man behind the gun and is saving thousands of dollars to stallion buyers.

The Heath Shorthorn Sale.

In this issue will be found the announcement of the seventh annual sale of Shorthorn cattle from the Heath ranch, two miles south of Republican City, Neb. The sale is on April 4, Wednesday, and will consist of some thirty head or more of young cows, heifers, and bulls from this, one of the oldest established herds in Southwestern Nebraska and one of the best consignments ever offered. Nearly one-half of the offering is good, strong, lusty young bulls, from ten months old up. The young cows and heifers are nice young, well-bred animals, from a milking strain of cows, by well-bred sires, such as the straight-bred Scotch bull Lancaster Royal 168270 by Imp. Prince Oderic etc. Golden Victor, Jr., 175464. While the latter bull is the sire of most of the offering, the cows old enough to breed are in calf to Lancaster Royal. Several are by Aberdeen Lad 154974, one of the grand herd bulls. In this sale are three fine Double Standard Polled Durham bulls that are bred along good dairy lines.

Besides the cattle, there will be sold a lot of high-grade Percheron horses and several teams of work-horses and bred Poland-China gilts, farm implements, and other utensils, thus making it a very important sale. The catalogue is out and will be sent on application. Send for it and come to the sale and it will be a day well spent, whether you buy or not.

A Great Shorthorn Sale.

On Saturday, May 5, Darling Bros., of Coshocton County, Ohio, will sell about two car loads of registered Shorthorn cattle at Mankato, Kansas. Darling Bros. are proprietors of the famous Evergreen stock-farm and among the best known breeders of the East. Their herd consists of the best blood found in the country. Many of their animals have never been defeated in the show ring. They have won ribbons at the State fairs of Ohio, Kentucky, West Virginia and at the great exposition at Charlestown, South Carolina.

They inform us that this consignment will consist of about 25 head of bulls from one to two years old and that any one of them is good enough to be a herd-header. If you will write Cliff Darling, at Randall, Kansas, he will send you a catalogue of the consignment.

Gossip About Stock.

Col. C. M. Crews, the Topeka auctioneer so well known to stock men throughout the State, has been engaged by the Department of the Interior as auctioneer of the sale of certain town lots for the Osage Town Site Commiss-

sion and the first sale of the town site of Foraker on May 1.

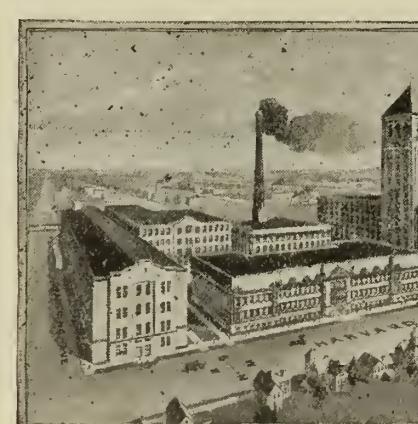

R. H. Weir, Oberlin, Kansas, proprietor of the Decatur County herd of Poland-Chinas, has an advertisement in this paper offering some fall boars for sale. These are good animals and well worth the money he asks for them. If you need an animal of this kind, kindly write him mentioning that you saw his advertisement in THE KANSAS FARMER.

In the dispersion sale of the H. R. Little herd of Shorthorn cattle at Hope, Kansas, April 26, 1906, will be the opportunity of the season to secure either heifers sired by or cows bred to the great bull, the Rustler, one of the best bred and best breeding bulls ever placed at the head of a Western herd. He is one of Robbins' breeding out of the dam of Ruberta and by the Lad For Me and the calves and yearlings in the sale of offering are typical show animals proving him worthy of his great ancestry and bespeaking for him a new home in another of the best herds of the West. In the young animals of his get are those of either sex, that our readers who are looking for material to strengthen their show herds should look after. Send for catalogue at once and kindly mention THE KANSAS FARMER.

In this issue on another page is the announcement of an important combination sale of choice Hereford cattle, at Superior, Neb., on Wednesday, April 18, 1906. It is made up from a choice selection of forty head of which one-half is young serviceable bulls. The cows and heifers old enough to breed will be safe in calf, or have calf at side. The sale is made up from consignments from such well-known herds as W. N. Rogers, McCook, Hatfield and Son, McCook, Neb., P. M. Morse, Beaver City, Neb., W. R. Wonderly, Invale, Neb., and R. N. Lewis, Bladen, Neb. There are no better whiteface cattle in the West than is found in these old established herds and those desiring to add new blood to their herds, will have a good opportunity to get it at this sale. There will also be show cattle and herd-headers for those desiring that kind of stock. The breeding is given in the sale catalogue, which will be sent on application to W. N. Rogers, McCook, Neb., under whose management the sale is conducted.

A Modern Commercial Marvel.

In 1895, when its founders laid the foundation upon which has since been erected the Seers, Roebuck & Company towering structure of business, believed the time opportune to go to the purchasing public of America with a proposition to supply them with the best the world's markets afford at a price which did not represent a series of profits to innumerable middlemen. They believed that the public could be well served by an institution which would bring to them the product of field and factory at a price so low that it represented but the bare cost of production, plus one small percentage of profit. This meant the elimination of the jobber, the wholesaler, the traveling salesman, the general and special agents—these cumbersome and expensive adjuncts to business which make it necessary for the consumer to pay, in most cases double the first cost of the merchandise he uses.

On this foundation of right prices has been built a superstructure into which was placed much material that is new. They sought to find the best merchandise that the markets of the world afford, and finding it, then endeavored to place it within the reach of every individual. They also taught the business world and incidentally the buying public, that the old hackneyed phrase, "Satisfaction or your money back," is not a meaningless phrase when incorporated in their literature, but that it is a sincere declaration, and that the customer can do them no greater favor than to return that which is unsatisfactory, and permit the firm to return his money and reimburse him for such expenses as have been involved in the transaction.

These fundamental principles won for Sears, Roebuck & Co. instantaneous recognition, and the growth of the business has been one of the wonders of the commercial world. The first quarters were quickly outgrown, larger quarters soon became inadequate, and since 1895 they have been moving about from place to place as the exigencies of business compelled them to seek larger quarters and better facilities for handling the business which came to them. Finally, they purchased a large building in downtown Chicago, but it was soon necessary to duplicate the structure. Still they grew, and they began leasing adjacent buildings until the business had spread to a number of the largest buildings and warehouses in Chicago. Early in 1904 they realized that this institution was growing more rapidly than they could care for it and that an entirely new plant, with every modern facility that science could devise must be provided. In the

center of a populous residence district on the west side of Chicago they acquired forty acres of ground, and on December 31, 1904, began the erection of the largest commercial institution in the world.

To provide an adequate merchandise building it was found necessary to build a structure so large that they were compelled to ask the City Council of Chicago to close certain streets so that they might build over them. This privilege was promptly accorded. They found that no such shipping room as was necessary to take care of the enormous and rapidly expanding business had ever been provided for any commercial institution. In length, breadth, and height this merchandise building would be so large that the method of conveying merchandise to the several departments, and in turn getting the several items comprising a customer's order from the several floors to the shipping room, involved difficult problems which had never before been solved. Then, too, it was found no inconsiderable difficulty to prosecute the work of construction on this enormous plant and to move from the numerous buildings downtown without interruption of business, without bringing disappointment to customers. This has all been accomplished in less than a year's time.

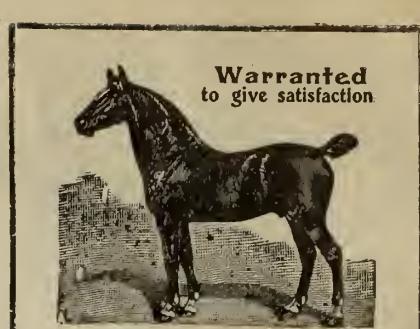

The first shovelful of dirt was thrown on the December 3, 1904, and the first department moved into its new quarters on September 1, 1905, just eight months later.

The problem of what would give the proper foundations proved a most perplexing one, as it was found to be over 60 feet to rock. Finally, it was decided to use concrete caissons, and under the walls of the Merchandise Building they have 1,506 caissons, 4 feet or more in diameter, and from 20 to 60 feet deep. In building these caissons 65,000 cubic yards of concrete were used. In all the buildings, which are of brick and terra cotta construction, they consumed 28,000,000 brick, 25,000 barrels of lime, 130,000 barrels of cement, 15,000,000 feet of lumber and 12,800,000 pounds of steel and iron. The merchandise building alone, which is almost a quarter of a mile long, a block wide, and nine stories high, is equivalent to 308 ordinary large store buildings.

An index to the building feats accomplished in the erection of this plant may be gathered from the fact that Annex "A" of the Merchandise building, erected on an area of 79,450 square feet was completed in 30 days. Here are some further figures that will doubtless prove very interesting. The entire plant is heated from a central station, and they used, in installing the heating apparatus, 100 miles of pipe; to convey the electric current for lighting the plant and operating its machinery 4,400 miles of copper wire, weighing 400,000 pounds, were used; for the distribution of filtered heated air in the winter time, and filtered cool air in the summer, 10 miles of sheet metal pipe.

The buildings are five in number, each designed for a special purpose.

This necessarily brief and fragmentary description of the several buildings comprising this new merchandising establishment will give some idea of the immense proportions to which this institution has grown in a period of 11 years, and it will also indicate what they have accomplished in the way of building and equipping a giant mercantile establishment in one year's time. It is a splendid monument to the sagacity of the American people, to

GOMBALT'S CAUSTIC BALSAM

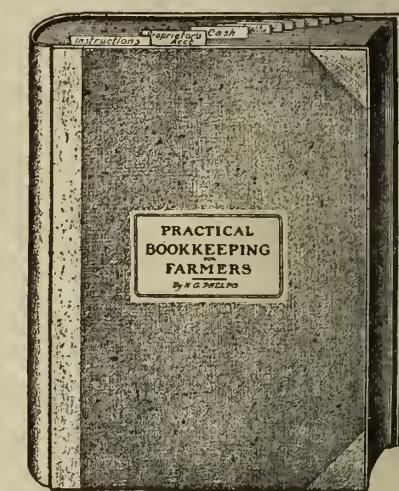

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all bunches from Horses or Cattle.

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.

Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price \$1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE LAWRENCE-WILLIAMS COMPANY, Cleveland, Ohio

The farmer's guide to success in farming, 200 pages 10x13 inches. 20 pages of instructions and illustrations. A full set of farm accounts worked out. The remainder of the book for use in keeping accounts. The results of a whole year's business are shown on one page which will show the farmer the cause of success or failure. Will last the average farmer three years. Price \$3.00. For a short introductory period the price will be \$2.00 delivered. Descriptive circular and testimonials free.

Send us ten 2-cent stamps and we will mail you our latest book—a 50-page book on Business Writing and Lettering; or we will send you both books for \$2.15, regular price \$4.00.

ings need coating every year. The best thing to do with these roofs is to rip them off altogether and lay Amatite. This roofing needs no coating at all, whether it be new or old. After it is laid (and that is an easy job), you need never to think about your roof for years to come. Amatite samples can be secured for examination free by addressing the Barrett Manufacturing Company, New York, Chicago, Cleveland, Boston, Allegheny, St. Louis, Minneapolis, Philadelphia, New Orleans, Kansas City.

About Oregon.

The remarkable growth of the great State of Oregon is well indicated by the increase in the yearly production of the fruits, grains, and grasses, and other agricultural products for which this State is so justly noted.

Oregon possesses some of the richest and most productive, and cheapest lands in the Union and it is indeed, "a land of promise" for those desiring homes in a country of almost perpetual spring and where land is sold within the means of every homeseeker desiring to acquire a competence.

The great attractions of this State are amply set forth in a beautiful and well-prepared booklet of 88 pages, entitled, "Oregon, Washington, and Idaho and Their Resources," which is sent out by General Passenger Agent A. L. Craig, to all inquirers interested in the resources of this great State. The beautiful illustrations in this booklet and explicit statements of profits made by farmers along the lines of the Oregon Railroad and Navigation Co., and the general subject matter thereof will be of deepest interest to every one contemplating making their homes in the mild climate of the Pacific Northwest.

The splendid wheat-producing country of the Palouse region, Washington, and the Walla Walla, Pendleton, and Umatilla sections of the State of Oregon, and the apple, orange, and peach lands of the Hood River Valley all receive a detailed description in this booklet. This book is sent out free, it only being necessary to enclose four cents in stamps to help pay the postage. We recommend every one reading this article to send for this publication without delay.

Those of our readers who are interested in pure-bred poultry will be glad to receive the fourth annual poultry catalogue of E. E. Vannatta, Vandalia, Mo. Such an interesting booklet helps to promote and increase the sales of pure-bred birds and Mr. Vannatta is to be commended for his enterprise in this respect.

A California trip is made doubly pleasant if it includes a daylight ride over the Rockies. This is the way of the Colorado Midland. Colonists' rates in effect daily February 15 to April 7. For full information write Morell Law, traveling passenger agent, 566 Sheldene Bldg., Kansas City, Mo., or C. H. Speers, G. P. A., Denver, Colo.

Very Low Rates Tuesdays.

Every Tuesday, balance of the year, the Chicago Great Western Railway will sell homeseekers' tickets to Minnesota, North Dakota, and Canadian Northwest at about half rate; to other territory first and third Tuesdays. Write G. W. Lincoln, G. P. A., 7 West 9th St., Kansas City, Mo. State number in party and when going.

Powderpaint in 1906.

The painting season will soon be on. There will be lots of repainting of old buildings in addition to the new ones that will be erected. Any suggestions as to where good paint may be had at a reduced price will be timely. The argument for Powderpaint set forth in another column is deserving of consideration. This is a paint without oil, a compound prepared by A. L. Rice, of Adams, N. Y., which is giving very general satisfaction. The first great claim in favor of Powderpaint is that it is so much cheaper than oil-paints. It comes in powder form and requires only to be stirred in cold water, saving as much as three-fourths of the cost. In appearance and in lasting qualities it is claimed to be not inferior to oil-paints. It is said to be even better in many cases owing to the counterfeiting and impositions practiced in mixing many oil-paints. Powderpaint has the same sort of "set" that Portland Cement has. It forms a sort of enamel coating which does not crack or powder and which is weather proof, a resistor of colds and gases and to a remarkable extent of even fire. Certainly no more pleasing effect can be produced with the high-priced oil-paints than with this new painting material. It is having a large sale for farm-buildings, both outside and inside, barns, poultry-houses, and sheep-houses, etc. All particulars may be had by writing directly to Mr. Rice, North street, Adams, N. Y., for the little book on his new painting process, which he will send free of charge.

A magnificent steel engraving of Hagerman Pass, the most famous mountain pass in Colorado, has been issued by the Colorado Midland Railway. This engraving is 26 by 40 inches and suitable for framing. It will be sent to any address on receipt of 15 cents in stamps by Morell Law, traveling passenger agent, 566 Sheldene Bldg., Kansas City, Mo., or C. H. Speers, G. P. A., Denver, Colo.

To those seeking homes, no better inducement is offered than in Jewell County, Kansas. It is one of the leading counties in the State, and statistics

THE WAY TO GET READY FOR HARVEST

If you grow grain or grass of any kind, you are invited to call on any dealer who sells one of the *International Line of Harvesting and Haying Machines* and get one of the new 1906 catalogs. You will find it well worth your while, for it's full of good grain sense—harvesting talk that means *bigger profits* for you.

While you are there, take a few minutes and look at one of the harvesting machines itself.

You will find that it comes up in every way to what your ideal of a *good* harvesting machine ought to be.

It is *convenient*—easy on you and easy on your horses—because it embodies every labor-saving, draft-reducing device that the most expert mechanical skill of the past 50 years has produced.

It has *large capacity*. There is no wasted energy about it. It allows you to do the work of harvesting "in a hurry."

It is *dependable* because it is made right. The materials used in it—the steel, iron and lumber—are the products of the manufacturer's own mines and mills and are right in every particular. There is no "guess work" about them. They are tested before used.

It is an *economical* machine because it saves all your grain; it saves time; it saves labor; it saves repair bills; it saves worry and trouble.

If a machine is *right* in its design, *right* in the materials used in its construction, *right* in its workmanship—it comes pretty nearly meeting every requirement you can make of it.

Convenient—trustworthy—economical. What more can you ask of a harvesting machine?

This question of harvesting means much to you. A half day's delay may make the difference between profit and loss on your crop.

The grain a poor machine or a worn-out machine *wastes*, is just so much from your profit.

It's too late now to reduce the *cost* of growing the crop—too late to *increase* the yield—your only chance is to get it *all* in the harvesting and to get it at the least expense of time and money.

If you grow grain, you need a *good* harvester.

If you grow hay, you need good haying machines.

It is economy to get the *best* you can find. International dealers have them.

Champion	Milwaukee
Deering	Osborne

If you don't know him, write to us for his name and address.

International Harvester Company of America, Chicago

(Incorporated)

INTERNATIONAL LINE.

Binders, Reapers, Headers, Header-Binders, Corn-Binders, Corn-Shoakers, Corn-Pickers, Huskers and Shredders, Corn Shellers, Mowers, Hay Tedders, Hay Rakes, Sweep Rakes, Hay Loaders, Hay Stackers, Hay Balers, Knife Grinders, Gasoline Engines, Pumping Jacks, Manure Spreaders, Weber Wagons, Columbus Wagons, Bettendorf Wagons and Binder Twine.

Remember:

There's a good old proverb about the impossibility of making a silk purse from a sow's ear.

It is equally impossible to make a good machine from *poor* materials—or unsuitable materials.

And likewise impossible to make a good machine even from *good* materials, without proper skill and proper facilities.

Every farmer knows how much harder it is today to get good lumber than it was 20 years ago.

Every manufacturer knows how difficult it is to get other materials of exactly the right kind at exactly the right time.

It was to overcome these difficulties that the several manufacturers of the various machines comprising the International Line, co-operated with each other in producing their own raw materials.

They cut and saw their own lumber, in their own

forests; they dry it in their own kilns, and they have it ready when they need it.

They mine their own iron and coal; they make their own coke and steel, and they produce much of the other materials used in their factories.

The result is that they do not have to try "to make a silk purse from a sow's ear." They have the *proper materials* at hand, when they need them.

Nor is that all. The International Line of machines for harvesting and haying embrace only machines which have stood the test of time and bear the stamp of approval of the American farmer.

Consequently there is always a good demand for them, and this demand makes possible the employment, in their manufacture, of the most expert workmen and the best facilities that the mechanical genius of the world has produced.

It is these things that make the International machines so satisfactory to the user.

show that land is lower in that country than in any other when we compare the soil and farming conditions with those of other countries. Prices of land range from \$25 to \$30 per acre, which if in other countries, would command 50 per cent more. If you desire to buy a good home it would pay you to write Morris & Woolsey, of Randall, Kans., who handle Jewell County farms and they will answer any inquiries. Mention the KANSAS FARMER and ask for a list of land which they have for sale.

Barbed Wire Fences.

The man who uses ordinary soap for shaving will soon find out how a horse feels when he gets mixed up with a barbed-wire fence. You can buy a new horse but you can not buy a new face, no matter how irritated or blotchy it gets or how badly it itches. Avoid

laundry or toilet soap for shaving, as you would a barbed-wire fence. Williams' Shaving Soap is made especially for shaving and in another column of this paper is an offer of a free trial sample if you write them and inclose a 2-cent stamp. "For the sake of your face, try it."

The annual sale of Glifford's Short-horn cattle is an event that is always looked forward to by the fraternity with considerable interest. The twenty-second annual sale will be held in the sale pavilion, at Manhattan, Kans., on April 26, 1906, and as usual the offering will be an attractive one, comprising 20 extra good red Scotch-topped bulls from 12 to 20 months old, all in

fine condition, the lot of Red Gauntlet 3d 147509, a Crickshank bull of exceptional quality. The female contingent comprises 20 of the best cows and helpers ever offered from the Glifford herd. All are bred to Scotch bulls, Senator Bruce 226244 and Cordelia's Knight 161501 (the best son of Red Knight). The herd bull, Cordelia's Knight, will also be included in this sale. He is sound and all right and a great breeder. For catalogue address F. M. Glifford, Wakefield, Kans.

Paper gloves and stockings are now made. When finished they closely resemble wool in appearance.

Production and Care of Home-Grown Seed.

READ BEFORE MANHATTAN GRANGE, NO. 748
BY J. W. HARTLEY.

It is not always practical and convenient for farmers to produce and care for the seeds used on their farms. But great benefit will be derived if they endeavor to produce and care for the principal seeds they expect to plant; those on which they rely the most for their support and income such as corn, wheat, oats, alfalfa, and a few others.

In this fertile land of ours we have neglected the production and care of seed, depending mostly upon the fertility of our land, favorable growing seasons, and the small amount of cultivation that we are wont to give our crops for our returns. It is only during the last few years that the farmer has begun to look seriously toward the kinds of seed that he is going to plant on his farm. Pedigreed seed or thoroughbred seed was not thought of by him then. Breeders of live stock are far ahead of the breeders of plants. We think sometimes, when we look upon a fine horse or a fine cow, that the breeders of live stock have reached the acme of perfection. But when we hear of an ear of corn being valued at \$100 and a pint of wheat of a certain variety being valued at \$50, we are forced to believe that the plant-breeders are making rapid strides toward perfecting their products and will soon be abreast of their friends, the stock-breeders, who have had hundreds of years the start.

We are now living in an age of plant improvement and perfection. Colleges, experiment stations, and the Government are showing and teaching the farmers the great benefits to be derived from the use of good seeds on their farms. They are showing them that seed that has been well-bred, well-grown, carefully selected, properly cured and tested for vitality is a tremendous factor in the production of a profitable yield.

The farmer has not always the fertility in his land that he would like to have. He can not always have the rains come and the sun to shine when his crops most need them, nor can he always cultivate when he should. Hence some forces of nature are beyond his reach. Consequently, it is to his advantage to direct those forces of nature that are placed under his power. And the "production and care of the seed" that he expects to plant is one of the forces of nature that he can turn to his advantage, and one which is a prime factor in the successful raising of good crops.

PRODUCTION OF SEED.

To tell the best methods of producing different kinds of seeds would be a task beyond my power and an impediment to your present happiness. But in producing seed we must remember that the seed we obtain contains certain characteristics derived from two parent plants—the mother plant from which the seed is obtained and the father plant which furnishes the pollen. Of course, in the plant world the same plant can and often does perform the functions of both sexes, but by experiments it has been found that where cross-fertilization is employed, the seed resulting therefrom is of greater vitality and produces a better progeny than does the seed from self-fertilized plants. But the physical characteristics of most of our farm plants, having as they do, the reproductive organs so complicated and so intricate make it impracticable for the farmer

to get seed from plants that have been cross-fertilized. Consequently, he has to look for his ideal characteristics in the mother plant from which he selects his seed. This is where the breeder of live stock has the advantage over the breeder of plants. But in a plant like our Indian corn the farmer can get seed from plants that have been cross-fertilized, and it will pay any farmer to have a seed-patch of corn where he can select seed from plants so treated. Send for a bushel of thoroughbred seed-corn. Get it as near your home as possible, as corn that will yield well at a distance might not yield well on your farm. Corn must become acclimated or accustomed to its environments before it will do its proper duty in returning wealth to its owner. Select from this bushel twenty of the best ears. Next number the ears, one, two, three, etc., in order of their proximity to the ideal. Do not plant kernels from the tips of the ears as they do not produce well. Make twenty rows and plant one ear in each row. Have your seed-patch some distance away from any other variety of corn. Cultivate well; shallow cultivation is the best. Just before the tassels are ready to distribute their pollen, go through the patch and cut off all the tassels on the inferior plants in the even rows. This will leave the best plants in the even rows to fertilize the silks on the plants in the odd rows. From these odd rows select your seed for your next year's crop.

SELECTION OF SEEDS.

The farmer should always select his seed when he has the most seed to select from. This of course will be in the fall of the year. Do not wait until your bins are nearly empty for if you do the cows, pigs, chickens, or something else will have devoured some of your choicest seed, and thus lowered the quantity as well as the quality of your next year's crop. Have ideals of each variety in your mind and select such seed as approaches in likeness these ideals. If this method is followed year after year, our crops will not grow less. I have heard farmers say that they must make a change in their seed as they have been growing the same varieties for years on the same land. They claim that such methods will cause the land to "run out" or fail to produce well. Such is not the case. It is the lack of attention to seed-selection that has caused the deterioration and not the continued growing of the same varieties on their farms. If proper care is taken in the selection of seed, farmers need never change their seed. If they do change their seeds, let them be sure and secure it from one that gives yearly attention to the principles of proper seed-selection.

CARE OF SEEDS.

After the seeds have been properly grown and selected, another very important part is to preserve their vitality. Within each seed is a tiny bit of life waiting for proper conditions and surroundings to make it a full-grown plant bearing the golden harvest for the farmer. By a little injudicious care of our seeds during the winter, we can weaken or destroy that little bit of life stored up in them so as to greatly reduce our crops. The object, then, in the care of seed is to preserve the vitality of life-force stored up in each grain of seed so that when it is placed in the ground in the spring this bit of life will bound forth with great strength and rapidity, able to battle with the unfavorable conditions that are likely to overtake it, and thus yield to its preserver a bountiful crop.

To preserve, then, the vitality and strength of each embryo plant stored away in each seed is to keep each seed dry and away from extremes of heat and cold. Any means that secures a thorough drying of seed soon after it ripens and keeps it dry until the seed is planted will be a success. After the seeds have been dried in the fall, place them in such a manner that a free circulation of dry air can get to them. Do not place seeds where there is a great excess of moisture. The seeds absorb moisture and this weakens their vitality and also greatly reduces their power to withstand freezing weather. Freezing weather will not damage seeds much if they are perfectly dry. Do not place your seeds in a loft over stock as the moisture from the animals will be absorbed by the seed. Seed-corn should be left in ear-form until time to plant. Place the ears so they will not touch each other in a pigeon-box arrangement so that air can reach all the ears. Place seed-potatoes on slats a few feet from the ground and not too many in a place. If left on the ground, they absorb moisture and put forth sprouts which reduces their vitality.

AND AMATITE SPELLS SATISFACTION

If you want a ready roofing that will last for years without painting or coating, buy Amatite. If, on the other hand, you want something that will "do" for a time Amatite won't interest you. It is too good. It will last too long for a man who wants a temporary roofing.

Amatite is made to wear.

It is strong, tough, and durable with a protective mineral surface such as no other Ready Roofing can offer.

Its strength lies in the toughness of the materials which go into its make-up—real wool-felt and coal tar pitch—the best water resisting materials known.

Pitch is used in water-proofing all the big buildings, tunnels and subways throughout the country. Recently the old New York Central tunnel was uncovered and some pitch which had been in use for over thirty years was unearthed and the engineers in charge of the work found it just as

pliable and water resisting as the day it was put in.

When you buy Amatite you are sure of getting a roof that will keep out the water—Pitch is absolutely impervious to water.

We are so sure of the superiority of Amatite over any other ready roofing that we are anxious that you should see a sample which you can submit to any test you like. We are certain that Amatite will give better service for a longer period, at less cost, than any other ready roofing made.

You may not be in need of a new roof at the present time, but we would like to have you know about Amatite, so that you will not need to investigate the roofing question when the need of a new roof arrives. Write to-day for the free sample to the Barrett Manufacturing Co., at New York, Chicago, Cleveland, Boston, Allegheny, St. Louis, Minneapolis, Philadelphia, New Orleans, or Kansas Kansas City.

RAILROADS IN CONTEST OVER EXCURSION RATES.

Three Groups of Lines at War as Result of Homeseekers' Rates to Different Sections of the Country.

The three groups of railroads representing the Northwest, the Southeast, and the Southwest are engaged in a three-cornered war over homeseekers' excursions.

Fuel was added to the flames yesterday by a proposition which the Rock Island submitted to make homeseekers' rates effective to the Southwest territory every Tuesday in the month. If the plan is negatived by the Western Passenger Association lines, independent action will be taken by the Rock Island. John Sebastian, speaking for the latter road yesterday, said:

"The Rock Island and Frisco systems stand flatly for the development of the Southwest, into which territory a heavy immigration has been induced by spending a large amount of money and by liberality which has had immense results in the way of colonizing. We believe the location of settlers is vastly more important than the loss of a few dollars through the manipulation of cheap rate tickets. The lines I represent have no objection to any basis of homeseekers' rates which may be inaugurated into other territories, but so far as the Southwest is concerned we shall insist upon protecting that territory by as liberal inducements as are offered by the lines in any other territory."

TROUBLE OF LONG STANDING.

The trouble which has grown serious, had its origin several years ago when the Rock Island and other lines began to make low rates in the interest of developing the Southwest. For years the Western roads had accepted tenders of low rates made by the Southeastern roads with a view to colonizing the South and Southeast. When the Western lines tendered low rates in the interest of their territory, the Southeastern roads demurred and have ever since been calling for a conference.

Such a conference was held in St. Louis last week, at which the Southeastern interests asked the Southwest roads to take out their low rates, applying from Memphis territory. Objection was especially made to the round-trip rate of 75 per cent of the one-way fare which is put into effect during the fall months. All roads except the Rock Island expressed a willingness to raise the rates.

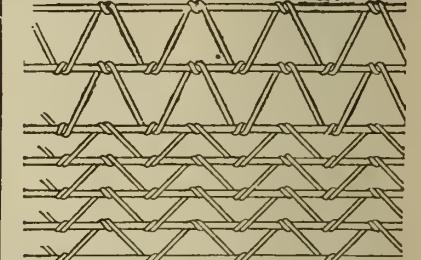

In the meantime the Northwestern lines had given notice that they would run homeseekers' excursions every Tuesday in the month instead of every third Tuesday, and the Rock Island declared it would not permit the Southwest to be sidetracked for any other territory. It is rumored the Rock Island's next move will be to extend its cheap rates to the Birmingham territory, which it has refrained from doing hitherto in consideration of the Southeastern situation.—Chicago Record-Herald.

Second thoughts, they say, are best. —Dryden.

Scandalous gossip is destroying the masses.

THE FIRST

Hartman Stockade Woven Wire Fence

Ever built was erected 17 years ago and is still in use as durable and strong as when first put up. The Hartman is a perfectly woven wire fence that is strong enough to keep in the maddest bull and fine enough to keep out the chickens. It is made of the best quality galvanized steel wire and contains much more material than fences more cheaply constructed. That's why it lasts so long. If your dealer doesn't handle it, write for catalogue and prices. Address

GLEN MFG. CO., 145 MILL ST., ELLWOOD CITY, PA.

Also Mfrs. Hartman Steel Pleated Fence, Hartman Flexible Wire Mats and Glen Steel Mat.

Two Years Test

You don't want to make a mistake when you buy a buggy. We arrange matters so you can be sure you are right. We have our own factory and make what we sell. We will ship you this buggy or any other vehicle you may select from our catalog on

30 Days Free Trial Freight Prepaid

Then if you can find any flaw in it within two years we will replace it free and make you satisfied. Are we fair? We couldn't do this if we were selling other people's goods. And we couldn't do it unless our own were of highest quality. Don't forget, our prices are just about half dealers' prices. Send for catalog showing all styles, and see for yourself. Address Dept. D.

The Apex Mfg. Co., Bloomington, Ill.

Miscellany

Two Kinds of Click-Beetles and Their Wire-Worms.

ELBERT S. TUCKER, MUSEUM ASSISTANT IN SYSTEMATIC ENTOMOLOGY, UNIVERSITY OF KANSAS, LAWRENCE.

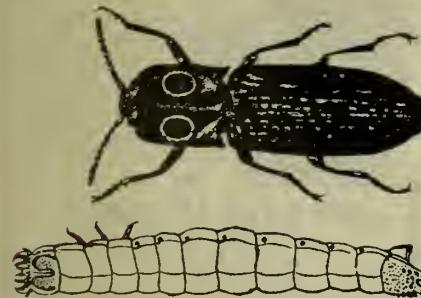

A specimen of the Eyed Elater, (*Alaus oculatus*, Linnaeus), was received with each of the following letters, both of which are brief, yet indicative of the curiosity with which this species of insect is generally regarded. The localities and dates as given add to our knowledge of its appearance in Kansas in a most definite manner.

"I send you to-day a creature the like of which I never saw before." Lola, Kansas, May 25, 1905.

The second letter was addressed to Professor F. H. Snow:

"I mail you a peculiar bug which I found on my water bucket. I have never seen any like it before. Can you inform me what it is—the common name, I mean—and what it lives on? It is of such a peculiar shape and its big eyes make it look so mournful. I feel quite interested." Arkansas City, Kansas, July 15, 1905.

This insect is one of the clicking-, snapping- or spring-beetles which are classed in a family called Elatridæs. More than 500 kinds of these beetles are known in the United States alone.

Eyed Elater (*Alaus oculatus*, Lin.) and larva, (Natural size.) After Harris.

Many of them are familiar to most people and especially to boys under the name of "skip-jacks," though their larvae are better known as "wire-worms." The adult Eyed Elater derives its name, both common and scientific, from two large eye-like spots on its thorax. The place for the real eyes, however, is on each side of the head as with other insects.

To the person who beholds the insect for the first time, its unusual form together with the ornamental eye-like spots are apt to induce startling as well as mistaken impressions regarding it. Its structure is also remarkable by reason of the stout curved prong extending backward on the under side between the joints of the thorax, and with which the insect is enabled to snap itself violently. Still in this respect, it is like all the other members of its family.

It is not often found, but is well known to entomologists. In fact, many kinds of common insects are liable to be considered as strange if not rare creatures by persons who have never seen or known of such before. I can distinctly remember finding my first specimen of this kind of beetle, when, as a boy living in Pennsylvania, I had just begun to collect insects. My astonishment on beholding it was somewhat mingled with fear, but I finally mustered up enough courage to capture it, and it was esteemed as a prize for many years.

I am not aware that this insect has been found farther west than in Texas, Kansas, and Minnesota. The University collection contains Kansas specimens from Neosho as well as Douglas County, myself having taken it here in Lawrence, in June. In the first list of Kansas Coleoptera, furnished by Professor E. A. Poponoe in 1876 and printed in volume 5 of the Kansas Academy of Science, this species was reported as occurring in "Eastern and Middle Kansas."

All that need be said further about this insect is comprised in a popular account written by the eminent authority, William Saunders, in his work on "Insects Injurious to Fruits," from which the figures and description given herewith are borrowed with kind permission of the publishers, J. B. Lippincott Co., of Philadelphia, Pa.

"This is the largest of our Elaters, or spring-beetles, and is found with its larva in the decaying wood of old apple-trees. The beetle (see figure), is an inch and a half or more in length, of a black color sprinkled with numerous whitish dots. The thorax is about one-third the length of the body, and

is powdered with whitish atoms or scales; the wing-cases are ridged with longitudinal lines, and the under side of the body and legs thickly powdered with white. It is found in the perfect state in June and July.

"The mature larva (see figure), which attains its full growth early in April, is about two and a half inches long, nearly four-tenths of an inch across about the middle, tapering slightly towards each extremity. The head is broad, brownish, and rough above; the jaws very strong, curved, and pointed; the terminal segment of the body blackish, roughened with small pointed tubercles, with a deep semicircular notch at the end, and armed at the sides with small teeth, the two hindermost of which are long, forked, and curved upwards like hooks; under this hinder segment is a large fleshy foot, furnished behind with little claws, and around the sides with short spines; it has six true legs—a pair under each of the first three segments. Early in spring the larva casts its skin and becomes a pupa, and in due time there emerges from it a perfect beetle.

"This beetle, when placed upon its back on a flat surface, has the power of springing suddenly into the air, and, while moving, turns its body, thus recovering its natural position. This unusual movement combines with its curious prominent eye-like spots to make it a constant source of wonder and interest. Since it feeds mainly on decaying wood, it scarcely deserves to be classed with destructive insects; yet, being occasionally found in the trunk of the apple-tree, it is worthy of mention here."

Much of the success of fruit-culture depends upon effective contest with insect pests wherever fruit is grown. The enforcement of proper remedial treatment against the greater number of the various kinds of injurious insects has become an established practice towards insuring most profitable yields, either of fruit or other crops. Prompt action is sometimes necessary to save fruit-trees or other fruit-bearing plants from sudden outbreaks of a destructive foe, while at any time, the interests of the fruit-grower require that he should know about the important enemies liable to be encountered, and also the practical methods for their control when possible. The importance of having reliable information at hand as a guide to direct one in recognition of an enemy and what to do to suppress it is readily perceived. Such a guide may prove of incalculable value to a person in need, particularly in times of emergencies. Erroneous advice if followed is most costly than absolute neglect, for, not only is labor then lost, but needless expense incurred.

Mr. Saunders wrote his book, "Insects Injurious to Fruits," after an experience of over twenty years as a fruit-grower in connection with his entomological work, all of which shows how well qualified he was to produce a work that has long held an enviable reputation for standard authority, and the second edition, lately offered, indicates that it is meeting with widely extended sales. The plan of the book consists in treating of the important pests of each kind of fruit under separate headings, according to what they attack and whether injuring the fruit itself, or the roots, body, leaves, buds, or flowers of the plant. Facility is thus afforded to a person, unacquainted with the name or classification of an insect pest, to find reference to it by merely knowing its habits. For instance, when the fruit-grower wants to learn about a certain pest, he turns to those pages of the book which are devoted to a discussion of the enemies of the particular fruit or its plant that is attacked, and therefore him are the figures and descriptions that enable him to identify his specimens in ordinary cases with ease. With this much gained, the desired information is assured. The entire work covers 266 subjects and is illustrated with 440 excellent woodcuts which represent natural enemies—the beneficial insects—together with various stages of the injurious hosts, thereby rendering a very valuable aid towards a more intelligent understanding of the reading matter.

(This book can be ordered through THE KANSAS FARMER. Price, \$2.00.

The fact has been brought out that such trees as afford suitable breeding places for the Eyed Elater are those having rotten portions in which the worms live, consequently, healthy trees would not be subject to its invasions. Actual damage from wire-worms, then, is caused by other kinds which injure crop plants. The following account of one of the more common kinds is here reproduced from a University leaf-

let, copies of which were formerly prepared for distribution by Professor V. L. Kellogg:

THE COMMON WIRE-WORM OR CLICK-BEETLE.
(*Melanotus communis* Gyll.; Order, Coleoptera).

Diagnosis.—A long, slender grub of yellowish-white or light-brown color and unusually hard body, feeding on the roots of cereal and garden plants.

Description and Life-history.—The worms or larvae vary much in size, being, when full grown, from four-fifths of an inch to an inch and a quarter in length. They are sub-cylindrical in form, nearly smooth, shining, and with the head, thoracic, and last segments considerably darker than the rest of the body. The duration of the larval stage is at least three years. The change from larva to pupa usually occurs in July, and the adult beetle issues about one month after pupation. The adult, which is one of the click- or snapping-beetles, is rather slender, dark brown, glossy, and is about one-half an inch long. The body is clothed with fine, short, grayish hairs. The eggs are probably laid in the spring or summer, but the exact time of egg-laying is not known.

Remedies.—For this species and other species of wire-worms no practical remedy against the larva is known. The attention must be given to the adult insects, the beetles. These may be trapped in large numbers on baits of poisoned clover or of poisoned, sweetened corn-meal dough. A handful of freshly-cut clover may be dipped into a mixture of water and Paris green and placed on the ground where the beetles abound. The clover should be covered with a small board to prevent drying. The dough is made by mixing one part of sugar with ten parts of corn-meal, and sufficient Paris green to make a dough.

Fall plowing is excellent for killing the adult beetles which have not yet come from the little earthen cases made by the larva just before pupation.

Quick Carriage Painting.

The following is from a lady: "We have a general-purpose carriage which can not be idle long enough for regular carriage painting, and still it is in need of paint. What can I put on that will dry and harden quickly, and still protect for a time? How will linseed oil, boiled or unboiled, do with coloring matter, or will it require white lead. And can we use the same paint on wood-work and on iron?" For regular painting a coat of lead and oil should be put on first, with a little color in it. Then if you wanted a black finish, a coat of good black paint should be used. But black does not wear long unless covered. There is no body to lamp black. So one or more coats of varnish are put over the black.

This varnish dries hard and will wear, if it is of good quality. Lead and oil, colored, will not wear like varnish, and it will not dry quickly and hard enough for your purpose. At any rate you can do better. Buy some good carriage paint, ground in No. 1 coach varnish, of the color you desire. It comes in cans of various sizes, pints, quarts, etc., and any color you wish. Perhaps a quart will be enough to put one good heavy coat on your carriage. But I do not know just how much wood-work there may be on it. This paint will have a body to it and varnish in it instead of oil. It will dry quicker and harder and look and wear better than oil-paint would. Get a fine varnish brush to put it on with. The temperature of air, carriage, and varnish should not be less than 75 degrees for some hours before you do the painting. It will be better if it is 80 degrees, or more. The paint will go on easier and you can do a better job. You will need to work fast and use some care to prevent streaks and running. A coat of first-class paint of this kind will wear quite a while and the carriage can be used in a day or two, if necessary. Wash it in cold water before using. Avoid dust and mud at first as much as you can. If you get any on rinse off promptly with cold water, but don't rub it. With a little care at first your carriage will look quite well for some time. If you can not get chose paint of the color you desire, and ground in No. 1 varnish of your dealer, Montgomery Ward & Co., Chicago, will send it to you for about 50 cents a quart. A good prepared paint of this kind, mixed by machinery by experts, will do better than you can make from varnish, lead, and color—T. B. Terry in Practical Farmer

A man of pleasure is a man of pains. Young.

Thoroughness is mastered by few.

PAINS

AMERICAN WOMEN FIND RELIEF

The Case of Miss Irene Crosby Is One of Thousands of Cures made by Lydia E. Pinkham's Vegetable Compound.

How many women realize that it is not the plan of nature that women should suffer so severely.

Miss Irene Crosby

Thousands of American women, however, have found relief from all monthly suffering by taking Lydia E. Pinkham's Vegetable Compound, as it is the most thorough female regulator known to medical science. It cures the condition which causes so much discomfort and robes these periods of their terrors.

Miss Irene Crosby, of 313 Charlton Street, East Savannah, Ga., writes:

"Lydia E. Pinkham's Vegetable Compound is a true friend to woman. It has been of great benefit to me, curing me of irregular and painful periods when everything else had failed, and I gladly recommend it to other suffering women."

Women who are troubled with painful or irregular periods, backache, bloating (or flatulence), displacement of organs, inflammation or ulceration, that "bearing-down" feeling, dizziness, faintness, indigestion, nervous prostration or the blues, should take immediate action to ward off the serious consequences, and be restored to perfect health and strength by taking Lydia E. Pinkham's Vegetable Compound, and then write to Mrs. Pinkham, Lynn, Mass., for further free advice. She is daughter-in-law of Lydia E. Pinkham and for twenty-five years has been advising women free of charge. Thousands have been cured by so doing.

Every Heart-Ache

Every pain in the breast, difficult breathing, palpitation, fluttering or dizzy spell means that your heart is straining itself in its effort to keep in motion. This is dangerous.

Some sudden strain from over-exertion or excitement will completely exhaust the nerves, or rupture the walls or arteries of the heart, and it will stop.

Relieve this terrible strain at once with Dr. Miles' Heart Cure. It invigorates and strengthens the heart nerves and muscles, stimulates the heart action, and relieves the pain and misery.

Take no chances; make your heart strong and vigorous with Dr. Miles' Heart Cure.

"I suffered terribly with heart disease. I have been treated by different physicians for my trouble without results. I went to a physician in Memphis, who claimed that I had dropsy of the heart. He put the X-ray on me, and in connection with his medicine he came near making a finish of me. Some time before this a Mr. Young, of St. Louis, was in our town. He saw my condition, and recommended Dr. Miles' Heart Cure to me. I gave it little attention until my return from Memphis, when I concluded to try it, and am pleased to say three bottles cured me."

CHARLES GOODRICH,

Caruthersville, Mo.

Dr. Miles' Heart Cure is sold by your druggist, who will guarantee that the first bottle will benefit, if it fails he will refund your money.

Miles Medical Co., Elkhart, Ind.

CONDUCTED BY RUTH COWGILL.

Ministries.

The memory of a kindly word
For long gone by,
The fragrance of a fading flower
Sent lovingly;
The gleaming of a sudden smile
Or sudden tear;
The warmer pressure of the hand
The tone of cheer;
The hush that means, "I can not speak
But I have heard;"
The note that only bears a verse
From God's own Word—
Such tiny things we hardly count
As ministry,
The givers deeming they have shown
Scant sympathy;
But when the heart is overwrought,
Oh, who can tell
The power of such tiny things
To make it well.

Amos R. Wells.

Training for Domestic Life.

M. W.

With other innovations of modern times, the care of the household and other domestic problems have taken on a dignity that has heretofore been lacking. This is evinced partly by the fact that the subject is worth discussing at all, and partly by the term under which all problems of this kind are classed. Until recently the subject has been so neglected that there was not even a name for it; but now the term "Household Economics" is frequently heard abroad in the land in one or another of its frequently discussed phases. Better still, "Domestic Science" seems a singularly appropriate and fitting term, classing it, as it does, with the other branches of knowledge which are plainly and indisputably worth studying.

THE SCIENCE OF MANY SCIENCES.

There is one striking difference, however, to be noticed. While each of the sciences has a special field for its operation, one who is versed in domestic science must have accurate and useful knowledge of many other branches. For under this head we consider all questions relating to the care and management of the household, the general atmosphere, home comfort, the decorations, the care of the family, the management of the help, and the cooking. To be thoroughly capable, therefore, of competing with the daily problems arising from these varied interests, it is evident that the ideal housekeeper should be thoroughly conversant with many subjects, for instance, the laws of chemistry, in preparing healthful foods; of physiology and hygiene, in sustaining health; of natural philosophy, in judging temperature and heat. Besides all this, the ideal housewife should have more graces of mind and character than are allotted to any other human being, to meet the trials and vexations so constantly arising to trouble her.

"LIGHT HOUSEHOLD TASKS."

Till within recent years, the system of household economy has been left to its own devices, to its own developments. There have been households and households since the beginning of time, but the management thereof has been left to the intuition or natural capabilities of the housewife, for good or ill, as the case might be. This subject was not considered worthy of the weighty discussion which was often lavished on trivial and, if we may suggest it, less important matters. On the one hand, the common fallacy, seemed to be that this was just woman's work, and therefore was simple and easy, requiring no brains or thought. Ignorance on this subject still prevails. How often we have come across the expression, "Light household tasks," which seems to be the poet's favorite delineation of a housewife's duties. The minds of the initiated travel back to their own experience therein, sweeping, dusting, baking, scrubbing, ironing, cooking—"light household tasks," forsooth!

HOUSEKEEPING NOT INSTINCT.

On the other hand, it was generally conceded that if a woman encountered difficulties in her work, her intuition would help her in any emergency. We are inclined to scoff at this idea, for woman would be a most remarkable creature if she were endowed by nature with the knowledge that she needs, which might include: How to cook an appetizing meal from which her lord and master will not contract dyspepsia; how to manage the fresh air and control the temperature so as not to give the babies cold; how to take care of unexpected company gracefully and graciously; in fact, how to run the house smoothly and keep victoriously

above all its petty vexations. Would not woman, indeed, be a most glorious creation if she knew these things instinctively? It is a fact, sad to relate, but alas! too true, that many women have no instinct whatever for home-making, but this seems in no wise to deter them from taking the responsibility of a household upon their shoulders whenever opportunity offers.

THE HOMEKEEPER'S RESPONSIBILITY.

Nineteenth and twentieth century reformers have found here a wide field for operation, and in spite of some opposition and some lack of interest great strides have been made in this comparatively new domain. It is generally understood that a great many evils in our land may be traced directly to badly-managed and poorly-kept homes. What of the poor working man who is attracted by the brightly-lighted saloon as he contrasts it with his own dingy home? What of the clerks who almost faint from exhaustion because of the lack of nutritious food? Think of the hundreds of men holding subordinate positions and doing inefficient work, perhaps for the very same reason. Think of the great mortality of infants and children, due very largely to the mothers' ignorance of the laws of health.

As to the importance of this subject, then, there are no two opinions. We agree that it is the foundation of our civilization, our happiness, and our business prosperity. When we consider the comforts of home, the relaxation from business cares, the training of the children, the food that we eat, can we measure what potent factors they are in shaping the tastes, the ambitions, and the career of each member of the family?

IMPORTANCE OF DOMESTIC TRAINING.

As for similar evils due to ignorance, the remedy has been found in education. Not education in the generally accepted sense only, but in addition the training that will fit this particular need. We would almost say "instead," rather than "in addition," if necessary. We should call it quite absurd for a young man intending to be a doctor to pass through the general college course in sciences and classics, and then put up his shingle and be ready to practice. His patients would perhaps be slow in trusting themselves to his care. A minister must not only have a general education, but he must know his own profession, not by intuition or natural capability, but through study and training. A man can not be a successful carpenter because he is well educated. He needs training and practice in his business before we would trust our houses to him. We would not give our dresses to a dressmaker with neither training nor experience. Nay, verily! Not even though she be a graduate of Vassar! But the lives of thousands of children and the welfare of hundreds of homes are entrusted to the management of women who have no aptitude for this vocation, no training whatever, and no knowledge except that which they gain slowly by bitter experience.

BEGIN WITH THE CHILDREN.

Since fully one-third of the women of our country marry, why should the training necessary for them in their life work be entirely neglected? A great step in advance has been made by the introduction of manual training into our public schools. As in the case of other innovations, this idea has gained ground slowly, partly, perhaps, from the fact that the school curriculum seemed already crowded. And indeed, with the children taking special lessons in drawing, paper cutting, bugs, and butterflies, clay modeling, water colors, beadwork, and raffia, where was the time, after a little had been given to reading and arithmetic and the other branches that used to be considered important, for work in sewing and lessons in tidiness and housekeeping?

But it has been decided that there are things more important for the average child to know than these interesting, but superfluous items, and that perhaps time spent in training eye and hand and brain in the lines of future usefulness may be of practical benefit. The experiment is at least worth trying. So the boys are learning to plan and draw and carve, and the girls are learning to sew and cook, and we wonder why this was not thought of long ago so that many generations of boys and girls might have had this training.

When using baking powder it is always economy to buy the Royal. Royal makes the finest, most wholesome and delicious food.

Who knows what might have been the improvement by this time in the homes of this land of ours?

And so, I say that women should not be willing to take up the duties which will come in home life, without some preparation. It is surely an important vocation, since the health and happiness of the whole family depend upon it. When our girls decide that they will not take the responsibility of a house and the cares of a family upon their shoulders without studying and being trained in household duties and the care of children, there will surely be much less discontent, greater comfort, and even better chances for health and prosperity for every member of the family.

Uses for Stale Bread.

New Boston Brown Bread.—Many a frugal New England housewife, who knows that to "waste not is to want not," never allows one bit of stale bread to be thrown away, and she is able to use many pieces in new Boston brown bread. Soak one and one-half cupfuls of stale bread in two cupfuls of cold water over night. In the morning run through a colander; add three-fourths of a cupful of molasses, one and one-half cupfuls each of rye-meal, granulated corn-meal, and Graham flour, mixed and sifted with three teaspoonfuls of soda, and one and one-half teaspoonfuls of salt, and one and one-fourth cupfuls of cold water. Stir until well mixed and steam in the same manner as Boston brown bread.

Bread Crumbs.—Cut bread in moderately thick slices; place in a pan in the oven and let stay until thoroughly dry (not brown). When crisp, remove from the oven and crush in an ordinary meat-grinder; place in glass jars and set away for use. These crumbs if thoroughly dried keep indefinitely. Bread-crumbs may replace cracker-crumb in almost every instance. They may be used for all scalloped dishes, for frying oysters, croquettes, etc., for use in soups instead of thickening, and if mixed with melted butter and browned may be used for garnishing vegetables and meats.

Fritters.—Stale bread, ground or soaked in milk, makes delicious fritters. Use milk enough to soften the bread in addition to two eggs beaten light and a little salt; then add enough flour to make it the right thickness to stick together, and fry in hot butter or other fat. Eat with syrup or beef or chicken gravy.

By an unfortunate transposition of the poetry quoted in Mrs. Kellogg's excellent paper on "The Right One" in last week's KANSAS FARMER, much of the beauty of the thought was obscured and she was made to appear to be an egotist whereas she is exactly the reverse, never overvaluing her own merits and always generous to others of whom she thinks, speaks, or writes. Those who have retained their KANSAS FARMER of March 29 should turn to page 348 and reread Mrs. Kellogg's paper reversing the positions of the quotations.

Natural history always interests children, who usually recall explanations of the phenomena in their own way. An account of the habits of the cuckoo, for instance, was apparently absorbed at the time, but was reproduced thus a few days later: "The cuckoo? Oh, that's the bird that doesn't lay its own eggs."

"A Kalamazoo Direct to You"

You save from 20% to 40% by buying a Kalamazoo Stove or Range direct from the factory at lowest factory prices. Moreover, you get a stove or range not excelled by any in the world. We guarantee quality under a \$20,000 bank bond.

We Ship On 360 DAYS APPROVAL and We Pay the Freight.

If you do not find the Kalamazoo exactly as represented, the trial does not cost you a cent. It will pay you to investigate.

Send Postal for Catalog No. 189.

All Kalamazos are shipped promptly, blacked, polished and ready for use.

Kalamazoo Stove Co., Mfrs., Kalamazoo, Mich.

All our cook stoves and ranges are fitted with patent oven thermometer which makes baking easy.

The Kansas State Agricultural College

OFFERS courses in Agriculture, Domestic Science, General Science, Mechanical Engineering, Electrical Engineering, Architecture and Veterinary Science. Also short courses in Agriculture, Dairying and Domestic Science. Admission direct from the country schools. A preparatory department is maintained for persons over eighteen. Necessary expenses low. BEACON-ITE LONG-LIFE ROOFING WE PAY THE FREIGHT

When you buy roofing you expect it to last, don't you? You don't want to be incessantly patching little leaks after every rain. Isn't this just what you are doing now? You have had some experience with tin and shingle roofing.

Are you satisfied with their lasting qualities? BEACON-ITE is a long wool fibre thoroughly saturated with a secret preparation that makes it absolutely water-tight.

It will not rot or rust. By buying direct from the mills and putting it on your self (we furnish all necessary nails and cement free), Beacon-ite is the most inexpensive roofing you can buy. If you want a roofing that will last and need no patching, write-to-day for FREE samples of BEACON-ITE.

BEACON-ITE MILLS, 1106 N. 2nd Street, St. Louis.

The Young Folks

Attractions of Our Early Homes.

My little birds with backs as brown As sand, and throats as white as frost. I've searched the summer up and down, And think the other birds have lost The times you sang so sweet, so low, About the old house, long ago.

My little flowers, that with your bloom So hid the grass you grew upon, A child's foot scarce had any room Between you—were you dead and gone? I've searched through fields and gardens rare, Nor found your likeness anywhere.

My little hearts, that beat so high With love to God, and trust in men, Oh come to me, and say if I But dream, or was I dreaming then, What time we sat within the glow Of the old house hearth, long ago?

My little hearts, so fond, so true, I searched the world all far and wide, And never found the like of you; God grant we meet the other side The darkness twixt us now that stands, In that new house not made with hands.

—Alice Carey.

Fleetfoot: The Autobiography of a Pony.
MARION SEWELL.

CHAPTER I.—LIVING AND LEARNING.

Somewhere out on the prairie my life began. It was in the spring time when old Earth was at her best, and, as with all young animals, the greater part of my days was spent in sleep, but during the intervals of wakefulness when I took the trouble to look about me, I was much pleased with what I saw and heard.

The soft grass and blooming flowers impressed me favorably, while the sweet music of singing birds and the unceasing murmur of a brook near by had a cheering and uplifting effect upon my mind.

Had I been older and wiser, it is likely that the satisfaction which I felt in the present would have been lessened by thoughts of the future. It is possible that across my mind's eye would have come a vision of a frozen brook and my mossy bed transformed into a bank of snow, and I could have foreseen myself confronted by emptiness and desolation.

Happily, then, for my peace of heart, I was entirely unaware of the existence of winter or of anything else that was not comfortable. Consequently, my only two ideas were that life was sweet and that it was always spring.

But alas! one can not dwell long in this world and remain ignorant of trouble. If we live we must learn; and surely I was young enough when I received my first lesson.

This eventful day was not as clear as usual; to put it plainly, a heavy fog had settled over the landscape and a drizzling rain sifted down from the darkened skies.

The flowers which had been the source of so much pleasure to me in my waking moments now appeared only as blurs in the tall grass, and I was unable to distinguish one color from another.

I had never before known my bird friends to be anything but artists in the way of song, but at that time they gave nervous little squeals and gasps, and eventually dropped into a drowsy silence.

The brook which I loved so well on account of its soft and soothing ways, I suppose, that it was called upon to relieve the situation, gradually worked itself up into an unpleasant roaring sound, thereby making matters worse than ever.

The moisture which was collecting upon my thin coat gave me a chilly feeling, but more than all other distasteful sensations combined, there came upon me suddenly the perception of a great loss and I felt very helpless as I staggered about on my wobbly legs.

The cold rain fell faster and faster, everything seeming each minute to grow less distinct, and a dull misery crept into my heart and took possession of me.

But I decided to try to make my way onward for it was only by moving about that I could hope to find my friend, the one who had taken such good care of me, but who was now lost somewhere in the thick fog.

What was that? The clatter of advancing hoofs! Now surely my friend is coming back to me and the chill will be taken out of my stiffening limbs by the warmth of her breath, and the soft, caressing whinny will tell me that I need not be afraid.

But no, they have passed by and left me far behind. Still I am resolved to keep on going and perhaps after a

while I may find light and with it will return the dream-like beauty of yesterday.

Yesterday! how long ago that seems! Surely it is ages since I have had anything to eat, since I have lain joyfully and contented in the warm sunshine.

But there! what a little stumbler I am; my feet turn under me at nearly every step. It is hard to make one's way in the dark; but I will be very careful and pretty soon I shall find the light.

Ah, there it is! but only for a moment; one great, white flash, and it is darker than ever. And that heavy, rumbling sound, filling up the place where the light ought to be; I never heard a noise like that before.

More lights far away and more rattling sounds so near that they frighten me. I am proving myself a coward, but I think it because everything is so strange and black.

Now, I am afraid to take another step forward; however, I need a rest, for my legs ache and ache and I am trembling all over. I wish the grass wasn't so wet so that I could lie down and sleep.

Did I fall? Well I will remain here a little while, but I know that I can not sleep, for I am so cold and so hungry, and oh, I am all alone.

CHAPTER II.—BIG JAKE.

I do not wish to go into details concerning the lack of knowledge which I possessed in the early months of my life, but will endeavor to give my readers the benefit of an advanced and hard-earned education.

I did not know the name of anything then and had but limited reasoning powers. Of course, all that is different now, and by looking back over past years I am pretty well able to tell what took place from the time when I awoke to the realities of life, that is to say, the two days and one night when I was lost, and wandered, panic-stricken, through a dense fog which later developed into one of the most severe thunderstorms of the season.

I am not sure how long I lay on the wet grass when I dropped down, a forlorn little heap, worn out by hunger and aimless wandering, but when I again opened my eyes a great change for the better had taken place.

The air was clear and there wasn't a cloud in view. The sun shone dazzlingly bright, and its heat was very good to feel after the long hours in which I had been chilled through and through.

I was a long distance from the brook and could not hear it now even when it roared, but the birds were more melodious than usual as they hopped about singing their sweetest; it must have been a song of thanksgiving in which they all united because the clouds had disappeared and the awful noises and strange flashing lights were gone, leaving a world just as it was before—full of peaceful beauty.

I was thankful also, but I had no heart for music, nor did I feel like gamboling about and showing my pleasure in a coltish way, for I was too hungry and lonely to display any signs of joy.

Raising myself and looking around, I could find but small encouragement in the miles and miles of green sward. Then suddenly out of the distance appeared multitude of heads, and in a few moments a large body of high-spirited horses came rushing in my direction. I hastily arose on all fours, filled with confusion and not a little dread, not knowing how I could escape being trampled by those flying feet.

Somehow they went past without even so much as touching me, and my knees bent under me with involuntary devotion as I looked after them, dazed and grateful. Then, to my surprise, I saw one of the herd, the very largest and apparently the leader, turn his head and come cantering slowly back.

The others, though they were going at their best speed, noticed the large horse's movement and wheeled about with the intention of accompanying him, but it was evident that he had no desire for their society just then, for he elevated his long neck and gave a ringing neigh in which even I, inexperienced though I was, caught a note of warning.

After a moment's hesitation his disappointed followers changed their course and trotted off in the opposite direction, leaving him to make his return journey alone.

Although I was relieved to know that the reckless galloping troop was not coming my way again, I still felt far from easy in my mind, and I had, to all appearances, good reason to be afraid, for as the long-necked captain

while I may find light and with it will return the dream-like beauty of yesterday.

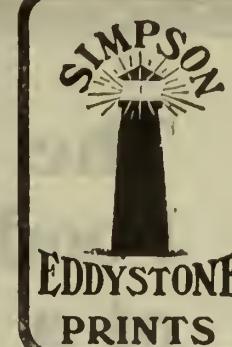

Yesterday! how long ago that seems!

Surely it is ages since I have had

anything to eat, since I have lain

joyfully and contented in the warm

sunshine.

Simpson - Eddystone Silver Greys

Beautiful. Cheerful. Dignified. They make dresses whose appearance far surpasses the looks of other materials equal in cost. They wear better, and are good all the year round.

LOWELL INGRAIN CARPETS

"The all wool kind"

We have been telling you for weeks **WHY** you ought to insist upon getting a **LOWELL INGRAIN**—the **all wool** kind—when you buy a carpet. Thousands have taken our advice and are highly pleased.

ISN'T IT TIME FOR YOU TO CONSIDER BUYING

Remember these points: Cover the whole floor—it's warmer, and easier to take care of; can be used on both sides, a great saving. **LOWELL INGRAINS** are made that way; can be had in newest styles and colors, just like high grade carpets. If it is wound on a **hollow stick**, it's a genuine **LOWELL INGRAIN**.

When you buy carpets, ask the local dealer for **LOWELL INGRAINS**. Look for the **hollow stick** and run no risk. Don't accept any other.

Manufactured by **BIGELOW CARPET CO.**, New York

of the herd continued to approach he seemed to assume gigantic proportions, and the deliberate canter with which he made directly for me promised more danger than had the mad rush of his comrades, since I was fortunate enough not to lie in their path.

When at length he reached me I sank down close to the ground, and shutting my eyes tight expected the worst. But somehow he seemed in no haste to devour me, for when he came within a few feet of where I crouched, the heavy hoofs ceased to move, and raising my eyelids the least bit I saw him stretch his neck and lay his head near the ground in order to scrutinize me more closely.

Presently he walked up and touched me gently with his warm nose, and his long mane seemed to fall over my back and cover me like a shawl. Then for the first time I gathered courage enough to open my eyes and I saw with pleasure that, notwithstanding his mammoth size, the intruder was not such a fierce creature after all.

In the first place, he was very fleshy, and perhaps this fact helped to make him so much larger than any respectable horse ought to be.

In color he was a dark glistening bay, and the wavy black mane and tail almost swept the ground. Just now as I peered anxiously up at him, he regarded me solemnly through a luxuriant black foretop, and in the depths of the kindly brown eyes I felt that a knotty problem was trying to solve itself.

He was surely at a loss to know what to do. He looked at me helplessly, then neighing softly raised his head and glanced in the direction of his retreating comrades. Bending down again he tore up a great mouthful of grass and held it between his strong white teeth. This last act seemed to afford him an inspiration, for the troubled look left him at once and he began to shove me about with his nose; so insistent did he become that I had no other choice than to rise to my feet. This accomplished, the big horse was greatly encouraged. His next step was to gather small quantities of grass and as it left the earth with a musical rippling sound, I was charmed into imitating him.

We traveled slowly on, and before I realized what I was about, the dreadful gnawing hunger had left me, and I was almost comfortable. The heat of the sun, added to the exercise I was taking, warmed me thoroughly and for the time being I forgot my sorrowful plight.

After a while we came to a spring where the water gushed up as clear as crystal. My new friend bent his head and drank long, delicious sips, and watching him I quickly learned to do the same. The big horse seemed pleased with my aptness, for after looking at me a moment with unmistakable admiration he laid his heavy jaw upon

my neck and appeared to be taking in the beauties of the landscape.

Feeling as I did such gratitude for his kind attentions, it would have been the height of impoliteness to give any sign of weariness, even though I languished under so great a burden, for I verily believe that the big horse's head weighed more than did my whole body.

As soon as courtesy would allow, I drew gradually off and made a pretense of nibbling the tender grass. This seemed to bring my friend to his recollections, for after glancing lazily about him, he started in a cumbrous trot up a nearby hill while I followed closely at his heels.

At the brow of the hill we came suddenly upon two men who were digging deep, round holes in the ground. They were so busily engaged in work and conversation that they did not notice us at first and the big horse, taking advantage of this fact, scratched his chin against the loose board on top of the fence.

Those being the first persons I ever saw, I watched them very closely and also a little fearfully, not having much trust in strangers, and although I walked up quite near, I was prepared to spring off at the least sign of danger. Still the pair worked on entirely regardless of me and my timid feelings; nor did they even turn their eyes in our direction until my companion, growing reckless with the vigorous exercise he was taking, bent the board so far back that it snapped sharply and then fell clattering to the ground. Both men looked up hastily, but instead of being either frightened or angry they laughed good naturedly.

"Well, if that isn't Big Jake!" exclaimed the younger of the two, dropping his spade and advancing toward us, at which action I wisely retreated but still remained within hearing distance.

I knew my name wasn't "Big Jake," but of course could not tell what means might be adopted in order to capture me; the bay horse was less suspicious, in fact, he appeared not in the least disturbed.

"Don't you know me, old fellow?" queried the man as he came nearer, then gladly, "Of course you do, and you are as fat as ever and as wise as ever, and, Jakie boy, where did you get that poor, starved-looking little colt?"

Big Jake, who was nibbling softly at the speaker's hat, laid his head on the broad shoulder and whinnied gently.

"Ah, you say he just followed you. To be sure he did, and I don't blame him either. Didn't I follow you many and many a time myself?"

Just then the other man came up, mopping his face with a large, blue handkerchief. The sight of his friend discoursing with Big Jake seemed to amuse him very much. He stood in an attitude of mock attention, leaning his head forward as if to drink in every word. His fellow workman, knowing nothing of all this, went on talking.

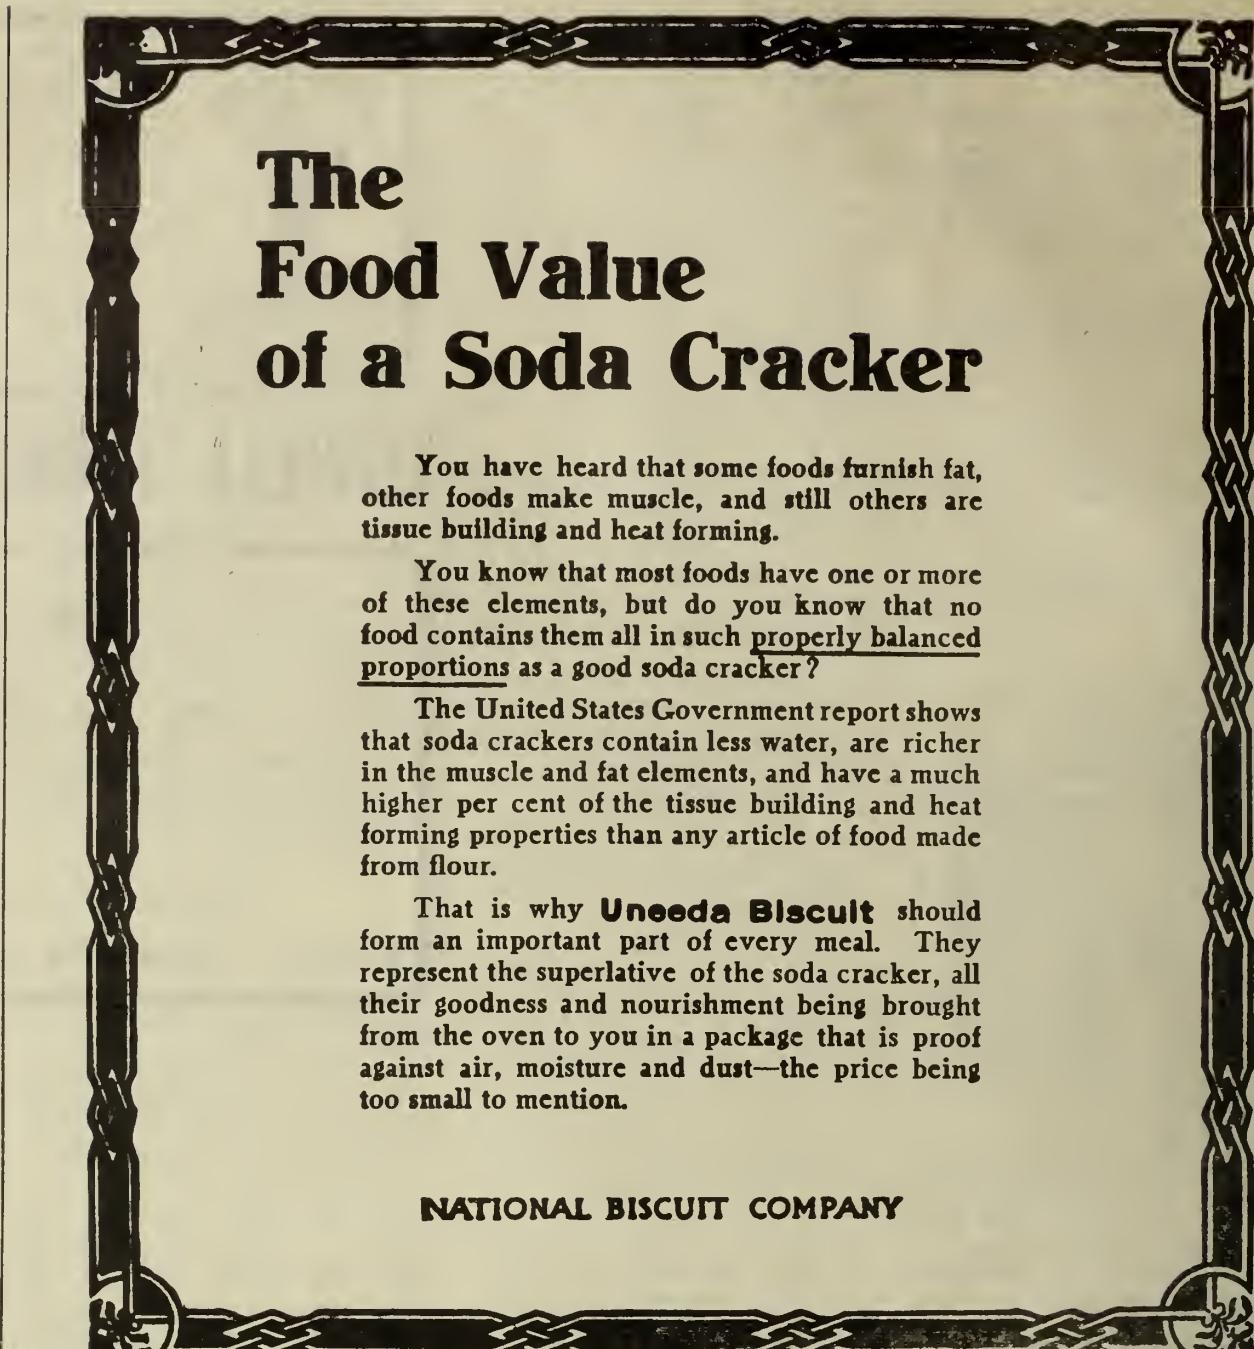

"And don't you remember, old man, the day you refused to go over the railroad track? How I thought you had balked and how I scolded you because I was in a hurry? And you, wise chap, never stirred an inch, and I was just in the act of lashing you when the train thundered by. That was one of the times you saved my life and, Jakie, do you know that I have always since been glad that I am slow to use the whip?"

I drew a little nearer, and the jolly man who was listening with so much mockery ceased laughing. Big Jake tossed his head carelessly, as if to say, "No horse would have gone over the railroad track just then."

There was small doubt but what those two had been old acquaintances. The voice went on, thrilling with the memory of days gone by.

"That awful snowy night when we were delivering the Christmas things. Every horse on the whole force but you, Jake, gave out, and your poor hoofs were a sight to see. Have they grown out? So they have, and are just as good as new. No one would guess that you ever suffered, old fellow, you have such a prosperous appearance. Something like myself, eh? Well, it's just as good to keep a brave front, but we won't forget what we went through together. Let me see if I can find the scar where the shaft pierced. Oh, that reckless snob! Yes, here it is, covered up, of course, with glossy hair.

"I can never forget how you moaned, Jake, and when the Vet said you couldn't get well I looked all over town for the heartless villain that had killed you. He was gone, though,

The Food Value of a Soda Cracker

You have heard that some foods furnish fat, other foods make muscle, and still others are tissue building and heat forming.

You know that most foods have one or more of these elements, but do you know that no food contains them all in such properly balanced proportions as a good soda cracker?

The United States Government report shows that soda crackers contain less water, are richer in the muscle and fat elements, and have a much higher per cent of the tissue building and heat forming properties than any article of food made from flour.

That is why **Uneeda Biscuit** should form an important part of every meal. They represent the superlative of the soda cracker, all their goodness and nourishment being brought from the oven to you in a package that is proof against air, moisture and dust—the price being too small to mention.

NATIONAL BISCUIT COMPANY

slipped out in the night like the coward that he was. But you pulled through all right after all. It takes a good deal to destroy a hero."

As he concluded he stepped back in order to better admire the hero, at the same time coming down stoutly on the other workman's toes, and was thereupon brought back to earth and present things by a vigorous shaking.

When Jake's old friend had regained his hat which had fallen from him in the midst of the scuffle, the two men went off together laughing, but when they had gone only a few feet one of them turned and called back merrily, "Goodbye, Jake; see you later," and my big comrade replied with an energetic nod and the pricking up of his long ears.

After watching the retreating forms of the workmen until satisfied that they were not coming back, Big Jake opened his jaws in an expansive yawn, then slowly and laboriously bent his knees under him and stretched himself with a contented sigh on the soft grass.

Immediately I felt lonely, and covering the short distance that lay between us, I bent low over the mammoth head. Big Jake, the hero, was actually snoring!

The Little Ones

Fay Folk.

Some nights I try to keep awake
To see how fairies really look.
(You have to watch so sharp and still,
So says my mamma's Fairy book.)

I squint my eyes a tiny space
And then I see them—one by one—
Come trooping in from Fairyland
With funny little hop and run.

They nod and whisper to themselves—
Then scamper off across the floor
As if they'd never, never seen
A little boy like me before!

Yet if you ask me how they look—
Somewhat I can not seem to tell;
For pretty soon they've slipped away—
And then I hear the breakfast bell.

—Laura Simmons, in Lippincott's.

Mr. Whirligig.

"Look at it! Look at it quick, Helen!" cried Ruth,

"Do you 'spose its dizzy? Oh, it's

just a butting its head into that board!"

"Acts just 'zactly like our little kitten did when it had a fit," said Helen, resting her hands on her knees and bending above the strange insect.

Ruth came running up to me flushed and breathless. "Can you come very quickly, mother? A poor little bug is having a fit or something," she said.

I walked down the bank at once. Ever since the little girls had begun to watch the ant-hill they seemed to have become more interested in the insect and animal life about them.

I followed her to the edge of the pond, where Helen bent above a very large whirlygig beetle.

"Oh, that's Mr. Whirligig," I said. "Did you never see him before? He isn't having a fit, and he isn't crazy, either. That's just the way he intends to act. You see he is named Mr. Whirligig Beetle because he spins round and round like a top."

He was of a bright, bronze color, and he was using his hind legs for oars, and his fore legs for rudders.

He looked very funny, and I was not surprised that the little girls concluded he was crazy.

"Do you see his eyes, Ruth?" I said. "He has a pair of eyes on each side of his head. One-half of the eyes look up and one-half down. Isn't that strange? The eggs are put on leaves or stems above the water, and a silk case or bag is spun to hold them. Mr. Whirligig is usually a small beetle and whirls, whirls, whirls. Then he keeps still for a second and then begins again."

"He is interesting, but I think that some of his cousins are more so. Mr. Whirligig lives near shallow water like this."

"What are some of his cousins," asked Helen.

"Oh, he has a great many, for Mr. Beetle belongs to a very large family. Did you ever notice, perhaps out on the rose-bush, a tiny, horny little thing? It is bright red and shining, and has little black specks all over its back."

"Lady-bug, Lady-bug, fly away home, your house is on fire and your children will burn!" cried both the little girls at once.

"Yes, you've guessed it. We call her the Lady-bug, but she is one of Mr.

ROOFING

Whirligig's cousins. In its life the beetle makes three changes. First of all is the little white or light-colored egg; then a fat, greedy, white worm, not at all attractive looking. This is called the larva, and means 'a musk.' It's a very good name, too, for you would never guess that the fat, white worm you find hidden away under a stone, or in the earth, is a child of Mrs. Beetle. It does not look in the least like her. After this it becomes a pupa—and that means 'a baby.' It is in a case now, or a cradle which looks much like a hen's egg. It is folded up in this little cradle, with its wings packed close by its side, its jaws and feelers laid on its breast, and it has nothing to do but wait. When it becomes like its mother, we call it the 'Image state.' People like to study beetles because they are so easy to get, and many of them are very beautiful to look at. Sometimes the beetle-cases are dotted and lined in such a wonderful and perfect way that they look as if they had been carved from wood. In olden times there was an insect of the family of rose beetles in Egypt. The Egyptians considered it sacred and worshiped it. Sometimes they would wear a stone or wooden image of it about their necks to keep off harm. This kind is called the golden beetle and is very pretty. It does not hold the wing-cases apart when it flies, but wide, thin gauze wings come from beneath them. The body, head, legs, and wing-cases are a beautiful golden green with silver lines and spots. It's a very brilliant looking insect as it darts about in the sunshine. But people do not like it for all that, for it spoils rose-bushes. The farmers dislike all kinds of beetles for they are such a large and greedy family. They spoil trees and crops."

"They are nice to learn things about, but I believe I like our ants better," said Ruth.

The Traveling Libraries.

There are many things to be enjoyed in this world of which we do not have to avail ourselves. One of these things that is "free for nothing" is the pure, fresh air. Most people are too much absorbed with other things or too lazy to take in more than half a breath, when long, deep breathing would send the blood through the system giving renewed life and energy to the whole body.

But I started out to tell about the Traveling Libraries which are rendering such splendid service to thousands of people who have availed themselves of their opportunities and advantages, and to urge the clubs that have not enjoyed their benefits to proceed to do so at once. One of the long-felt needs of people living in small towns and the country has been that of plenty of good literature—such as is afforded by the free libraries of the cities—and these libraries fill this want. They are made up in cases of fifty books each to suit the individuals ordering, thus reaching the needs and tastes of the people. These libraries make it pos-

sible for any one to have entertaining and wholesome reading—no matter how remote he may be. These are especially well adapted to the needs of women's clubs in the country. It was through the work and influence of club women that this benefit can be enjoyed. These libraries will be sent to any group of persons to be used for six months. There is no charge made for their use, but \$2 is charged to defray the expense of sending them. That is a very small amount when divided among all the members of the club. Every club in country or town where there is no public library should arrange to use these.

FAMOUS WOMEN.

Madame De Staél.

I. Life of Madame De Staél.
II. Madame De Staél's literary merits.

III. "Corinne."

IV. Madame De Staél and Napoleon. I. One of the most brilliant women that ever lived is the subject of this sketch. She was precocious as a child and was given every opportunity by her admiring and wealthy parents, both as to instructors and society, and fortune smiled upon her from the first.

II. While she was especially noted for her social successes and attainments, she towered above the women writers of her time. Her literary career began before she was twenty and ripened with age. She was fifty when death overtook her, but even then, she was pronounced the most intellectual woman in the world.

III. "Corinne" was published in Paris ten years before she died. One writer says of it: "It is one of the few immortal books which the heart of the world cherishes." It will make interesting reading and a review of it would be interesting.

IV. Napoleon and Madame De Staél were enemies. While she believed as he did in politics, she had no confidence in his sincerity and detested him as soon as she saw him and opposed and defied him. Her bitter sayings and ridicule so irritated him that he banished her from her beloved Paris.

Federated club departments will be conducted in the following Chautauqua assemblies during the coming summer: Ottawa, June 19-29; Winfield, June 19-29; Pittsburg July 2-12; Clay Center, July 27-August 5; Lincoln Park (Cawker City), July 27-August 5.

Lives That Endure (Consecration Meeting).

The human soul covets the quality of permanence. It revolts from the ephemeral. It seeks something which will resist both time and change. This is what the pyramids and Coliseum mean. But after all this quality is not found in any material substances. It is the characteristic excellence of the human spirit alone. After the material structures that are in the world, even the most enduring of them, have been burned up, the characters of the builders, be they good or evil, will survive. Goethe falls a little short of the Christian ideal when he says, "What we poor mortals have to do is to keep ourselves upright as well and as long as we can." There is a hopeless tone in that which is not characteristic of the teaching of Jesus. He who does the will of God abides forever. He builds on bed-rock, and may defy all winds and floods. In no other way will the human craving for permanence be satisfied. After elements melt and heavens are rolled together, character will survive and endure.

Homeseekers and investors are beginning to realize that the dry irrigated lands of the famous Arkansas Valley in Western Kansas and Colorado possess the greatest value of any farm lands of the country. These lands yield annually over 60 bushels of wheat per acre. The average net returns from sugar-beets is \$95 per acre. The well-known firm of D. H. Bane & Company own many thousand acres under irrigation, and are offering them at prices per acre within the net returns of a single year's crop. Crop failures are unknown in that rich section where the United States Government is spending three million dollars for the benefit of homeseekers and investors. Write to P. C. Reilly, 824 Kansas Avenue, Topeka, Kans., for detailed information about this wonderful region.

Attention is directed to the new advertisement of the Jumbo squabs and Buff Orpingtons and Buff Leghorns as described in the new catalogue from our advertiser, W. H. Maxwell, 1220 Quincy Street, Topeka, Kans. To breeders of the variety named and squab-breeders this catalogue will be of special interest and it will be sent free to any one requesting the same.

THE KANSAS FARMER

\$19.90 **CREAM SEPARATOR**
TWO MONTHS' FREE TRIAL

\$19.90 IS OUR PRICE FOR THIS WONDERFUL NEW IMPROVED 1906 MODEL HAND CREAM SEPARATOR.

AT ABOUT ONE-FOURTH the prices charged by others, we furnish the highest grade hand cream separators made in the world. Compare with any other separators made, ours has

GREATER CAPACITY, skims closer, skims colder milk, runs easier, and

besides our price is a mere fraction of what others charge. We give

you two months' free use and free trial, we issue a binding twenty

years' guarantee, we take care of your separator for you free from

the day you receive it, and we will always in the years to come

furnish you any needed repair or part promptly on a day's notice.

IT IS SO EASY TO HANDLE that by following the simple printed instructions we

send you, anyone without previous experience can operate it at

once, and do better and more work than can be done with any

other separator made.

OUR SEPARATOR WILL SKIM 1,000 POUNDS

OF MILK PER HOUR

and do it closer, better and easier than any other separator of like size will skim 500 pounds in one hour.

OUR SEPARATORS will skim twice as close, twice as easy, last twice as long as any other hand cream separator made, and yet we furnish it for just a few dollars compared with the prices charged by others. Our price is based on the actual cost of material and labor, and is a small part of what others charge,

AND OUR TERMS ARE SO LIBERAL TOO.

OUR GREAT FREE OFFER.

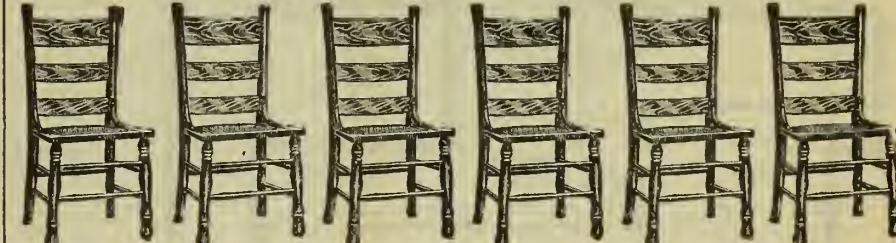

On a postal card or in a letter to us simply say, "Send me your Free Cream Separator Offer," and you will receive by return mail free, postpaid, our very latest special hand cream separator catalogue (just out), with pictures of our machines, copies of medals, diplomas and awards taken at different exhibits all over the world in competition with other separators, pictures of all the parts, full descriptions, testimonials, official and general endorsements and our great \$1,000.00 quality challenge, also copies of our guarantees, etc. We will also send you our two months' free trial proposition.

Our separator will save you \$10.00 to \$15.00 a year on every cow you keep, paying for itself several times over in a year, besides two months' use costs you nothing. Don't fail to write and let us mail you our free book and wonderful free trial separator offer.

Write today for our new and wonderful Cream Separator Offer.

THESE SIX CHAIRS FREE.

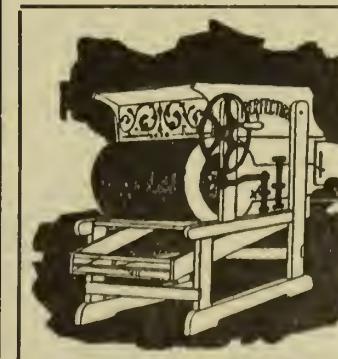

We will send you free these six large, full size, beautifully finished, handsomely embossed, hardwood cane seated chairs when all your orders to us have amounted to \$50.00, or you can have your choice free of many other valuable pieces of furniture or other useful things; a buggy, harness, saddle, bedroom suite, organ, couch, dresser, or your choice of hundreds of similar valuable articles. All this will be fully explained when you write for our Free Cream Separator Offer. On a postal card or in a letter to us today be sure to ask us to send you our Free Cream Separator Offer, and get all we will send you free by return mail, postpaid. Address,

SEARS, ROEBUCK & CO., CHICAGO.

Do You Know?

That one handful of noxious weed seed to a bushel of your grain, if planted, will absolutely ruin the crop. There are many cleaners that will remove all but that last handful of the weed seed from your grain, but the "Perfection" is the machine that does the work the way it should be done. Better own the machine that is easy to operate, easy to understand, and yet does its work so perfect that your crops are increased 25 per cent to 50 per cent. :: ::

A "Perfection" cleans, separates and grades anything from Corn to Red-Top.

Write us today and we will tell you what it will do as well as show you how it does it. Be sure and tell us the kind of grain you raise.

**FOR A Y. M. C. A. BUILDING AT THE
KANSAS STATE AGRICULTURAL
COLLEGE.**

(Continued from page 369.)

and Rockefeller. Perhaps this would not succeed in any case, and it may be objectionable to many Kansas farmers who would themselves prefer to endow such a building at their own Agricultural College.

A. M. TENEYCK.

A History of the Movement.

The movement for a Young Men's Christian Association Building was publicly inaugurated May 22, 1904. On that

ent scheme of enlisting the sympathy of the farmers of the State will result in a speedy completion of the project.

LOCATION.

The building will be located on the Association lots, corner Fremont and Ninth Streets, just north of the northeast corner of the Park. This location has several advantages, among which may be mentioned (1) nearness to the Park, (2) center of the student population, and (3) location on the proposed paved road to the college.

GENERAL DESCRIPTION.

The building will be of stone, 76x45 feet, with gymnasium annex 70x42 feet.

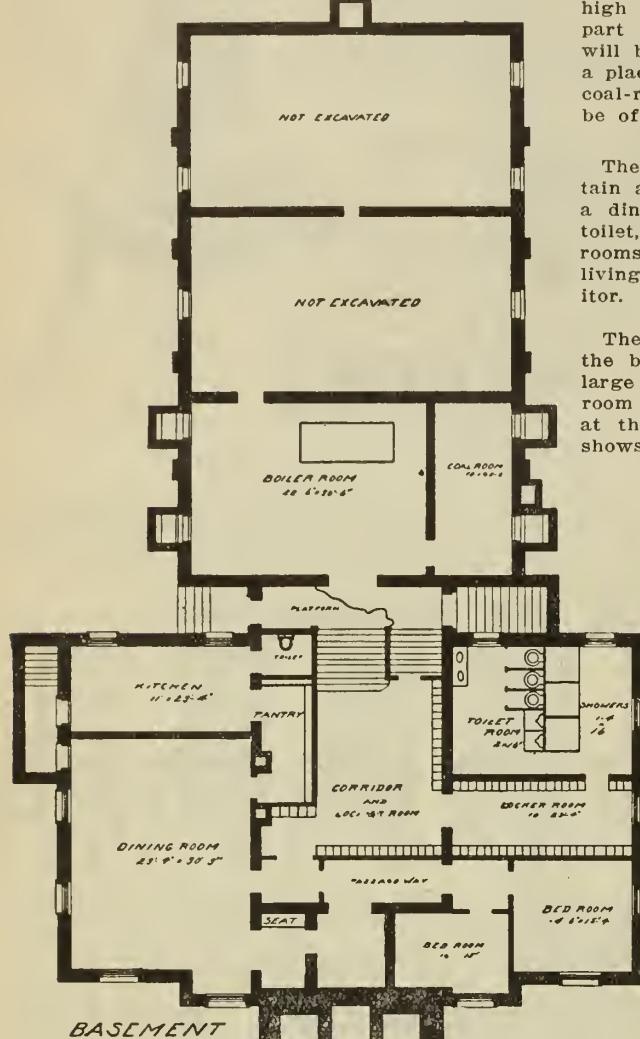

It will be three stories high and basement. A part of the gymnasium will be excavated to make a place for the boiler- and coal-rooms. The roof will be of slate.

BASEMENT.

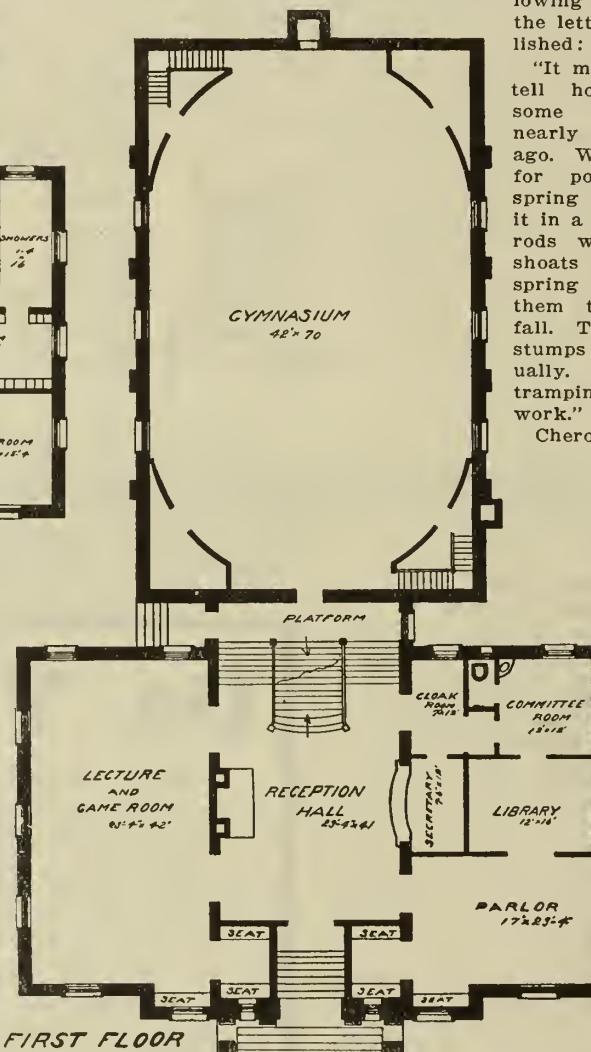

The basement will contain a kitchen 11x23 feet, a dining-room 23x30 feet, toilet, bath and locker rooms. There will also be living rooms for the janitor.

FIRST FLOOR.

The Main Entrance to the building opens into a large lobby or reception room 23x41 feet. A glance at the first-floor drawing shows that this reception

BASEMENT

FIRST FLOOR

day Mr. E. T. Colton, of the International Committee of the Young Men's Christian Association, made an eloquent appeal for an Association Building at a mass-meeting of the young men of the college. Nearly \$6,000 was pledged by the students at this meeting, and by the close of the term \$3,000 more was added. The average student gift at this time was about \$40.

During the next year \$5,700 more was subscribed by the students so that altogether over \$11,000 was pledged by students alone. This heroic giving has not been done by wealthy students, but for the most part by young men earning their way through college. Thirty-six of them have so realized the importance of a Y. M. C. A. Building that they gave \$100 apiece. No one can estimate the amount of sacrifice that the students are putting into this movement.

During the summer of 1904 a mail canvass was carried on among the alumni who responded quite liberally. In the fall, invitations were sent out to the business men of the city asking them to a banquet at the Hotel Gillette. Fifty-five of the most prominent business men of Manhattan responded favorably. H. M. Beardsley, of Kansas City, was present and made an address concerning the need for and purpose of an Association Building. A deep impression was made by Mr. Beardsley's excellent talk. A canvass of the business men was made immediately following this banquet.

On February 17, 1905, an offer of \$1,000 was made through the International Committee of the Y. M. C. A., by an unknown philanthropist in the East, provided the Association could raise \$5,000 more in three months. This offer stimulated giving to a great extent and the \$5,000 was raised.

The whole amount now subscribed is a little over \$22,000.

During the past six months the movement has not made much progress. The field around Manhattan is practically exhausted. Efforts were made, but without success, to get some man of wealth to give the sum required to complete the necessary amount.

It is earnestly hoped that the pres-

hall opens into a social or game room, 23x42 feet, to the left, a reading room, 17 x23 feet, and a library room, 12x16 feet, to the right in front, and the coat room, secretary's outer office, 7x12 feet, and inner office, 12x12 feet, to the right in the rear. The rooms on this floor are so arranged that in case of large social functions all can be utilized. The meetings of the Association will be held in the social room, which is to be provided with folding chairs.

SECOND AND THIRD FLOORS.

The second and third floors will be used entirely as dormitory rooms. Each floor contains nine sleeping rooms, bath and toilet rooms. These rooms will be among the best in town and will bring considerable income. In addition to this, there will be given the opportunity of concentrating the working force of the Association in one building.

GYMNASIUM.

There is an unmistakable demand for a gymnasium, as the college does not provide one. Even when it does there will still be need of a smaller gymnasium. The Association building will contain a gymnasium 70x42 feet. A running track will also be built.

then cut is liable to sprout badly, while a hedge that never has grown beyond the bounds of a good fence rarely gives trouble. Even the neglected one usually gives a good return for the land used when the crop of posts is cut, and the wood is probably the best grown.

"If the woven wire fence takes the place of the hedge around the horse pasture, there will be less cause to regret its going, but the Osage orange has been of good service to the horse-raisers, and will probably continue to furnish posts for many upland farms, where the catalpa does not succeed."

ALBERT DICKENS.

"Relying to inquiry in KANSAS FARMER of August 13, I will give my method of killing hedge. Remove soil from each side of hedge-row, say about one spade deep. Then fill up with crushed rock salt, about 300 pounds of salt to 100 feet of hedge."

Rice County.

J. F. SMITH.

"In answer to E. Southwick, I tried mulching a few rods of hedge last year with fresh stable-manure. It proved quite successful; but as I find a few green roots this spring, I think it will take two years to clean it out, mulching the second spring the same as the first; and if any sprouts should come through, they should be pulled up, not cut down; they will pull easily."

H. D. SHINN.

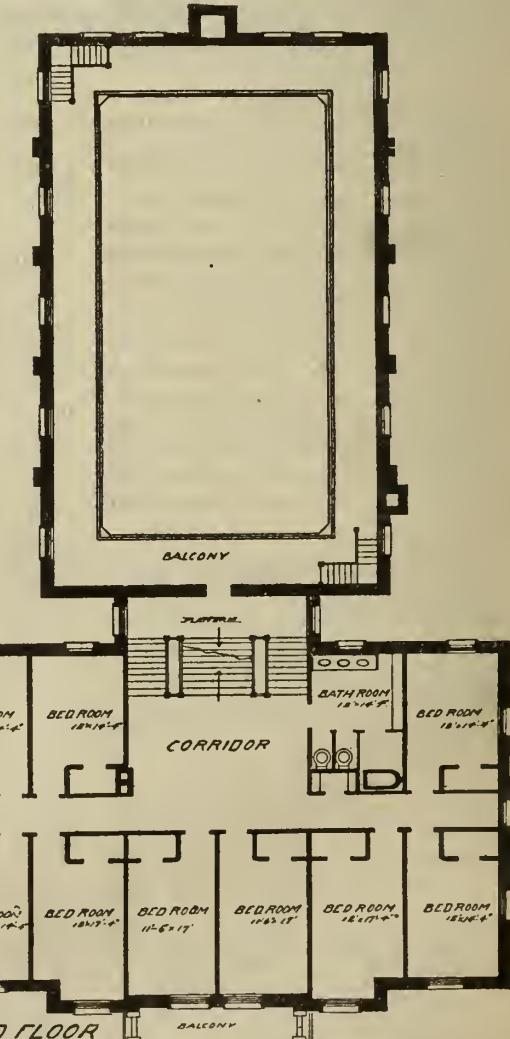

Montgomery County.

"One of your subscribers wishes to know how to kill hedge. I can tell you a cheap and sure way."

"Cut the hedge about four or five inches above the ground and take the ax and maul and split the stump like the letter X as deep as you can. Cut off a round pin and drive down into the center of the stump and fill full of strong salt (any dirty salt will do). This should be done any time from May 1 to July 15, and in one year you can plow up the stumps unless they are very large. It will surely kill them. After a heavy rain if the salt is washed out, put in a new supply. With a little attention I can kill the biggest hedge in the State in one season; or any other tree. I have used this for twenty years." A. M. MASON.

Crawford County.

"Relying to Mr. Southwick's inquiry, will say that the practice of

SECOND FLOOR

"Killing hedge is no easy matter. If thoroughly grubbed, the sprouts will cause trouble for some time. Cutting the hedge down during growing season, piling the brush on the row and burning when the new sprouts are well started is about as severe a check as can be given, but even then sprouts are sometimes very troublesome.

"If you grub it, about the easiest way is to trim the hedge high enough to allow you to work a plow close up to the hedge and then, with a road-plow and plenty of horses, get as close as you can before resorting to the spade and grubbing-ax.

"There are two sides to the hedge question and every one must choose his side. It costs considerable time and more patience and piety to keep a hedge-fence in good condition, but when well-kept it makes a handsome fence and is not likely to injure crops for any considerable distance. When neglected, it is certain to cost more. A hedge that is let run to posts and

mulching to kill hedge is quite common in this (Saline) County. After the hedge has been removed, usually by grubbing deep enough to allow plowing the ground, the row is covered with about three feet of mulch, preferably coarse manure and litter, as they pack closely and do not blow away. The mulching is left till late summer and then set on fire. The burning continues some time, and according to my observation kills nearly all the hedge the first time."

A.

Saline County.

February Imports and Exports.

Two-thirds of the fiscal year, ending June 30, 1906, has presented its commercial record, and the growth of commerce has been sufficient to justify the assertion that for the year both imports and exports will exceed those of any earlier like period. The exports of 1905 exceed those of any earlier year; yet the exports of that part of the fiscal year 1906 recorded are 190 million dollars in excess of those of the corresponding months of 1905. The imports of 1905 were also greater than in any earlier year, yet the import figures for the eight months ending with February, 1906 are 71 million dollars greater than those of the corresponding period of last year.

This growth in imports and exports is shown in detail in a statement just issued by the Department of Commerce and Labor through its Bureau of Statistics. It shows in exports a growth of 190 million dollars, manufactures being 45 million dollars in excess and agricultural products 133 million dollars in excess of the total for the corresponding period of last year. The large increase in exports of agricultural products occurs chiefly in wheat, wheat flour, corn, oats, and provisions. Of wheat and wheat flour, the exports in the eight months ending with February, 1906, were in round terms 64 million dollars in value, against 30 millions in the corresponding months of the preceding year. The exports of corn during the eight months were nearly 20 million dollars in excess of those of the same months of last year, while oats show an increase of over 10 millions and provisions an increase of 33 millions over corresponding exports last year. Exports in each of the great groups—products of agriculture, manufactures, the mines, the forests, the fisheries, and miscellaneous articles—show an increase over the exports of the same months of last year.

On the Import side all groups show an increase except articles of food, which in the eight months ending with February, 1906, amounted to but 171 million dollars, against 184 millions in the corresponding months of last year, the decrease occurring chiefly in coffee, tea, and sugar. Coffee shows a fall of nearly 12 million dollars; sugar, 5 millions, and tea about 2 millions, the decrease in these three items being nearly 20 millions, while in other articles of this class the increase is sufficient to make the net reduction in the entire group about 13 million dollars.

The most remarkable increase in the imports occurs in manufacturers' materials. The class "articles in a crude condition which enter into the various processes of domestic industry" shows for the eight months ending with February, 1906, a total of 264 million dollars, against 243 millions in the same months of last year; while the class, "articles wholly or partially manufactured for use as materials in the manufactures and mechanic arts," shows a total of 112 millions, against 92 millions in the same months of last year. Thus manufacturers' materials show a total gain of over 40 million dollars in the eight months ending with February, 1906, compared with the corresponding months of the preceding year, and seem likely to make by far the largest total of such imports in the record of our foreign commerce. The increase in the partially manufactured materials occurs chiefly in tin, copper, iron and steel, and chemicals. The increase in raw materials occurs chiefly in tin, copper, iron and steel, and chemicals. The increase in raw materials occurs chiefly in fibers, hides and skins, leaf tobacco, and raw silk.

The increase in exports of manufactures, aggregating 45 million dollars, occurs chiefly in cotton goods, which show an increase of about 8 millions; iron and steel manufactures, an increase of 16 millions; cars and carriages, an increase of 5 millions, and manufactures of wood, mineral oils, and leather, and manufactures thereof, each show an increase of about 2 million dollars, as compared with the same months of last year.

The rapid growth in the exportation of manufactures is illustrated by comparing the February, 1906, exports with those of February of each year during the preceding decade. It will be seen from the table which follows that the February exports in 1906 were nearly three times as great as those of 1896 while the growth of exports of manufactures for the entire eight months is correspondingly great, the total for the eight months ending with February, 1895, being 144 million dollars, against

387 millions in the eight months ending with February, 1906.

Exports of domestic manufactures from the United States during the month of February, 1896 to 1906.

Growing of Pitted Fruits.

We have exceptional climatic and soil conditions in Harper County for the growing of pitted fruits. Experiments conducted by the writer for the past ten years confirm this. We can grow abundantly the best peaches, plums, and cherries. The old peach orchard on the Firestone farm has fruited almost every year for nearly fifteen years; most of that time the orchard has been in the care of tenants, and has been without care save an occasional plowing. The fruit has been uniformly excellent.

Experiments with American plums indicate that the Damsons, large and small, and the Chickasaw do well; the Wild Goose rusts and drops its fruit.

The Japanese do splendidly but are subject to black knot on rich soil; this is particularly true of Abundance and Burbank. Prunes promise well in growth; the writer has a tree which will fruit this year.

Cherries have long been such a successful crop that it is strange the planting has not been larger. The tart sorts are practically all that are set, the early Richmond, Montmorency and English Morello comprehending ninety-five per cent of the planting. A sweet cherry has fruited several years on C. C. Whitman's lots; it was planted by Judge Cade. Although a shy bearer and favored by the birds, a good deal of excellent fruit is saved from it each year. The writer has a sweet cherry, Gov. Wood, which will fruit this year; he has grown many cherry-trees but never had another as fine and thrifty as this tree. Cherry-trees on rich soil are subject to occasional blight; if three-fourths of those set mature to fruiting time, they are doing well. When weeds and grass are permitted among them they are short lived usually dying in fifteen or twenty years, mostly from starvation. Cherries should be set twenty-four by thirty feet to do well; apples should be twenty-four by thirty-two feet. All orchards should be protected by a wind-break entirely around them but thickest on the south and west.

A splendid wind-break can be made of Russian mulberry, set four feet apart and headed low, for the outside row; then a row of Osage orange six feet apart, with an inner row of the Osage orange set twelve feet apart, the rows to be ten feet apart. The mulberries will grow ten or twelve feet high, while the next row will grow twelve to twenty, and the inner row should reach twenty-five to thirty feet in height in ten years or even less time.—W. E. Blackburn, in Anthony Republican.

Corn at the Kansas Experiment Station.

The following questions have been asked regarding the experiments with corn at this station:

1. What variety made the highest yield in 1905, and where was the seed obtained?

2. What place did the Hildreth corn hold in comparative yields of different varieties?

3. Where do you place Reid's Yellow Dent corn in order of yields?

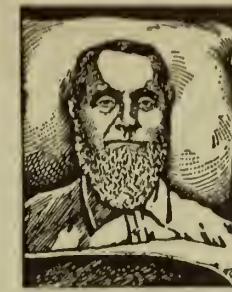

4. What place did Kansas Sunflower corn hold in the test? Is it an early or late maturing variety, and from whom did you originally secure the seed?

5. Do you or do you not believe that white corn will give larger yields on average Kansas soil than yellow corn?

6. What are the two best producing varieties of any color of corn which have been tested at the Experiment Station?

In our variety trial of corn last year (1905) some 80 different varieties were planted. Those varieties giving highest yields are as follows: Bicker's Chocho (yellow dent), Hildreth (yellow dent), Golden Row (yellow dent), McAuley's White Dent, Kansas Sunflower (yellow dent), Justin's White Dent, Warner White Dent, Elton White Dent, Forsythe's Favorite (white dent), Griffing Calico, Combination, Rummold (white dent), Hammett White Dent, and Leamington (yellow dent).

The highest yield recorded was 66 bushels per acre, by Warner's White Dent. This corn was tested for the first time last season, and was only a small

**I CURED MY RUPTURE**

I Will Show You How To Cure Yours FREE.

I was helpless and bed-ridden for years from a double rupture. No truss could hold. Doctors said I would die if not operated on. I fooled them all and cured myself by a simple discovery. I will send the cure free by mail if you write for it. It cured me and has since cured thousands. It will cure you. Write to-day. Capt. W. A. Collings, Box 109 Watertown, N. Y.

plot about one-half as large as the others. The seed came from J. Warner, Manhattan, Kans., and the corn was originally brought from Missouri, where it had been grown on the same farm for fifty years, according to Mr. Warner's statement. I do not know whether Mr. Warner has seed of this corn for sale or not.

The next highest yield was given by Combination which yielded 58.75 bushels per acre. This corn is sold by the Zimmerman Seed Co., Topeka, Kans., and is a mixed corn. This was the first trial of the corn made at this station, and on account of its mixed type it is less desirable than pure-bred varieties. The third highest yield, 57.3 bushels per acre, was given by McAuley's White Dent. The Griffing Calico ranked fourth with 56.6 bushels per acre. Justin's White Dent ranked fifth with 56.4 bushels per acre. This is the first year that this corn has been grown here. The seed was received from J. M. Justin, Manhattan. This is a red-cobbed white corn, very similar to the St. Charles White. I do not know whether or not Mr. Justin has seed for sale. The Elton White Dent (seed secured from E. F. Elton, Waldo, Kans.) yielded 54.7 bushels per acre; Golden Row, 53.75 bushels. Seed of this corn was secured from the Nebraska Experiment Station. The Hildreth corn yielded 51.75 bushels per acre; the Kansas Sunflower, 51.1 bushels; Hammett White Dent, 48.4 bushels; Boone County White, 46.3 bushels; Silvermine, 45.9 bushels; Reid's Yellow Dent on one plot yielded 45.1 bushels, and on another plot 42.3 bushels per acre.

The Kansas Sunflower corn dropped a little this year, but the average for the three years is well up toward the top. It is a medium late-maturing variety, and I consider it very hardy and one of the best for general planting.

As an average for three years the Hildreth ranks first, and in my judgment McAuley's should rank second, although we failed to secure the yield on it for the first year of the three. It ranked above Hildreth for two years.

We secured seed of the Kansas Sunflower corn from John Moody, Eudora, Kans. The Hildreth is an excellent corn, only rather late in maturing. Our supply of seed-corn is exhausted, except a little third-grade seed of McAuley's White Dent.

You will see that the Reid's Yellow Dent does not rank up with some of the native Kansas corn. It is a good early maturing corn and in Northern Kansas perhaps will rank better, as compared with late-maturing varieties, than it does at this station or further south. It is true, however, that the Reid's corn seems to be running out a little. We find a great many ears with smooth kernels—a tendency to flintiness—at the tips of the ears. Also some ears have shallow kernels, and the shoe-peg type of kernel is too prevalent. This corn also has the fault of often having too tapering a kernel, the kernels being very tight together at the crown but separated at the tip. By selection we are removing these defects, but this is the way the corn appears when we bring it from Illinois. I have little doubt that some of our best producing native Kansas corns will soon outrank the Reid's both in yield and in the winning of prizes at corn shows. Up to this time, however, Reid's Yellow Dent has stood well in contests because we are able to select a uniform type and well-finished ears.

As to whether white corn will outyield yellow corn depends upon the variety and also upon the conditions. Some varieties of white corn yield better than other varieties of yellow corn at this station, while the reverse is also true, certain varieties of yellow corn yielding better than other varieties of white corn. It may be true that white corn varieties, as a rule, have been those which have been grown under adverse soil and climatic conditions, producing hardy types of corn and good-yielding varieties under more unfavorable conditions. Under the more favorable conditions of fertility, moisture, and climate, varieties of yellow corn may outyield varieties of white corn; however, the question is a matter of variety rather than of color.

We have made tests for three years

with some varieties of corn. I place the McAuley's White Dent first as being the best producer of the white dent type. I am not so sure which variety should take second place, but the Boone County White is among the best. For your section of the State the Hammett White Dent might class second, or even first. The Hildreth corn stands at the head as the best-producing variety of yellow dent corn as an average for the three years' trial, while the Kansas Sunflower may rank second. Last season, however, as you will observe from the enclosed copy of letter, several of the new varieties tested outyielded the varieties named. There may be other varieties of corn equal or superior to those named, but we have not tested others for sufficient time to be able to recommend them as preferable to the varieties named. A. M. TEN EYCK.

Sow Alfalfa Without Nurse Crop.

I have ten acres of well-tilled corn ground which I wish to put into alfalfa. Would like information as to how and when to prepare seed-bed, time to sow, quantity of seed per acre, and what to use as a nurse crop. Any information you may see fit to give will be thankfully received. D. M. VAN PELT.

Mitchell County.

Prepare a seed-bed at once by diskling and harrowing and sow as soon as possible. We are now (March 31) seeding alfalfa. Twelve pounds of good seed is sufficient to sow per acre. Sow without a nurse crop. Alfalfa seldom makes a good stand when sown with a nurse crop. Clip the weeds with the mower two or three times during the season, but do not cut the alfalfa close to the ground early in its growth. Raise the sickle-bar so as to cut 4 to 6 inches high. If the young plants are cut off when they are small and tender and before a good root-growth has been established, the alfalfa is likely to be destroyed. I have mailed to you a copy of Bulletin No. 114 giving further information regarding the seeding and culture of alfalfa. A new bulletin, No. 134, will soon be published on this subject, a copy of which you may secure by writing to J. T. Willard, director of experiment station.

A. M. TEN EYCK.

A woman recently engaged to a widower asked his son, a little fellow of seven years: "How would you like me for your stepmother?" "First rate, as far as I am concerned," he replied. "You will have to speak to pa about it, though."—Illustrated Bits.

The Great Salt Lake, in Utah, is now crossed by a trestle bridge over twenty miles long. It is the longest trestle bridge in the world, and bears a railway, thereby saving a circuit of forty-four miles.

Horticulture

The Wellhouse Rabbit Trap.

At this season of the year when the damage wrought by the rabbits is seen at its worst, inquiries are sent to the KANSAS FARMER as to measures to be taken against this pest. One of the most successful plans is to trap the rabbits. This has been the method pursued for protection of the Wellhouse orchards for many years. THE KANSAS FARMER has frequently published descriptions of the Wellhouse trap. The illustration heretofore used was not quite accurate, so at the request of the editor, Master Walter Wellhouse, grandson of the apple king, has prepared an accurate drawing from which was made the engraving herewith. The

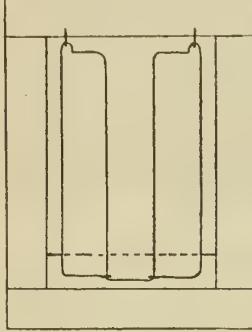

Fig. 1, Front.

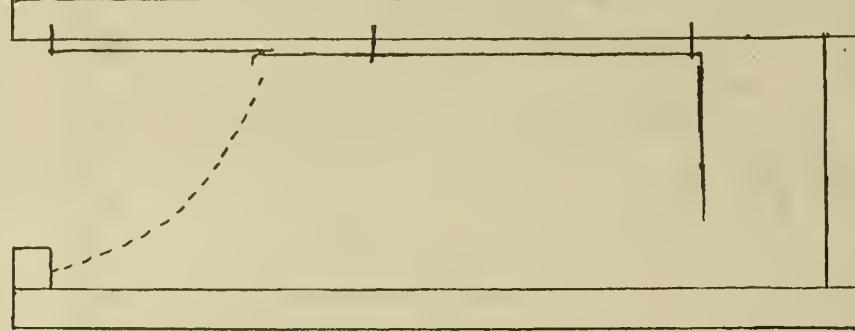

Fig. 2, Section.

The Wellhouse Rabbit Trap.

test of materials used will be found useful. Following is the description as dictated by Judge Wellhouse several years ago:

MATERIALS USED IN MAKING THE WELL-HOUSE RABBIT TRAP.

Four pieces 1 by 6 by 21 for sides, top, and bottom, one piece 1 by 6 by 8 for back; one piece $\frac{3}{8}$ by $\frac{3}{8}$ by $3\frac{1}{2}$ for door stop; $2\frac{1}{2}$ inches wire for door; 22 inches wire for trigger; $4\frac{1}{2}$ inch staples made of number 15 wire; 480 feet or twelve pounds No. 12 galvanized-iron wire and one pound of staples are required to make one hundred traps.

The Wellhouse trap is a box made of 6-inch fencing, old boards preferred. It is 21 inches long. The front end is closed only by a wire door which is hung from the top and opens inward. A cleat across the bottom prevents the door from opening outward. In setting the trap the door is fastened open by a wire which is attached loosely along the under side of the top board of the trap. This trigger-wire is bent downwards near the rear end of the trap and formed into a loop or a figure 8, so that as the rabbit crowds into the rear end of the box he is sure to push against this wire and thus move it backwards, releasing the door, which falls and makes him a prisoner.

The cottontail is generally looking for some dark hole in which to hide as a protection from enemies and cold, and this trap easily suits his mind. The great advantage of the Wellhouse trap is that it catches the rabbits. About three of these traps are used to the acre. They are not baited in any way. They may be placed in rows with the open ends in one direction in one row and in the opposite direction in the next row, so that when the boy goes to get the rabbits he can see into one row while going one way and into the next row while returning.

For jack-rabbits, greyhounds and the gun are perhaps the best remedies.

Care of Peach-Trees.

EDITOR KANSAS FARMER:—Having been highly interested in horticulture for many years, will bring up a matter which I consider of vital importance to the fruit-raisers of Kansas in particular. This relates to some means to prevent the destruction of the peach crop by frost. After several years' study and investigation of the matter, I believe that we may be able to raise a crop each year by pruning and protecting the trees. One instance which came under my observation is this: I noticed a tree by a ditch, which had been blown down and turned over by the wind. It was lying on the ground. Some straw was thrown over it in the fall and remained all winter. In the spring it came out in full bloom and yielded a crop of peaches. Another instance was where a tree was partly under a straw stack and was protected from the frost. It came out in full bloom in the spring. In both of these instances, these were the only trees

in the orchard that had a peach on them.

The plan I have in view is this. First give each tree a thorough treatment of pruning. In the fall by means of a draw rope, such as we used to draw our corn shocks together, bring the limbs close together. Then take old stack-stuff or ducking and sow around the tree from the body up, so as to form an enclosure, leaving it open at the top. Now take a step-ladder and through the opening in the top, fill the enclosure with chaff or fine straw, shaking the tree thoroughly to pack the straw. Next take a piece of oil-cloth and sew over the top and the job is completed. This can be done at an expense of not to exceed 50 cents per tree, over the labor. Two men can treat from 20 to 30 trees in a day. Think of having 20 or 30 trees full of fine peaches in an orchard in an off year—or an entire orchard—with no others in the locality.

plied for six weeks each year and plenty over for canning or for grape-juice.

Practically all the vines which die in this section may be said to be lost from overbearing. Even a moderate crop will kill a vine if the soil moisture is shared with weeds, trees, or grasses. A few tender varieties winter kill; vines of the Labrusca (Concord) family, have shallow spreading roots and suffer severely in dry years with even a light crop of fruit.

For table use plant Campbell's Early, a black grape; Green Mountain, white; and Headlight, red; all ripen from August 1 to 10. Then Worden, black (of the Concord family but larger and ripens earlier and evener); Beacon, a black, finely flavored grape, excels the New York Concords; Niagara, large, refreshing white grape; and Delaware, a medium red grape. These sorts are ripe from August 10 to 25. In setting a vineyard for table use, plant half of

FIFTH TERM
JONES' NATIONAL SCHOOL
Of
Auctioneering and Oratory
Davenport, Iowa

6th term opens July 23, 1906. All branches of the work taught. Students now enrolling in 15 states. For Catalogues write George M. Jones, President.

When the block is smoothed up it should be about 3½ feet in diameter at the top, and about 20 inches deep. Now we are ready to wrap the block with burlap or canvass, with slats or pieces of barrel staves about 20 inches long (old straight ones are good) tacked on about 2 inches apart. Put the canvass next to the earth and draw tight. Now take No. 12 wire and put one strand around the center and draw tight by twisting the ends together. I find it a good plan to cut slits in the canvass between a few staves and run wire through to keep the earth from slipping down and getting loose. Now put one wire near the bottom and then one next to the top and with a pair of pliers put kinks around in the wire to tighten it. If there is any space between the earth and canvass at the top, crowd the earth in with the hands so as to make it as solid as possible. We are ready now to commence to dig under, but we must be very careful not to disturb the ball of earth in the jacket. When we dig under all we can conveniently, we take a spud and drive down slanting all around the tree and finally drive the bar down on one side and push down, and the tree and ball of earth will lay over on one side. Then take a spade and trim off the earth on the bottom of the block smooth, but a little full in the center. Back the wagon up at right angles with the tree close enough so that one end of a 14-foot plank will go under the tree and the other end will rest in the wagon. Then put a couple of boards about 4 feet long, with cleats nailed across at each end, under the tree with a piece of 1¼ inch gas-pipe between. Now tip the tree up, take a rope long enough so that when it is doubled it will go around the block of earth, and to this hitch a block and tackle and by keeping rollers between board and plank, three men can easily load a tree with the block of earth that will weight 1,000 pounds. When it is on the wagon leave one roller under the tree. In moving smaller trees, I dig them the same way but instead of putting a board under the tree, I take a stout gunny-sack and by tipping the tree over, I work the sack under and with a man at each corner, we can slide quite a large tree up a plank into a wagon and leave the canvas under until we get the tree unloaded.

I have transplanted Scotch pines this way, that would make from 16 to 18 inches growth from the center bed the same year, so I think they might be safely moved with much less earth attached, but they would have to be anchored to keep the wind from tipping them over until they were firmly rooted. Now is a good time to transplant evergreens. I have moved them after they had commenced to make a growth, but there is usually plenty of time before."

The Farm Orchard.

B. F. SMITH, WELLSVILLE, BEFORE THE WELLSVILLE FARMERS' INSTITUTE.

It is scarcely necessary in this age of the fruit-growing industry to go into an argument to show its advantages to the farmer. The fruit itself, and the healthfulness of it is sufficient proof. A treasure is added to every farm, be it large or small, that has an orchard on it. So, this leads me to consider the "Farm orchard and its care." On the size of the farm depends the size of the orchard; a forty-acre farm should have a three- or four-acre orchard; a farm of eighty acres should have seven or eight acres in orchard; and a farm of a hundred and sixty acres should have at least ten acres set aside for the family orchard and small fruits.

The farm home, be it ever so small or large, without an orchard, is unslightly, not finished, is not well balanced. Fruit-bearing trees, vines, plants, and flowering shrubs are among the Creator's best gifts to man for food and home adornment.

The orchard should be located as near the house as possible, for the convenience of the family. It should be fenced to itself, and cultivated annually with the tools best adapted to keep it clean.

As a rule, the farm orchard is the most neglected part of the farm. There is a wide difference in the flavor of apples grown in some old, neglected orchards and those grown in a well-kept orchard. Apples grown in an orchard that has been cultivated five or six times a year are twice the size, and look better, taste better, and sell for better prices. The orchard will live longer and your grandchildren may have the pleasure of eating apples grown on trees set by grandfather, when he was a young man.

I have eaten pears and apples from trees, when a boy, planted by my great-grandfather in Illinois. This matter of

cultivation must not be overlooked, for whatever size your farm may be, there will be seasons when your other crops may partially fail to meet your needs financially, then the orchard may be at its best, and then enable you to keep out of debt.

The farm orchard should embrace: (1) apples; (2) cherries; (3) peaches; (4) pears; (5) plums. While the orchard should all be in the same enclosure, each variety should be set together; they should not be mixed like forest-trees. Plant cherries nearest to the house, and back of the cherry-trees follow with peaches, then with plums and pears; and should you not have time to cultivate all the orchard, you can pass the plum and pear department.

Start head of apple-trees about three and a half to four feet from the ground, and peach-, cherry-, and pear-trees about two feet. Do some pruning every year. Do not allow a thick mass of tangled wood-growth in any orchard fruit-tree. One of the old rules for training the head of peach-trees is to cut off a third of the wood-growth every year for three years. Then after two or three years fruiting cut off the top, then start a new growth of bearing-wood. There should be no vacant places about the farm orchard. When a tree dies, replant the same variety that you lose, no matter what the cause is of the death of the tree. An orchard looks bad when there are great gaps here and there.

Among the crops that are best suited to grow among young trees are potatoes, rutabagas, beans, or any low-hoed crops. Corn, though a hoed crop, is too tall a growth, shading the trees too much.

All sown crops of small grain are bad, grass-seeds are worse, and meadows are ruinous. Repeated cultivation is an absolute necessity, from planting to fruiting.

Even after the orchard is at the age of full-bearing, it should be kept in a full state of cultivation.

There are hundreds of old orchards in the old counties in the Eastern part of this State that are bearing a few poor apples, that could be renovated and renewed with some of the vigor of their youth by cultivating and fertilizing the soil near each tree.

If any of our friends in this association have old orchards, or even a few trees of varieties that are worthy of having a few more years of useful necessity, try the experiment of renovation.

Begin this year by digging narrow radiating trenches five or six inches wide and the same depth, and within four feet of the trunk of the tree, directly out from it several feet. These trunks may be filled with a compost of barnyard and chicken-house manure. It should be done in the fall; but it can be done any time in winter or the spring season, and if we do not have a dry year, you will have a renovated tree ready to bear a revised edition of apples in 1907.

The farm orchard should have a succession of the earliest and the latest varieties of cherries, apples, and peaches, so that the table may be supplied from the beginning of the earliest to ripen to the latest fall apples. But the greater part of the orchard should be winter apples as the farmer has more time to sell the surplus, if he has any over the want of his own family.

In addition to the family orchard, every farmer should have a few grape-vines, currants, and gooseberries, and the best of the berry fruits, a strawberry patch and a raspberry patch. The berry season may be prolonged about six weeks by planting the earliest sort of strawberries and the latest kind of raspberries.

A well-kept orchard including a good-sized family berry-patch will be known through the neighborhood. Your neighbors will be more neighborly and more ready to exchange work, when one needs help. Should the time come when one desires to sell his farm and move to the city or a warmer climate, the attractive orchard and berry fruits will enable him to sell the farm for a higher price.

Many farmers look on the work in the fruit department of their farms as work from which they receive small returns for labor bestowed, but if they will persevere, and try to grow in love for the adornment of their homes, they will discover that the fruit department is a source of profit, not so much in the dollar as in the pleasure it will give their families in noting the growth of the trees, plants, vines, and flowers. It is so different from the ordinary farm-work that the time bestowed on the fruit department will be a season of rest to the body and growth to the soul.

Great American Desert Seeds
are best for general use, are grown in the very heart of the region once known as the Great American Desert, at an altitude of over two thousand feet above sea level and without irrigation. They are time tried and drouth tested and have proved producers of profitable crops of both grain and forage. Write for list of specialties and prices.

RATEKIN'S SEED CORN

"Pride of Nishna" is a golden yellow, 16 to 24 rows; deep grains and small cob; matures in 95 to 100 days; of great vitality and strength to resist drouth and other unfavorable conditions; outyields any other yellow corn in existence, making from 60 to 100 bushels per acre on good land. "Ratekin's Silver Mine," white, has greatest record for large yields of any white corn in the world—averaging 176 bushels per acre in seven states; full counterpart of Pride of Nishna.

Our Seed all grown from absolutely pure stock, especially for Seed purposes, is carefully selected, sorted, and butt and tip ends taken off, and is all graded to uniform size. Seed corn shelled and graded or in the ear. It is the kind that pays to plant. Change your seed and grow bigger and better crops. Price, \$1.35, shelled, sacked on board cars here. Our big Illustrated Catalog of all Farm and Garden Seeds is FREE if you mention this paper. Write for it today.

Address, RATEKIN'S SEED HOUSE, Shenandoah, Iowa.

BLACK LANGSHAN EGGS—From main flock, 15 for \$1.00; 100 for \$5.00; from pen, \$2.00 for 15. Mrs. Geo. W. King, Route 1, Solomon, Kansas.

WHITE PLYMOUTH ROCK EXCLUSIVELY—bred direct from a pen of U. R. Fishel's birds. Eggs for hatching from pen No. 1 \$2 per 15. Satisfaction guaranteed. J. A. Kauffman, Abilene, Kansas.

RARRED ROCK EGGS, \$3 per 100. Mrs. R. A. Galbraith, White City, Kansas.

WHITE PLYMOUTH ROCK EGGS from high-scoring show birds. \$1.50 per 15; \$2.50 per 30. Incubator eggs, \$5.00 per 100. M. R. turkey eggs, \$3.00 per 11. J. C. Bostwick, Route 2, Hoyt, Kansas.

GREAT RIG S. C. RUFF ORPINGTONS are the winter layers. Eggs \$1.50 per 15; \$2.50 per 30. Mrs. J. R. Cotton, Stark, Kans. 225 Main Street.

VANNATTA'S SINGLE COMB WHITE LEGHORNS—Great layers. Won \$100 Cash at World's Fair. Eggs for hatching. Catalogue free. E. E. Vannatta, Vandella, Mo.

ONE DOLLAR buys 15 eggs of either Rose Comb R. I. Reds or Barred Rocks from prize-winning stock at the college show. Mrs. A. J. Nicholson, Manhattan, Kans.

FOR SALE—All kinds of fancy pigeons, also Toulouse geese eggs at \$1 per sitting. Pekin and Rouen duck eggs, 18 for \$1. Muscovy duck eggs, 10 for \$1. Turkeys, Peacocks, Barred Rocks, Buff Cochins, Houdans, S. S. Hamburgs, Rhode Island Reds, Orpingtons, White Buff and brown Leghorns, White, Ruff and Silver-Jaced Wyandottes, Games, Golden Sea-bright Bantams, Pearl and White guineas, hunting dogs. Poultry eggs 15 for \$1. Write D. L. Bruen, Platte Center, Neb.

WHITE PLYMOUTH ROCKS—12 years breeder of choicest birds. Eggs \$1.50 per 15. Member American White, P. R. Club. J. E. Shinkle, Lakin, Kans.

BARRED ROCKS—40 cockerels. \$2 will buy a good one 50 pullets, \$1 each, sired by a pure Bradley cock. I have an orchard flock of 60 pullets mated with large, standard males, eggs \$1 per 15; \$5 per 100. A. C. Rait, R. R. 4, Junction City, Kans.

BARRED ROCK EGGS—Pen No. 1, \$1.50 per 15; pen No. 2, \$1 for 15. Mrs. W. A. Shreier, Argonia, Kans.

THE KANSAS FARMER

The Poultry Yard

Sweet Corn vs. Indian Corn as Poultry Feed.

EDITOR KANSAS FARMER:—Will you please give in the columns of your paper the relative value of sweet corn for poultry feed as compared with Indian corn. FRANK RANDLETT, JR. Elk County.

Answer:—Sweet corn is a more valuable feed than Indian corn for poultry as well as other stock. In an article on relative values of feeding stuff in the 15th biennial report of the Kansas State Board of Agriculture, Professor Cowgill of THE KANSAS FARMER has figured out that in 100 pounds of dent corn there are 7.8 of protein, 66.7 of carbohydrates, and 4.3 of fat, the value of these digestible nutrients being 50 cents, while in sweet corn there are 8.8 of protein, 63.7 of carbohydrates, and 7.0 of fat, a total value of 54 cents. He values protein at 3.37 per 100 pounds, carbohydrates at 0.32, and fat at 0.56. Sweet corn therefore is worth as a feeding material about 4 cents per 100 pounds more than dent corn.

Poultry Notes.

Kerosene is invaluable around a poultry-farm. It is a simple remedy for many troubles. Put it on the roosts frequently; it will keep the lice in check. Dilute it with sweet-oil (about one-third sweet-oil and two-thirds kerosene) and inject in nostrils, roof of mouth, and corners of eyes if your fowls have colds. Scaly legs are cured with it if properly applied, and an internal dose will help in many cases. An easy way to apply kerosene to the legs and feet of fowls to destroy the insects which cause the excrescences which sometimes appear is to fill an empty can two-thirds full of water, pour two or three tablespoonsfuls of kerosene in the water, and dip the feet and legs of the affected fowls therein. Two or three treatments will prove effective.

Hens take on fat in winter when the flock is being pushed along for selling and showing purposes. This retards the early production of eggs and especially of fertile eggs. The proper thing to do is to take off a large portion of their feed, enough to make them hustle to get enough to eat, and gradually work off the extra fat; and after this is done they will lay. After laying is fairly begun, they should be well and suitably fed to keep up the supply.

Millet seed should be a regular diet for the laying hens, and it should be kept on hand and in a convenient place for use. When you go into the yards and the hens run to you for food, which they will do even if fed frequently, scatter millet seed for them and let them seek the seed among straw or hay. Mustard seed, hemp seed, or any small seed will answer: a handful or two of seed is sufficient as it is intended, not so much as a part of the ration, as to keep the hens busy.

Turning the Eggs.

That turning the eggs in an incubator is an essential requisite of incubators is well known, but how to do it is not so clear. Some incubators have patent devices for turning the eggs by simply pulling a slide; others have an extra tray which is placed over the trayful of eggs and by reversing the trays, the eggs are all turned at once. Manufacturers of other machines claim that the better way to turn the eggs is by hand, handling each egg separately so as to be sure that all are turned each day.

Quite an interesting experiment along this line has just been completed at the experiment station of Cornell University. It was recognized that the old hen was a pretty reliable authority on this matter and, for the purposes of experimenting, four hens were set on fifteen eggs each. The eggs were marked by numbering them from one to fifteen, and a chart made of the location of the eggs each day. The results were surprising. In every instance it was found that each egg had been moved during the day. Not only were the eggs turned over every day, but their location in the nest was changed each day. For instance, No. 1 was in the front of the nest one day; the next day it would be in the middle or side of the nest; the next day again it would be in the back part of the nest. The same was true of all the other eggs in the nest. Of the twenty charts furnished for each day, not one of them showed the eggs in the same

position as any other day. This goes to prove that the patent devices for turning the eggs is not sufficient for successful incubation, for they simply turn the eggs over from one side to the other, but do not change their location in the trays. It would seem,

therefore, that the only proper way to turn the eggs in an incubator is to do it by hand, emulating the old hen as near as possible by changing the eggs from the ends and sides to the middle of the tray and vice versa, so as to make a constant change in the position of the eggs. By so doing all the eggs will have an even chance of hatching; for no matter how good the incubator may be, there are different degrees of temperature in it, the central portion and that nearest the lamp being the hotter and the outsides of the tray being the cooler portions. It behoves users of the modern incubator, therefore, to take a lesson in egg-turning from the lowly hen; for however proficient we may have become in the use of this modern invention, it goes without saying that the original incubator was an old hen, and that she knew all about the egg-turning business is fully demonstrated by the millions of progeny she has left behind her, all following the same old method that she taught her children, even unto the last generation. If it had not been done properly, our chickens to-day would have all been ducks.

Training for the Show-Room and Notes About Exhibition Poultry.

It is quite impossible to overestimate the value of the good training of fowls intended for the exhibition hall. For the training of these specimens, coops of the proper size, to conform to the size, shape and general make-up of the pens that are to be used in the show-room, should be selected. In this the fowls should be kept, first for a few hours at a time, and then finally confined therein for a day or two in succession until they become perfectly familiar with living within the coop, and lose all timidity from being confined therein and handled by those who have them in charge.

These fowls should also be taught not to become frightened at the presence of strangers, women, children, dogs, and animals that might possibly visit the exhibition hall where they are to be kept. If you have a lot of exhibition fowls so well trained for the coop that they will scarcely notice the approach of strangers, and will simply look somewhat excited at the presence of a barking dog, you may feel reasonably well assured that the specimens will stand the test of the disorder and surroundings of the exhibition hall.

Considerable trouble comes to those who fail to teach their fowls to stand naturally in the coops and to confront those who approach them rather than to turn from and cower into the corner of the coop. A specimen that will walk boldly up to the judge as he approaches the door of their coop and look at him as much as to say, "Well, here I am for your inspection," wins the admiration and confidence of the judge at once. Those that turn from him and do anything they can to avoid being handled seldom, if ever, gain the much-desired awards.

Teach your specimens that you send to the exhibition hall to be ever ready and on the alert for some one to open the coop door and handle them. Such a specimen is usually designated as a perfectly trained specimen, properly prepared for the examination of the judge and the eyes of the exhibitors. Such a one has many points in its favor, even before a partial examination for quality has been made. The first impression of the specimen in the coop has a lasting influence on the judge so long as he has this specimen under consideration.

For the final finishing touch for the show-room, be absolutely certain that the specimen is thoroughly clean and free from dirt or bad color of any kind. It is always best to thoroughly wash a specimen before it is sent to the show-room. No matter of what breed, variety, or color it may be, it will be greatly improved by a thorough washing. Even though this may not be done the comb and head parts should be thoroughly cleaned with luke-warm water and a sponge, the shanks and feet thoroughly washed and scrubbed with a good stiff brush, so that when the specimen is shown it will be as clean as it is possible to have it. This is called good condition, and nothing counts for more than this in close competition.

When the specimen is taken to the show-room, always see that it is carefully placed in the exhibition coop sev-

POULTRY BREEDERS' DIRECTORY.

BLACK LANGSHANS—Hens scoring 93 and upwards—headed by 2d and 4th prize cockerels from Kansas City 1906 show. Eggs, \$2 for 15; \$3.50 for thirty; special price by hundred. Can fill orders at once. Mrs. C. S. Cross, Fair Acres Farm, Emporia, Kansas.

BUFF PLYMOUTH ROCK EGGS for sitting, \$1.50 per 15. Jay S. Buck, Oskaloosa, Kansas.

BARRIED AND WHITE ROCK EGGS for hatching from choice birds; farm raised. White Rock eggs, 15 for \$1; 30 for \$1.50; 45 for \$2.65. Barred Rock eggs, 15 for 75 cents; 30 for \$1.45; 45 for \$2.10. D. S. Thompson, Welda, Kansas.

FOR SALE—White Plymouth Rock cockerels from high-scoring birds, and a few hens and pullets. Eggs for sale at reasonable price. Mrs. M. Luse, Nortonville, Kansas.

WHITE WYANDOTTE EGGS for sale: \$1.50 per 15. Only breed of birds kept. Mrs. John W. Smith, Lawrence, Kansas.

At Topeka 1906

Our Buff P. Rocks won all shape and color prizes awarded. Our first prize pullet scored 94 (cut 1 for injured eye). Our winning Houdans, White Plymouth Rocks, and White Wyandottes, are the same quality. We have very fine S. C. B. Leghorns. Judge Helmich cut our White Rock cock ¾ of a point for color of entire bird. Eggs from pens we hatch \$2 per 15; \$4 per 100. Standard Poultry Yards, Abilene, Kans.

White Plymouth Rocks
EXCLUSIVELY.

Good for Eggs, Good to Eat and Good to look at. W. P. Rocks hold the record for egg-laying over every other variety of fowl; eight pullets averaging 289 eggs each in one year. I have bred them exclusively for twelve years and have them scoring 94 to 96½, and as good as can be found anywhere. Eggs only \$2 per 15; \$5 per 45, and I prepay expense to any express office in the United States. Yards at residence, adjoining Washburn College. Address THOMAS OWEN, Sta. B, Topeka, Kans.

When writing advertisers, please mention this paper.

oral hours before it is to be judged. It is best to coop, water, and feed them the night before. Give them plenty to eat and drink at this time. Then, if they are to be judged in the morning, do not feed or water them any more until after they have been judged.

The time to begin to prepare for the exhibition hall is as soon as the young chicks commence to run about. Carefully look them over and examine them so as to become familiar with their contour and make-up. As the feathers begin to grow, the color and markings will quickly tell those of experience what the prospective qualities of those young chicks are, and by giving special care and attention to the best of them you will grow to maturity a lot of young fowls that will prove to be much better than they would have been if allowed to continue to go on in one flock, all receiving the same attention.

To make a show winner is not the work of a few days or weeks prior to sending them to the exhibition hall. It demands a series of long months of care and attention to bring them to the finest finish, and grow them to a proper size, strength, and muscular conformation that is demanded for the best. The present demands of the show-room do not accept medium quality as the best, so it is absolutely necessary to commence early in the game to make next winter's exhibition fowls.

Those who succeed never allow the grass to grow under their feet, as the saying is, but are continually on the watch to have and maintain a flock of exhibition fowls throughout, so that from year to year everything they possess is of that quality which makes the blue-ribbon winners. They never neglect the least or most simple thing they can do that adds to the comfort, growth, and handsome plumage of their stock. This is the price that must be paid for quality. The best of quality can not be had in any other way. If you desire to be successful in the show-room, gird on the armor of determination and continued efforts to have them as they should be.

The selection of the best is a problem that confronts every grow of standard-bred poultry. In the first place, the one who selects must be thoroughly conversant with the demands of the exhibition hall and the pranks and self-opinions of the judge, if you will. But above all things remember that you must be almost if not quite as expert at selecting the best before you leave home, as will be the judge who will pass upon them when they reach the show-room.

It is never too soon to begin the proper feeding of the specimens intended for the exhibition hall. These may be frequently chosen when between six or eight weeks old, providing the eye and experience of the selector is equal to the occasion. Such ability only comes after long experience. The reason that the older breeders are the most successful in the exhibition hall is because they have studied the problem, and improve by their experience gained through hard knocks and long-continued care of their poultry at home and in the exhibition hall.

Often we are tempted to select but a few in preparation for the exhibition hall. It is better by far that you should select all the likely specimens at first and colonize them to themselves, and as they improve and grow older, select those of the poorest quality and ship them off for the filling of orders. This will leave in your possession the cream of all you have grown that season, and it is never a difficult problem to sell the best; never be in a hurry to do this, for if you will succeed as an exhibitor and breeder the following season you can not possess too much of the highest quality for your matings from which to grow your future stock.

Passengers east from Chicago to Fort Wayne, Findlay, Fostoria, Cleveland, Erie, Buffalo, New York City, Boston, and all points east, will consult their interests and find advantage in selecting the Nickel Plate road east from Chicago. Three through trains are run daily with through day-coaches to New York City, and modern Pullman sleeping-cars to destination. Rates always the lowest, and no excess fares are charged on any train, for any part of the journey. Modern dining-car service, with individual club meals, ranging in price from 35 cents to One Dollar; also meals à la carte. NEW BOOK**JUST ISSUED****SUCCESSFUL FRUIT CULTURE**

A Practical Guide to the Cultivation and Propagation of Fruits.

By SAMUEL T. MAYNARD,
Formerly Professor of Horticulture at the Massachusetts Agricultural College.

This book is written from the standpoint of the practical fruit grower; it is up to date in every particular, and covers the entire practice of fruit culture. It gives in plain, practical language, descriptions of such varieties as are most in demand in our markets, and the methods practiced by the most successful cultivators of many sections of the country. Separate chapters are devoted to the apple, pear, peach, apricot and nectarine, plum, cherry, quince, mulberry, grape, blackberry, raspberry, cranberry, strawberry, blueberry, huckleberry, subtropical fruits, propagation of fruit trees and plants, fruit growing under glass, insect pests and fungous diseases. The chapter on the apple is particularly comprehensive and complete, forming a monograph in itself. The chapter on forcing peaches, grapes, strawberries, and other fruits, describes the most recent methods of the present day, and is the most recent practical treatise on this important industry.

Illustrated. 5x7 inches. 265 pages. Cloth. Price, postpaid, \$1.00.

TOPEKA, KANSAS

Dairy Interests

Developing a Cow.

When we stop to think that all kinds and breeds of cattle undoubtedly originated from the same pair that the good Lord created at the beginning, we begin to realize what an artificial production the cattle of to-day are, how that environment, conditions, and tastes of men have developed them along different lines, until to-day we have many different breeds with characteristics peculiar to each breed, and each breeding true to the type, color, and conformation of its own peculiar breed. Of course this was the work of ages, and requires a great deal of skill, patience, and perseverance; but it shows what can be accomplished if we have a definite aim in view.

Cows, like men, are good or bad oftentimes because of their environment, bringing-up, and education. We look for and expect men to be good if brought up in good and religious families and communities. I have often heard it said, "give me the first six years of a child's life and I will tell you with a certainty what the future of that child's life will be." So I believe that the conditions under which an animal is reared determines in a large measure her future usefulness or uselessness.

As with men the parentage is of great value and we look for and have good reason to expect cows to be better cows from a long line of productive ancestry, so this then is the stepping-stone in the developing of a dairy cow.

A profitable cow in my estimation is one that can produce in a year, or still better a series of years, a good maximum yield of butter at a cost that will yield a good profit to her owner and also produce a strong healthy calf each year. One of the requisites then in securing the sire for the head of the herd is not only to see that he is from a productive strain, but from a family of regular breeders also, because he not only reproduces his good qualities, but often intensifies his weak points as well. See that he is as near perfect in conformation and dairy makeup as possible, for with all the care we may exercise in the mating of our animals, some faulty ones will develop that we had not figured on; so if we have looked well to this end, to see that the sire is right, and that the dams we are to use for foundation are right, we have gone a long way toward their development.

I recently heard of a breeder who examined every little heifer calf that came into the herd and if it did not have so many developed teeth and the udder and teats just so well developed, it was knocked in the head. I want to say that if we had practiced such a method in our herd, we should have slaughtered some of our most valuable animals, for we have found that all heifers do not develop alike; some are veritable little cows at six months old, while others do not develop real good cow-qualities until three or four years of age.

Calves should be fed in such a way as not to impair their early growth or digestion for later on we are going to ask them to take care of a lot of feed so that they may develop and be profitable animals; but if fed and cared for in a careless and harmful manner, their digestive faculties become impaired and they simply say "We can't do it."

I still believe that heifers should not freshen too young; if allowed to drop their first calf at from twenty-eight to thirty months of age; they will get a little more growth and strength and we believe their digestive abilities are also strengthened.

There are many things that enter into the development of the dairy cow, and possibly if any one was dropped out the best of results could not be obtained. The man that uses that part of his body above his ears the most freely usually succeeds best.

We have come to believe that a large part is due to the feed end of the question; the organs of digestion, like the other organs and muscles of the body, are developed best by constant use. The breeder that through neglect has not provided in some way for the emergencies that always come is shortsighted. We all know that when a cow once shrinks in her milk how hard it is to get her back, and quite often it is impossible even with the best of feed; so it stands us in hand to provide in some way for these times and either have some soiling crops growing or enough silage stored up to supplement the short pasture of summer, also to

supply succulent feed for winter use.

I believe there is such a thing as compelling success. Every breeder should have such a complete understanding of his business and the individual needs of each animal, that there is no time in the year when she may not have an abundance of good, rich, juicy foods, best suited for milk-production.

The successful development of cows rests largely on the breeder's equipment. Loretta D's, Yeksa Sunbeams or Shadybrook Gerbans do not come by "happenstance." They are the result of equipment. The important requisites for the developing of a good dairy cow are (1) right breeding; (2) right feeding; (3) right care.

One man in writing of cows says: "The cow does not make her milk from running brooks or sunny skies." To be sure she does not, yet I believe the water and the sunshine are quite important factors in the best milk-production. Convenience for watering and at the right temperature means something, and the pleasantly situated cow-stable with plenty of windows for the sun to shine through means something; good, warm, clean, well-ventilated stables, balanced rations, kindness, patience, watchfulness, "sticktoitiveness," all mean something.—F. H. Scribner, Rosendale, Wis., in Jersey Bulletin.

Location of Barn and Care of Yard.

In the production of clean milk, no one thing is of more importance than keeping the cows out of the mud. Many yards into which dairy cows are turned each day for their drink and exercise are knee-deep with mud and manure during the winter and spring, if not nearly the entire year. In summer when the cows are on pasture, they would keep comparatively clean were they not obliged to wade through a filthy yard in going to the stable.

In locating a dairy-barn care should be taken to have a gentle slope from the barn in at least one direction, affording good natural drainage for both barn and yard. If the barn is already built and poorly located, drainage and grading will do much to remedy the evil. In most cases it would take but a small amount of labor with plow and scraper, when the ground is in suitable condition to handle, to give the surface of the yard a slope from the barn sufficient to carry off the surface water. Even if dirt has to be hauled in from outside the yard to accomplish this, it will not be expensive. Tile drainage alone under a yard is not sufficient, as the tramping of the cattle soon puddles the surface, preventing the water from passing down to the tile.

After the grading is done, the yard should be covered with gravel or cinders. By putting the coarser in the bottom and the finer on top, a good hard yard can be obtained and at a comparatively small expense where material of this kind is available. If this can not all be done in one year, it is of the utmost importance that a beginning be made by grading and graveling a portion of the yard next the barn, so that the cows may have some place on which to get out of the mud and filth. By grading a part of the yard each year and applying a thick coat of gravel or cinders to the graded part, the entire yard will, in a few years, be in good condition. When gravel does not contain enough clay to pack hard, a small amount of clay should be mixed with the top layer. It will then form a firm surface.

A portion of the yard should be bedded, thus affording the cows a place to lie in the open air on pleasant days. If straw is scarce, the cleanest of the soiled bedding from the stable will answer this purpose. When the straw and manure on this bedded portion of the yard become too deep and soft, they should be hauled into the field and the bedding commenced again on the solid yard.

It is advisable to haul the manure directly to the field from the barn, but if this is not feasible, it should be removed at least 100 feet from the barn. In no case should it be allowed to accumulate against or near the dairy-barn, and no swine-pen should be nearer than 200 feet on account of the odors being readily absorbed by the milk.

W. J. FRASER.

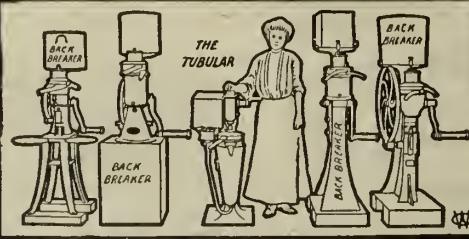

Western Farmers and Western Butter.

The time was when Western butter had a poor place in the market. Gathered cream butter was often pretty poor stuff. Methods of manufacture changed, and the time was when Western butter commanded top price. This was when the farmer brought the whole sweet milk to the factory and the operator made the cream as well as

TUBULAR--or "Back Breaker?"

When you see the waist low Tubular you can't be driven into buying a back-breaking, "bucket bowl" separator. **Can and crank are just the right height on the Tubular.** Here is the largest Dairy Tubular along side four "back breakers." The girl with her hand on the Tubular is 5 feet, 4 inches tall. This is an exact reproduction from a photograph. **Which kind for you?** Makers of "back breakers" try to get their cans low by setting the cranks low. **High cans** break your back backward—**low cranks** break it forward. Unless you are a double jointed giant, you'll find a high can is no joke. To show you how high these "back breaker" cans really are, when the machines are set high enough to turn easily, we raised these "back breakers" 'til their crank axles were level with the Tubular crank axle. "Back breaker" makers don't like this picture—it's too true. They try to squirm out of it. You wouldn't like turning cranks as low as "back breaker" makers put them.

The low can is only one of many advantages Dairy Tubulars have over all others. Dairy Tubular bowls are simple—"back breakers" are complicated. Tubulars are self-oiling—no oil holes to fill up. "Back breakers" are oil drippers and oil wasters. To learn a lot more about Tubulars, write today for catalog N-165.

Cream is Cash

AT

The largest exclusive Cream Butter Factory in the World

NO WAITING

NO DELAY

NO RISK

NO UNCERTAINTY

NO ANXIETY.

Cream shipped to us is paid for immediately.

Our motto is:

CORRECT WEIGHT,

HONEST TEST,

and the highest possible price for butter-fat.

Under this banner we have established an enormous business. Through a continuation of this policy, we expect to increase our business each month.

A cordial welcome awaits every enterprising milk-producer, who appreciates having his product handled economically so as to get the greatest returns and that in **Cash**.

It's a pleasure to answer letters. Will be glad to hear from you.

Very respectfully,

BLUE VALLEY CREAMERY CO.,
ST. JOSEPH, MISSOURI.

Peerless Cream Separators

Reasons Why the PEERLESS is the Best

1st—Twice the capacity of any other bowl. That is to say two times smaller than any other bowl of equal capacity.

2d—Compound feature, two bowls in one, hollow bowl, and disk bowl, combining all the features of the tubular and disk machines.

3rd—Enclosed frame. Free from dust. Injury resulting from machine impossible.

4th—Perfectly noiseless.

5th—Heavy enough and strong enough to lift a box car, which insures durability.

6th—The bushings made of phosphor bronze—the most serviceable material for the purpose. Fitted and guaranteed to be accurate to $\frac{1}{2}$ of 1-1000 of an inch.

7th—Every journal bushed with brass or phosphor bronze. This fact together with the fine adjustment described above, accounts for the light draft of the Peerless machine. Each bushing is made in duplicate and interchangeable and if at any time they show wear they can be replaced at small cost.

8th—at normal temperature the skimmed milk will always show less than 5-100 of 1 per cent of butter fat, and generally less than 1-100 of 1 per cent butter fat. PEERLESS CREAM SEPARATORS are guaranteed to anybody—everybody, anywhere—everywhere.

the butter. Now, the time is when the buyer wishes to be shown the goods if they are from the West. There is no dodging the fact that a very large per cent of the butter made in our Western creameries is poor, poor because the cream from which it is made was poor. Seeing this, it has been the pleasure of many writers to take a whack at the farmer, holding him responsible for all this trouble and loss. The truth of the matter is, the separator agent and the creamery managers are more to blame than the farmer for the poor cream that the farmers send in.

There is no question about the hand-separator being an economical instrument for the farmer who sells cream. So long as this remains true there is no use in trying to keep him from using one. Neither should we try, for anything which makes more money for the producer will encourage him to stay in the business. This insures continuance of work for the manufacturer and greater business. Moreover, it is both theoretically and practically possible to make just as good butter from hand-separator cream as from power-separator cream. Yet the fact remains that such good butter is not usually made. The farmer has been scolded and thoroughly "lambasted" for not taking better care of his cream, with what result? Poor cream continues to come, and bad butter continues to go.

The hand-separator agents who have taught and are still teaching the farmers that once or twice a week is often enough to wash their particular make of machine should be the first men laid out, and with them the company they represent for allowing them to do this thing which in most cases is against the orders of the house. So much has been said on this point and the agents themselves know the truth so well that I was surprised at learning from one whose word can not be questioned, that at the implement dealers' convention, at Kansas City, Mo., this company was heard to tell a farmer that his machine was "washed with the crank." We all know, and he knew, that any and all machines or tools used about milk must be well washed if first class goods are to be produced, or, in any other words, this man then and there sold his honor as an honest man for the price of his commission on a cream-separator. For a temporary personal gain he jeopardizes the whole industry. Is it not al-

most time the State dairy inspectors were placed on the trail of these men, and at least publicly expose them and their company when such criminal nearsightedness is practiced. Their teaching is more filthy and a greater source of evil than the farmer's dirty barn.

The second man to be slain is the creamery manager, for he, though howling most lustily, is, after all, the chief offender. He lies in accepting at first-class prices cream which no mortal man could make into good butter. In fact, the competition among the creameries of the West has been too keen for the permanent welfare of any, even the producers. During the past two years their mad chase for more business has led all to take any old stuff named cream and, what is worse, pay a good cream price for it. There is in man a trait which keeps him from putting into any article any more work than is necessary to get the price out of it, and why should he? Last summer the creamery companies sent out personal appeals and instructions by the car-load to the farmers to take better care of the cream, but to no use.

In a little town in Eastern Kansas one day last summer a farmer brought in a can of ideal cream. This man was well known as a neat farmer. While he stood there talking to the station operator a slovenly, unkempt, dirty farmer came in with some cream as badly off flavor as himself; one cream was fit for the table and one fit for the sewer, yet the same price was paid for each. One man went away contented in his dirt, and the other rightfully disgusted.

Inspection is often recommended and it might do some good, but in my opinion such inspection should not be made. The people who buy the goods should do their own inspecting and grading. When the farmer sells smutty wheat or musty corn or scabby potatoes or rusty apples or stale eggs, he gets a price according to the value of goods delivered, and this without any official inspection.

Healthy competition to keep up prices is a good thing, but a warlike competition to get stuff at any cost may prove worse than no competition, even to the producer. If quality has value, as we all know it has, it should be paid for. It is now up to managers of the creameries, both large and small, to grade cream in fact as well as in words, and make a good substantial difference between first-grade and second-grade stuff. When the creameries thus give backing to their own words concerning the value of better cream, the farmers will give that extra care necessary to have good cream. A difference of four cents per pound fat between first and second grades and two cents between second and third grades would seem to be just and have the desired effect.

All creameries, both large and small, should agree to live up to these or some similar rules, and then do it. Western butter is now standing trial; the creamery managers are the jurors who will decide its fate.—R. M. Washburn, State Dairy Commissioner of Missouri.

GALVANIZED IRON SILEO.

EDITOR KANSAS FARMER:—I am a subscriber of your paper and consider it worth more as a farm paper than any I have ever taken.

I am starting in the dairy business and need all the advice I can get. I have 25 head of cows, which number of course necessitates a large quantity of feed. Since receiving your paper and reading the favorable discussion on silos, I have decided to make one to use principally in storing alfalfa hay.

As lumber is very high at present I feel as though it would cost too much to experiment with it, so would ask your advice about using galvanized iron—about 22 inch iron—which I can obtain for 3½ cents per pound. A silo 16 feet in diameter and 20 feet deep will cost about \$60 if I do my own work.

Do you think if I put three coats of paint on the inside that the ensilage would effect the iron? Would also like to know whether alfalfa has to be chopped up to put into a silo? Also what make of gasoline engine would you advise for general farm use?

Would be pleased to receive a bulletin on dairying. P. M. FORD.

Leavenworth County.

Three coats of paint on the inside of the galvanized iron will prevent it from rusting or corroding as long as the paint lasts. Care must be taken in filling the silo to prevent scraping or rubbing, the inside of the silo should be inspected, and whatever particles

DE LAVAL LEADS IN SEPARATOR IMPROVEMENTS

As the first original centrifugal cream separators the DE LAVAL machines have led in every stage of separator improvement and development. From year to year DE LAVAL leadership has been strengthened until today manufacturers of other separators are compelled to constantly create new "talking" points for their machines or else go out of business. First one and then another advertise some new and wonderful "improvement," or else perhaps some asserted to be entirely "new" machine is placed on the market. A close investigation, however, soon discloses the fact that these "improvements" are but schemes to bolster up a failing business and further catch the inexperienced buyer. A few hundred machines are sold on the strength of such claims, but their purpose is soon found out, and then we find the same manufacturers again advertising some other "new" and wonderful but equally worthless "improvement" with which to attract the unwary buyer. Hence it behoves the inexperienced buyer to investigate well before selecting a separator. The 1906 DE LAVAL machines are even further ahead of all others in mechanical construction than ever before. Their skimming is absolutely complete, their capacities are greater, they turn easier, and their lasting qualities are beyond comparison. A DE LAVAL catalogue, gladly sent upon request, will best explain the WHYS and WHEREFORES of DE LAVAL superiority to other separators. Send for it to-day.

Dairy Talks by the EMPIRE Dairy Maid

How Much Ought You Spend

Each Year For Separator Repairs? Well, It All Depends

upon what separator you buy.

A complicated separator, with many intricate parts and a lot of do-funny fixin's costs more for repairs than it is worth. A cheap, poorly constructed separator—made for sale rather than service—not only gives a lot of trouble and annoyance, but also is a constant drain upon your profits.

Isn't it foolish to buy any separator until you are sure it won't eat up all your profits in repair bills?

Of course it is. But, if you keep cows, you must have a cream separator—just as you must have a plow on the farm and a cook stove in the house.

The thing to do is to use good business judgment—in other words, plain common sense—in selecting your separator.

What is it that makes trouble in machinery of any kind?

Why, intricate, complicated parts. It's

Cleveland Cream Separator

Direct to You
30 Days Approval Test

Easy Running:—In the Cleveland Separator this isn't an empty claim. The whole thing is summed up in an honest, easy to prove reason. The Cleveland is the only ball-bearing separator made.

Easy Cleaning:—The Cleveland has fewest parts: a skinning device is made of aluminum. Investigate. You will find this metal is non-corrosive, non-poisonous, milk cannot stick to it and there is no coating to wear off. We prove these things.

Long Life:—The Cleveland has the fewest parts of any separator made and gets results at the slowest speed. Parts can't wear out that are not there. The Cleveland is a guaranteed perfect Skinner.

How We Sell:—To you from our own factory. The only manufacturers making a high grade separator and selling it at a fair, square price and a fair, square plan. No money in advance. No note to sign. No fine of any kind. The catalog tells you. Write for it.

of paint have been removed, fresh paint should be applied. Alfalfa should be run through the feed-cutter the same as corn or any other grain before putting into the silo. It will then pack much better and exclude the air, which is an important factor in the preservation of ensilage.

We have used only two gasoline engines at the Experiment Station, and both have proven very efficient. One is manufactured by the International Harvester Co., and the other, the "Eli," is manufactured by the John Deere Plow Co. I am sending you a bulletin on dairying.

C. W. MELICK.

Milking Machine a Success.

The writer had the pleasure of viewing the working of a milking-machine erected on W. B. Barton's farm in Dalton, Mass.

This plant, as well as another erected on the farm of S. A. Hickox, of Williamstown, has been erected as a demonstrating plant in this section. It is stated that there are now more than 200 of these machines in use in the large dairies of New York State.

The territory of Massachusetts has been assigned to local parties who are soon to incorporate. Dalton, Mass., has the honor of being the demonstrating point of the first successful milking-machine ever used in New England.

I arrived at the farm when the milking-machine was about to be started. The power used is an International gasoline engine, three-horsepower (although this is in excess of power required). A pipe-line is put up above the stanchions over the cows. From this pipe a rubber tube is attached to a small instrument on the lid of the can, which causes the pulsations of suction similar to the action of a calf sucking. The milkers work very rapidly, and if proper sized teat-cups are used to fit the different sized teats, it does the milking very thoroughly. I personally stripped two cows after they had been milked by the machine, and did not get any more milk than would be gotten after any milker by hand. With such a plant one man can milk from 30 to 40 cows an hour.

The washing arrangement is very simple; the same rubber tube used in connecting milkers with the suction-pipe is attached to a suction-pipe in the wash-room. The teat-cups are held first in cold water, and then in scalding water, and by the same action that does the milking the water is sucked through the tubes into the can, thoroughly cleansing and sterilizing every part.

If the machine can be placed on the market at a reasonable cost to the dairyman, it is bound to work a great revolution in the dairy business, as it is getting more difficult to get help with the patience and cleanliness necessary in dairying. The milk extracted by the machine is absolutely clean as there is no way in which dirt or even odors can contaminate it, as the milk from the time it leaves the udders is held in air-tight cans until it is carried to the milk-room to be aerated. I have every confidence that this machine is a success.—John B. Watson, Becket, Mass., in Jersey Bulletin.

The Book You Want.

Every owner of a milch cow should send to-day for a little book, "More Milk Book," issued by the Omega Separator Co. It answers hundreds of questions about the dairy which will be of interest and value to you, such as How to keep odors from milk.

At what age the cow is most profitable.

How to make the best butter from separator cream.

How to care for separator cream. How to wash butter for best results. How to score butter. What makes white specks in butter. How to get the most profit from skim-milk.

What cream-separator will give you the best results.

In writing for this book, kindly tell how many cows you milk, and whether you have a cream-separator or not. Address, Omega Separator Co., 18 Concord St., Lansing, Mich.

Catching Pickpockets.

The Sharples Separator Co., of West Chester, Pa., has a man in almost every town who makes it his business to catch pickpockets. Strangely enough, these pickpockets are always caught robbing themselves—and are always farmers or dairymen. The Sharples Separator Company's men do not send these convicted self pickpockets to jail, but show them how to make more money. They prove to them that, if they have not a famous Sharples Tubular Cream-Separator, they are picking out of their own pockets one-third to one-half the profits they should make from their milk—that they are, in fact, losing one-third to one-half their cream. These men can convict you of robbing yourself. They will do it, either by lending you a Tubular for a free trial, or by skimming for you, free, a batch of milk you have already skimmed with pans or cans, and taking out of that milk, which you think is skimmed clean, the cream you have left in it. This proof won't cost you one cent, but will help you increase your butter money from one and one-

third to double what you now make. All you need do, to find out how much cream your pans or cans lose, is to borrow a Tubular from the agent for a free trial, or take a batch of skimmed-milk to the nearest Tubular agent. The result will surprise you, cost you nothing, and put money in your pocket. We suggest that you write The Sharples Separator Co., of West Chester, Pa., about this, at the same time asking them for Catalogue No. N-165.

Dairy experts keep careful records of the performance of each cow. Many have realized the want of suitable blanks for this purpose. A Shawnee County dairyman has prepared and had printed a blank for a herd of 25 cows for one week. At the end of the week another blank is substituted. If one has only 5 cows the blank will answer for five weeks. THE KANSAS FARMER has a supply of these blanks on tough writing paper. They will be sent postage prepaid at the following prices:

One copy, 5 cents; six copies, 25 cents; twelve copies, 40 cents; twenty-five copies, 75 cents; fifty copies, \$1.25; 100 copies, \$2.00.

Miscellany

On to California.

The great opportunity for permanent investment that has promise of good profit is assured by the possibilities of irrigation. The most prominent institution in the United States at the present time is the Fresno Irrigated Farms Co., who have done some forceful advertising in THE KANSAS FARMER during the past few weeks, presenting some of the most striking advertisements that ever appeared in a farm journal in the line of realty advertising.

This week they offer some exceedingly attractive inducements to our readers who will inform themselves on the subjects mentioned in their page announcements. The prizes offered this week aggregate in value \$1,325.00. The first prize article will be published in this paper. THE KANSAS FARMER representative who is personally familiar with this prospect, says: "I am able to state to you that the parties interested in the Fresno Irrigated Farms Co. are of the very highest financial and personal standing in California and they will absolutely carry out the provisions of this competition."

Early Spring Work.

Conditions in a general way are very favorable for another bumper crop all over the semi-arid West, providing man does his part in utilizing these conditions.

Nature has been very kind to us for some time. She may conclude, however, that we do not appreciate her liberality and place us a little more on our resources, in which case it would stand us in hand to husband her bountiful gifts when possible. Our soils as a rule are now filled with moisture to a liberal depth; in short the greater part of the farm lands of Nebraska and much in adjoining States has now (March 6) sufficient moisture stored below the surface to guarantee or assure a good yield of winter wheat and an average crop of corn in face of the repetition of any drought we have ever had, if the farmer will but husband this moisture as he should and can do, together with the proper fitting of the soil and care of the crops while growing.

We are well aware that many a skeptic may read this and say "impossible." Nevertheless, we know we have not overdrawn in the statements. A quarter of a century of careful study and observation and experiments in many parts of this country have proved this over and over again.

The first step to accomplish this all-important result is to get over the surface of your fields with disk, Acme, or common harrow at the earliest possible time and thoroughly loosen it, forming a soil-mulch, for three reasons or purposes: to stop the evaporation of moisture, to prevent the forming of a crust, and admit the air into the soil below.

A few people are beginning to realize to some degree the importance of this work, not that they know just what the effect is or just why the yield is so materially increased, but they have seen the result through practical demonstrations. But we must leave the "why" out of this article, as space will not permit.

Your winter wheat-fields should be harrowed, for the above reason. Most fields of wheat are now too thick by 50 to 100 per cent and should be thinned to some degree. In such a case and where the sub-surface or root-bed has been fined and firmed in the fitting for the crop, the harrow should set fairly straight, that it may do good to the surface. In case the seeding has been late and the subsoil is more or less

HE ATTENDS TO BUSINESS

who goes straight to work to cure

Hurts, Sprains, Bruises

by the use of

St. Jacobs Oil

and saves time, money and gets out of misery quickly.

It Acts Like Magic. Price, 25c. and 50c.

loose and the plant less strongly rooted, then more care must be given as to the slant of the harrow-teeth and the severity or depth of loosening.

One statement may be sufficient to direct the farmer to quite a degree in this work, viz: Use every precaution possible to have the surface of your soil in your small-grain fields free from crust and with a loose mulch when the foliage or leaves of the small grain reach that stage of growth where they cover the surface.

DISKING.

Disk your ground early, especially that portion you expect to put to corn. To the average farmer who has not given thought and study to this question it may seem like a waste of time to double-disk a piece of ground six to ten weeks before planting time, but this is of vital importance, not only for the purpose of holding the moisture now in the soil, but to utilize the effect of the warm days in early spring. The soil beneath a loose surface becomes warm much quicker than if left crushed. The warming of this soil is very important in two ways. The first and most important advantage is the development of bacteria and nitrates, which require both moisture and heat. The second is the warming of the soil so that we may promote rapid, healthy germination of the seed when planted. One point we can not put too much stress upon, and that is to never let your soil dry out. We frequently hear people talk of the soils being very fertile. What is the advantage of owning fertile soil and then persist in so handling this soil that the fertility is never available? Pardon the assertion, but this is really what the average farmer does, and the most serious of all things is to let the soil dry out or become dried to that degree that the development of nitrates or bacteria ceases. The next most serious idea is to allow a crust to form on the surface and shut the air from below. Much has been said about breaking the crust or preventing it forming by cultivation to prevent the loss of moisture. This is truly important; but the conservation of moisture is but little more important than the free access of the air into the soil—not in volumes, but through the pores in the fine, firm, moist soil.

PLOWING.

Just a word on plowing. If you desire a good crop, and we have every reason to believe you do, then don't plow your fields dry or nearly dry, for you can not get a physical or mechanical condition of the seed- or root-bed that can possibly bring a good crop from a field plowed dry. The soil should be moist—not wet. Watch the furrow as it rolls over. If the particles readily separate all through, then

JUST ISSUED

Farm Grasses of the United States

By W. J. SPILLMAN

Agrostologist, U. S. Department of Agriculture

An intensely practical discussion of the farm grasses of the United States of America is presented in this volume. It is essentially a resume of the experience of American farmers with grasses, and it is safe to say that no other work has covered the ground so thoroughly. No attempt has been made to give a connected account of all the grasses known in this country, but the aim has been rather to give just the information which a farmer wants about all those grasses that have an actual standing on American farms. The whole subject is considered entirely from the standpoint of the farmer. One of the most valuable features of the book is the maps showing, at a glance, the distribution of every important grass in the United States; and the reasons for the peculiarities in this distribution are fully brought out. The principal chapters treat on the grass crop as a whole and the relation of grass culture to agricultural prosperity, meadows and pastures, the seed and its impurities; the bluegrasses; millets; southern grasses; redtop and orchard grass; bromegrass; grasses for special conditions; haying machinery and implements; insects and fungi injurious to grasses, etc., etc. The methods followed on some pre-eminently successful farms are described in detail, and their application to grass lands throughout the country is discussed. The discussion of each grass is proportional to its importance on American farms.

This book represents the judgment of a farmer of long experience and wide observations regarding the plan in agriculture of every grass of any importance in American farming. In its preparation its use as a text book in schools as well as a manual of reference for the actual farmer has constantly been kept in mind. The book is most conveniently arranged and splendidly indexed, so that the reader may find any subject at a glance. Illustrated, 5x7 inches, 248 pages. Cloth. Price, postpaid, \$1.00.

KANSAS

GIFFORD'S SHORTHORNS 22D ANNUAL SALE FROM ELMWOOD FARM

WILL BE HELD AT
Manhattan, Kans., on April 25, 1906, in the Sale Pavilion

20 extra good red Scotch-topped bulls from 12 to 20 months old, all in fine condition, sired by Red Gauntlet 3d 147509, a Crnickshank bull of exceptional quality. Twenty of the best young cows and heifers ever offered from the herd, all bred to Scotch bulls Senator Bruce 226244 and Cordelia's Knight 161501 (the best son of Red Knight). Cordelia's Knight will be included in the sale, is sound and all right, and a great breeder. This will be the place to get a choice bull or a few good cows to start with. Come to the sale and bring your friends. For a catalogue address

WAKEFIELD, KANSAS.

you have the ideal condition. If too wet or too dry, it will not do this. Therefore, precede the plow by disking or harrowing, to keep the soil moist.

Plow about seven inches and follow as closely to the plow as possible with the sub-surface planter. At least, don't leave a field at noon without packing what was plowed before noon, and the same at night; and don't leave the field at night without harrowing all you have plowed during the day.

Not until the farmer realizes fully and clearly the vital importance of thorough fitting and really what thorough or proper fitting is, will he ever realize how much fertility he has in his soil or what an enormous crop his fertile soil can produce.—H. W. Campbell, in Nebraska Farmer.

At the end of Washington's administration there were sixteen States in the Union. There was also the "Northwest Territory," as it was called, not yet organized into States—the whole wide region between the Ohio and Mississippi rivers, from which slavery had been forever excluded by a law passed by Congress in 1787. The first census of the nation was taken in 1790; and the population was about four millions (3,929,214). The population March 1, 1906, according to the estimate of the Treasury Department, was 84,194,000.

Coffee was discovered in 1285 by a dervish named Hadji Omar, a native of the town of Mocha—hence the familiar name. Hadji Omar, lost in an Arabian desert, was dying of hunger, when he discovered some small, round berries. On trying to eat them he found, to his disgust, that they were extremely bitter. Then he tried roasting them, and finally steeped a few thus roasted in water. Naturally, this was coffee, and, though of the worst description, so agreeable did Hadji Omar find it that as soon as he could make his way back to his native town, he introduced this new drink to the wise men of the city. So well pleased were they with it that the dervish was made a saint.

Balboa crossed the Isthmus of Darien in 1513, and from the summit of the Andes beheld the wide expanse of the Pacific Ocean. Wading into its waters with his naked sword in one hand and the banner of Castile in the other, he solemnly declared that the ocean, and all the shores which it might touch, belonged to the crown of Spain forever.

Repeated experiment has proved that the practice of applying large quantities of manure to the acre on a limited space, making it necessary to leave much of the land unmanured, does not pay. Many farmers never apply less than twenty tons of stable manure to the acre, saying that they prefer to do well what they do and let the remainder of the land take its chances. Twenty tons of manure on one acre, plowed under for a spring crop, makes the soil richer for years—no doubt about that—but it will not improve the productive power of a farm nearly so much as the same amount of manure.

used as a top dressing on three acres, provided clover is grown with this supply of plant-food. It is poor farming to keep up a few acres near the barn with the entire supply of stable fertilizer and let thin fields fail to make profitable crops. Manure crops are the chief dependence on a majority of farms and enough farm manure should be used to assist thin soils wherever found, so that all fields may increase their supply of vegetable matter and be permanently improved and then any additional supply can be safely used to enrich the poor field from which one wants a banner crop.—Epitomist.

The Use of Lemons.

A correspondent some time ago furnished the following recipe as a new cure for consumption: "Put a dozen whole lemons in cold water and boil until soft (not too soft), roll and squeeze until all the juice is extracted, sweeten the juice enough to be palatable, and drink. Use as many as a dozen a day. Should they cause pain or looseness of the bowels, lessen the quantity, and use five or six a day until better, then begin and use a dozen again. By the time you have used five or six dozen you will begin to gain strength and have an appetite. Of course, as you get better you need not use so many. Follow these directions, and we know you will never regret it if there is any help for you. Only keep it up faithfully. We know of two cases where both the patients were given up by the physicians, and were in the last stages of consumption, yet both were cured by using lemons according to directions we have stated. One lady in particular was bed-ridden, and very low, had tried everything that money could procure, but all in vain, when, to please a friend, she was persuaded to use them in February, and in April she weighed 140 pounds. She is a strong woman to-day, and likely to live as long as any of us. When people feel the need of an acid, if they would let vinegar alone, and use lemons or sour apples, they would feel just as well satisfied, and receive no injury." And a suggestion may not come amiss as to a good plan when lemons are cheap. A person should in those times purchase several dozen at once, and prepare them for use in the warm week days of spring and summer, when the acids of lemon and other ripe fruits are so grateful and useful. Press your hand on the lemon and roll it back and forth briskly on the table to make it squeeze more easily; then press the juice into a bowl or tumbler—never into tin; strain out all the seeds, as they give a bad taste. Remove all pulp from the peel and boil in water—a pint for a dozen pulps—to extract the acid. A few minutes' boiling is enough; then strain the water with the juice of the lemons; put a pound of white sugar to a pint of juice, boil ten minutes, bottle it, and your lemonade is ready. Another way to prepare lemonade is the annexed: Take the rind off four lemons, pared very thin, three-quarters of a pound of loaf sugar, pour on them one quart of boiling water. Take the juice of the lemons in another vessel, and pour on it one pint of boiling milk; let both remain until the next day. Then mix the whole together, adding half a pint of raisin wine; strain all through a jelly-bag until clear. The milk should be removed from the fire and used before the froth rises.—Health.

Passengers east from Chicago to Fort Wayne, Findlay, Fostoria, Cleveland, Erie, Buffalo, New York City, Boston, and all points east, will consult their interests and find advantage in selecting the Nickel Plate road east from Chicago. Three through trains are run daily, with through day-conches to New York City, and modern Pullman sleeping-cars to destination. Rates always the lowest, and no excess fares are charged on any train, for any part of the journey. Modern dining-car service, with individual club meals, ranging in price from 35 cents to One Dollar; also meals a la carte. Ask for tickets via the Nickel Plate Road. Chicago depot, La Salle and Van Buren Streets, the only station in Chicago on the Elevated Loop. Chicago City Ticket Office, 111 Adams Street. Detailed information may be secured by addressing John Y. Calahan, General Agent, No. 113 Adams St., Room 298, Chicago.

50 HEREFORDS 50

WALNUT GROVE FARM ...FOR SALE...

Upon the advice of several specialists I am going to New Mexico for my health. On this account I must dispose of all my Kansas property, including the famous Walnut Grove farm, the most complete and profitable stock farm in Kansas. This includes 130 acres of the best land in Kansas, two miles from Emporia. Over 200 good O. I. C. hogs. All our Barred Plymouth Rocks, 36 Collies, 44 head of cows, 8 head of horses, the best farm house in the State. Also one small farm house, 2 large barns, 2 large cattle-sheds, one 300-foot hen house, one 250-foot broiler house, 20 brooder houses, capacity of plant, 4000. The best hog house in the West, double-deck cement floors; many small hog houses. This is not an experiment, but a successful stock farm. Price, \$20,000 cash.

You Will Prosper

in the great, growing

Southwest

If you purchase a farm in the Southwest now, while the land is cheap, you will soon see grow up around you a community of prosperous, energetic men, who like yourself, have seen the possibilities of the Southwest, and have taken advantage of them. This very condition, which is rapidly forming all over the Southwest, is making the value of land increase rapidly, to the certain profit of those who own it.

There are more and better opportunities for making money—for home building, in the Southwest—along the line of the Missouri, Kansas & Texas Railway to-day, than anywhere else. You have only to get on the ground to prove this. If you are in any way interested in the Southwest, write to-day for a copy of my new paper "The Coming Country."

Go Southwest Now

Take advantage of the homeseekers' rates, April 17th and May 1st and 15th, and go and see the country for your self. On above dates most lines will sell both one-way and round trip tickets at exceptionally low rates. If your nearest railroad agent can not give you the rates, write me for particulars.

Are You Ready for Harvest?

There is a dignity about the International Harvester Company advertising we are running which is befitting the subject. "Mother Nature has done her part. The fields are ripe. Are you ready for the harvest?" That is the dignified way the great Harvester Company introduces to our readers its excellent machines, Champion, Deering, McCormick, Milwaukee, Osborne, and Plano, which aid in the harvesting of so large a part of the grain and hay raised in America.

Readiness for the harvest is all important. As the grain and grass are ripe, so are the machines ready and equal to the duty. Nobody questions the superiority of the International mowers and reapers. They have all been tried in the field, all of them for many years. They represent individually the best skill and material and adoption to duty that the country has produced. Many other machines have been invented, but most of them have disappeared. These have survived—a case of "the survival of the fittest." It remains for the farmer who has plowed and sown and raised his crop to provide himself from the machines at hand the particular ones which he needs to enable him to harvest his crop quickly and surely and economically.

No word of ours could add to the reputation of the International Harvester machines. No word is needed. It is enough to say that no mistake can possibly be made by purchasing any one of the six machines named. But the warning to get ready for the harvest is timely. International agencies are established at every considerable trading point to facilitate distribution and furnish supplies and repairs. These agencies have catalogues and descriptive matter on the long line of harvesting machines the company builds in addition to the mowers and binders. Farmers should call, procure the catalogues, make a study of them and determine in due time on the machines they will buy. Profitable farming demands improved machinery. Buy things that are standard and do it in time to have all things ready for the harvest.

There Is a Big Difference.

Laundry soap is intended for coarse work, such as washing clothes. Toilet soap is suited to taking the dirt from the skin. Shaving Soap is different—or ought to be. It should thoroughly moisten the hairs, hold them firmly against the razor, and then leave the skin smooth, cool, and velvety. Williams' Shaving Soap will do just this. The J. B. Williams Co., Gladstone, Conn., have made a specialty of shaving soap for nearly three-quarters of a century, and it is the "only soap fit for the face." In another column they offer to send a free trial sample on receipt of a 2-cent stamp. Be fair to your face and send for it.

Every household in Kansas should have Smith's 24th annual catalogue which is a veritable manual on the culture of small fruit-trees and shrubs. It will be sent free to any reader of the KANSAS FARMER by addressing a card to E. F. Smith, Lawrence, Kans., Drawer C.

The many years which the Reliable Incubator and Brooder Co. have been before the public have established their reputation for producing a most excellent line of poultry appliances. The machines they offer the present season are fully up to their previous standard of excellence, besides embodying further improvements. A complete description of their incubators and brooders will be found in their catalogue, which they will be pleased to mail free of cost to any one who will address The Reliable Incubator and Brooder Co., Quincy, Ill., requesting a copy of same. When writing, kindly mention this paper.

Grain in Kansas City.

Receipts of wheat in Kansas City yesterday were 74 cars; Saturday's inspections were 32 cars. Offerings were liberal. Owing to stronger future markets, there was some improvement in the demand. Prices were unchanged. The sales were: No. 2 hard, 2 cars 81c, 2 cars 80c, 2 cars 77c, 2 cars 76½c, 10 cars 76c; No. 3 hard, 1 car 76c, 2 cars 74½c, 8 cars 74c, 10 cars 73½c, 7 cars 73c; No. 4 hard, 1 car 70c, 7 cars 69c, 1 car 68½c, 1 car 68c, 1 car 67c; rejected, 1 car 61c, 1 car 60c, 1 car choice 66½c; No. 2 mixed, 1 car 83c; No. 3 mixed, 1 car 78c, 1 car 70c; No. 4 mixed, 1 car 63c; No. 2 macaroni, 1 car 68c; No. 2 red, 1 car 94c, 2 cars to arrive 94c; No. 3 red, 1 car 91c; No. 2 white spring, 1 car 82c.

Receipts of corn were 69 cars; Saturday's inspections were 33 cars. The demand was good and prices were unchanged to ½c higher, as follows: No. 2 mixed, 4 cars 41c, 3 cars 40½c, 8 cars 40½c; No. 3 mixed, 1 car 41c, 10 cars 40½c, 13 cars 40½c; No. 4 mixed, 2 cars 39c; No. 2 yellow, 2 cars 41½c, 2 cars 41c; No. 3 yellow, 1 car 41c; No. 2 white, 1 car 42½c, 1 car 42½c; No. 3 white, nominally 42½c.

Receipts of oats were 26 cars; Saturday's inspections were 11 cars. Offerings were fairly large. The demand was good and prices averaged unchanged, as follows: No. 2 white, 1 car 31½c, 1 car 31½c, 4 cars 30½c, 5 cars 30½c; No. 2 mixed, nominally 30½c; No. 3 mixed, 2 cars 30c, nominally 29½c.

Barley was quoted 37@39c; rye, 56@58c; Kafir-corn, 68@70c per cwt.; bran, 88c per cwt.; shorts, 90@95c per cwt.; corn chop, 80@82c per cwt.

Kansas City Live Stock Market.

Stock Yards, Kansas City, Mo., Monday, April 2, 1906.

The cattle run held up last week, 40,000 head coming in, about the same as the previous week, and 10,000 more than same week last year. Not quite as large a proportion were beef steers as the week before, but all through March the percentage of beef steers was larger than ever before for the same month, and probably larger than any month in the records of the yards. The very

Special Want Column

"Wanted," "For Sale," "For Exchange," and small want or special advertisements for short time will be inserted in this column without display for 10 cents per line of seven words or less per week. Initials or a number counted as one word. No order accepted for less than \$1.00.

CATTLE.

FOR SALE—Some good young Shorthorn bulls just a year old by the 2300 pound Marshall Abbotts-burn 3rd 185305. Cheap, breeding and individual merit considered. D. Ballantyne & Son, Herrington, Kans.

HOLSTEIN—Bull calves 6 and 10 months old—good ones. H. B. Cowles, Topeka, Kans.

REGISTERED Aberdeen-Angus cattle for sale. Fifteen bulls from 10 to 20 months old; 15 heifers from 1 to 2 years old; 15 heifers from 2 to 3 years old; 25 cows some with calves at side. I am making farmers prices on all or a part of the above cattle as I do not have room for them this summer. Heather Eclipse 38761 in service. A. L. Wynkoop Bendena, Kans.

FOR RED Polled bulls or heifers write to Otto Young, Utica, Kans.

FOR SALE—Holstein-Friesian bull calves. Address Hughes & Jones, Route 2, Topeka, Kans.

RED SHORTHORN BULL for sale. A. C. Rait, R. R. 4, Junction City, Kans.

FOR SALE—One registered double-standard Polled Durham bull, 2 years old in March, 1906, color dark red. Will consider trade for females of the same class of stock. Address Jacob J. Yoder, Haven, Kans. R. R. 2.

GALLOWAY BULLS—4 head, 16 to 18 months old, suitable for service. All registered. Address C. A. Kline, R. F. D. 2, Tecumseh, Kans.

large number of cattle on feed in this territory, together with the ability of the packers to handle larger numbers here than ever before accounts for this. The market was strong last week, all killing cattle, except medium to common heifers and veal calves making a gain of 10@15c. Conditions in the country are still unfavorable to the purchase of stock cattle or feeding cattle, and this class declined 10@15c last week.

The cattle run is unexpectedly large to-day, 12,000 head here, but the supply last half of last week was small, and packers and outside buyers were ready to make liberal purchases this morning. Market on killing stuff is steady, stockers and feeders strong. Top last week on beef steers was \$5.85, top today \$5.90, highest for about six weeks, a good many cattle at \$5.50@5.80, and bulk of steers \$4.70@5.35, very few steers below \$4.50. Heifers and yearlings sell at \$4.25@5.25, fair to good cows \$3.75@4.50, bulls \$3@4.25, veals 50c lower than a week ago, at \$5@6.50, stockers and feeders \$3@4.80, most sales in this class \$3.50@4.50. Total cattle receipts for March increased 20 per cent over March a year ago, and 12 per cent over March two years ago, which was the largest previous March in cattle receipts at this market.

Hogs sold higher all last week till Friday, but closed the week 5c lower than high time. A feature was the increasing value placed on light weights, hogs below 200 pounds selling only 5c below the top now. Market opened strong to-day, but broke 5c before the close, top \$6.40, bulk of sales \$6.25@6.27½. Run to-day 9,000 head. Dealers expect liberal supplies and lower prices this week.

The mutton market improved steadily after Monday last week, closing 5@15c above close of previous week. Run is liberal to-day, at 11,000 head, market strong, lambs selling at \$6@6.50, clipped lambs late last week at \$5.40, and spring lambs Friday at \$9. Wethers and yearlings have been scarce, but are quotable at \$5.50@6, ewes bring \$4.75@5.40, feeding lambs last week at \$5.25@6. J. A. RICKART.

South St. Joseph Live Stock Market. South St. Joseph, Mo., April 2, 1906.

The opening of the trade at this point and at all central points as well, indicates some improvement in conditions of country roads, and a consequent enlargement in the movement of live stock. Receipts of cattle to-day at this point were about 2,000, and did not show so much increase over last Monday, but at five leading points there was

CATTLE.

F FARMS AND RANCHES.

320 ACRES, 6 miles from Emporia; 6 room house, barn 30 by 36, cattle-shed 20 by 40; good orchard and other fruit, 70 acres cultivated; 300 acres can be plowed or mowed; watered by wells and creeks; one mile to school. Price \$28 per acre. Can give immediate possession. Hurley & Jennings, Emporia, Kans.

800 ACRES FENCED—Half wheat land, house, barn, well, windmill, orchard, 250 acres wheat and barley, 5 miles to railroad. Terms. E. H. Boyer, Meade, Kans.

PLANTS—Bulbs, shrubs, evergreens, roses, etc. Strawberry plants per 100, 35c; 1,000, \$2.25. Raspberry, 100, 70c; 1,000, \$6. Blackberries, 100, 70c; 1,000, \$5. Grape, 2 year, 5c. Currents and gooseberries, per 10, 50c. Asparagus, 100, 40c; 1,000, \$2.25. Rhubarb, 10, 30c; 100, \$2.25. Gladiolus bulbs per 10, 10c; 100, 75c. Dahlias, per dozen 75c. Hardy herbaceous plants, greenhouse plants, etc. Price list on application. Bonner Spriggin Nurseries, Bonner Springs, Kans.

ONE DOLLAR will buy enough of McCauley's white seed corn to plant seven acres if you send to A. J. Nicholson, Manhattan, Kans.

FOR SALE—Spring of 1906 seed sweet potatoes six kinds. Price on application; also a fine lot of eating sweet potatoes. I. P. Myers, Hayesville, Kans.

FOR ONE DOLLAR I will send you 300 strawberry plants, 5 kinds, or 100 raspberry, 3 kinds, or 100 blackberry, or 25 grapes, 3 kinds, or 25 currants or 25 gooseberries or 20 asparagus: none better at any price. A. J. Nicholson, Manhattan, Kans.

an apparent increase of 11,000. Light steers on the local market sold about steady, the stocker and feeder demand helping this end of the trade, but for fat steers of all weights, trade had a slow, unsatisfactory pulse with prices ruling weak to a dime lower. The stock of all kinds was in very light supply, and held fully steady. The calf market broke about 25c with choice veals going at \$6.25. The stocker and feeder demand was fairly good, and local dealers picked up everything offered at steady prices. The coal strike is now a factor that will be watched very closely by packing interests, and a shut-down at the mines would be very apt to affect the live stock markets adversely. For this reason it would be just as well for owners to be a little conservative for a few days, although the situation to-day is not considered serious.

Local receipts of hogs were almost double the number arriving a week ago and all other points showed quite an enlargement. The demand was pretty fair but packers' movements clearly showed that they are watching for increased receipts with coming improvement of the roads and will make a strong fight to prevent prices from going any higher. The market opened strong to 5c higher but settled back to about steady. The quality of hogs was exceptionally good and for this reason the prices on paper looked a little higher than at the close last week. Tops to-day sold at \$6.42½, with the bulk at \$6.32½@6.40.

Receipts of sheep at this point were quite liberal, made up largely of Colorado lambs. The demand was quite good and prices were held fully steady for lambs and steady to strong for sheep. Top lambs sold at \$6.45 with bulk at \$6.30@6.40 and best ewes at \$5.40. J. A. RICKART.

WARRICK.

100,000 ACRES OF IRRIGATED LAND**in Sunny Southern Alberta, Canada****THE LAND OF WINTER WHEAT, ALFALFA AND SUGAR BEETS**

These lands are part of the great irrigation project constructed by the Canadian Pacific Ry. in the CALGARY DISTRICT OF SOUTHERN ALBERTA. We now have ready for the farmer one hundred thousand acres of those lands, lying on the northern side of the main line of the CANADIAN PACIFIC RAILWAY at Gleichen, extending back ten miles in a solid block,

at from \$18.00 to \$25.00 an Acre

The canals and laterals are to be maintained forever by the Canadian Pacific Ry. at a nominal cost of 50 cents per acre per annum.

NO FLOODS, NO DROUGHTS, EVERY YEAR A HARVEST YEAR

this too on land that will produce 30 to 60 bushels of hard winter wheat, 80 to 100 bushels of oats to the acre, with enormous yields of alfalfa, sugar beets and all small grains. Remember, the lands are all adjacent to the main line of the Canadian Pacific Ry., giving easy access to the world's best markets. For further particulars and certificate for low railroad rates, write

Canadian Pacific Irrigation Col'n Co. Ltd.

Barn Plans and Outbuildings

New, revised and greatly enlarged edition,
 Modernized and brought up-to-date

EDITED BY EDWIN C. POWELL

A reliable guide to those intending to build new barns or to remodel old farm buildings for any and all purposes.

The proper and economical erection of barns and outbuildings requires far more forethought and planning than was ordinarily given to their construction. But with modern ideas, proper appreciation of sanitary conditions, and the use of labor-saving implements, a barn that twenty-five years ago was considered perfect would not meet present requirements.

Outline of Contents:

After an introductory chapter on the general rules to be observed in barn building, special chapters give detailed information and illustrations on

GENERAL FARM BARNs
 CATTLE BARNs AND STABLES
 DAIRY BARNs
 CATTLE SHEDS
 SHEEP BARNs AND SHEDS
 PIGEONERS
 POULTRY HOUSES
 CARRIAGE HOUSES AND HORSE BARNs
 CORN HOUSES AND CRIBS
 ICE HOUSES

ICE HOUSES AND COOL CHAMBERS
 DAIRY HOUSES
 CHEESERIES AND CHEESE FACTORIES
 SPINNING HOUSES
 GRANARIES
 STOKE HOUSES
 DOG KENNELS
 MILKS
 ROOT CELLARS AND ROOT HOUSES
 BUILDINGS OF VARIOUS KINDS, ETC., ETC.

All descriptions and directions contained in this volume are given in so plain and clear a manner as to be readily understood by anyone. Every professional builder, and every person, be he farmer or otherwise, who intends to erect a farm building of any kind, can, in this book, secure a wealth of designs and plans for a very small sum.

With 375 illustrations, 5 x 7 inches, 404 pages.

Cloth, price, postpaid, \$1.00

FRANK IAMS

and his "Big 4" three year old Percheron stallions, weight 8340 pounds. Winners of 1st, 2d, 3d and 4th prizes at Iowa and Nebraska 1905 State fair (over all). They are "sensational show stallions"—"Iams' sort." Iams sells models like these "Peaches and Cream" stallions at \$1000 and \$1500. It's up to you, Farmer John! Will you be "humbugged" by "bunco salesmen?" Iams owns and sells more 1st-class stallions than any man in the United States. He has his "selling clothes" on, no man with cash or bankable note gets away from Iams. Iams' daily "Horse show" and his "town of horse barns" filled to the roof with wide-as-a-wagon "black boys."

80—STALLIONS—80

2 to 6 years old, weight 1700 to 2600 pounds, 90 per cent blacks, 50 per cent tan stallions." All registered, approved and stamped by European Government Dad. It's "100 to 1" that Iams is pushing his competitors off the roof and hypnotizing his buyers with "top notchers" at 50 cents on the dollar, "let live prices." Iams' "horse show" at Iowa and Nebraska State Fair was the "talk of the town." The "best ever." All winners and sons of winners. His 2, 3 and 4 year old Percherons, Belgians and coach stallions won every 1st, 2d, sweepstakes and grand sweepstakes prize at Nebraska State Fair. At Iowa State Fair they were winners of 90 per cent of same prizes in above classes, and the Iowa and Nebraska people said Iams is a "hot advertiser," but "he has the goods" better than he advertises. Teddy, it's "16 to 1" that Iams' "Peaches and Cream" stallions are "hot stuff" (for competitors). "It's a clinch" that Iams saves his customers thousands of dollars in commissions and middlemen's profits. Iams places \$1000 insurance for \$60.

\$1000—SAVED AT IAMS—\$1000

Ikey! What a rich graft these "slick stallion salesmen" are working on the honest farmer selling 4th rate stallion at \$2000 to \$5000. Iams sells "top notchers," so good, big and cheap that they do not need to be peddled to be sold. Mr. Buyer, see Iams' stallions yourself. Take no "gold brick stallion salesman's" word. Iams has "the goods" you read about. His establishment is worth going 2000 miles to see. Iams makes his competitors "holler." He is knocking "high prices" out of the X'mas tree. Iams saws wood, "butts in," sells more stallions each year. He makes every statement good. Georgie, dear! Buy a stallion of Iams. His \$1200 stallions are much better than our neighbors paid those Ohio men \$4000 for. Then I can wear the diamonds. Iams speaks the languages, buys direct from breeders, pays no buyers, salesmen or interpreters, has no two to ten men to divide profits with. Iams guarantees to sell a better stallion at \$1000 to \$1500 than are sold to Stock Companies for \$2500 to \$5000 by slick salesmen, or pay you \$100 for your trouble, you the judge. Iams pays horses' freight and buyer's fare; gives 60 per cent breeding guarantee. Write for eye-opener and greatest horse catalogue on earth. References: St. Paul State Bank, Citizen's National Bank, St. Paul, Nebraska.

The Lincoln Importing Horse Com'y

Lincoln, Nebraska

Now we are here with our catalog. It is ready for distribution. Parties contemplating buying stallions write for catalog. Remember, every stallion represented in the catalog is of our own importation and all of them this year's importation, except the group of three. We also have a large number of stallions not exhibited in our catalog. Note what we say in regard to this group. The three weigh 5,890 pounds; the largest stallions in the West in the same flesh. Some of our 2-year-olds of our last importation will tip the scales at 1,850 to 1,900 in only moderate flesh. Come and examine them at our expense if you find that we have misrepresented to you. Remember, our scales are in front of our office. You do your own weighing.

The Greatest and Best Advertising Medium for
Reaching the Farmers of the Middle West, of
TOPEKA,

KANSAS

CALIFORNIA

Suburban Villa Farm, Residence Lot or Round Trip Railroad Ticket

So Easy!!

To be earned by the Intelligent Man or Woman, over 18 years of age, complying with the following conditions. READ THEM.

EXPLANATORY INTRODUCTION.—To enable the Fresno Irrigated Farms Co. to determine if the advertising now running in Eastern farm papers is being intelligently understood, we will award property valued at \$1325 as compensation to the readers of this paper for articles written for our use. Articles must only be furnished by those residing in Kansas, Illinois, Indiana, Iowa, Missouri, Michigan, Minnesota, Nebraska, North Dakota, South Dakota, and Wisconsin, for the best written article in not less than 800 words or more than 1,000 words. The article must be written on only one side of the sheet of paper, either in your own handwriting or on a typewriter.

CONDITIONS.—Write your article on the following subjects.

No. 1, General subject will be Fresno Irrigated Farms. Our choice farm lands are only \$35 to \$75 per acre sold upon liberal terms.

No. 2, Climate.—Give reasons why you would prefer to live where snow is unknown.

No. 3, Soil.—Explain the nature of the soil and its adaptability.

No. 4, Irrigation.—State why under farming dependent upon rainfall the best lands of Illinois or Iowa have increased in value at the rate of only \$2 per acre per year since their first settlement, whereas Fresno Irrigated lands advance in value at the rate of \$20 to \$25 per acre per year. Give the advantages of Irrigation over dependency upon rainfall.

No. 5, Town of Kerman.—Situation, on what railroad, in what county, and about how many miles from your home to Kerman. Estimate the probable population of Kerman three years from now.

No. 6.—State why you would like to live on a Fresno Irrigated Farm and what advantage the new town of Kerman offers over your present home.

No. 7, Productions.—Under this heading you can select as many of the products mentioned below as you are most familiar with. You do not have to write upon all of them. We are simply offering you these particular products as suggestions to aid you in getting your article up right. It would be well in this section to estimate what your understanding is of the productiveness of the soil per acre when devoted to these products. SUGGESTIONS: A raisin vineyard, a peach orchard, a fig orchard, a table grape vineyard, a wine grape vineyard, a chicken farm, a dairy farm, cattle and live stock ranch, an alfalfa farm; estimate the number of crops of hay cut per year and about how many dollars per acre per year it will produce.

Permissible Source of Information.—You may ask for the 64 page Illustrated Book published by the Fresno Irrigated Farms Co. of Fresno, California. You may obtain pamphlets issued by the Fresno Chamber of Commerce

or the following newspapers: The Kerman News of Kerman, the Fresno Democrat or the Fresno Republican of Fresno, or the Southern Pacific Company's Booklets on the San Joaquin Valley. All these will be mailed you free when you write for them. Any or all of these can be used by you in writing your article as sources of information, but they are not to be copied. You must use your own language. You can apply to any other source of information that you know of for facts but remember your article must be original, and not copied from any book or pamphlet.

Those Barred from Competition.—Any one that has been in Fresno County, California, is barred from this competition for the reason that we intend every reader of this paper to have exactly the same chance, especially those that have not been to California. You must not write to us for further information about this competition other than that which we print. Every one is entitled to our printed booklets and circulars.

The Article.—Your opportunity is just as good to earn these valuable pieces of land as any one else, plain words and common sense is all that you need use. A fine literary style is not at all necessary. All articles must be received on or before June first, 1906.

Awards.—Awards will be made July 1st, 1906, land will be deeded in payment for articles July 10th, 1906, and ticket will be forwarded any time wanted within three months after July 10th, 1906.

Committee on Awards.—Senator Drew of Fresno, State of California, and Trustee of the University of California, Chairman A. L. Hopps, President of the Fresno County Chamber of Commerce, O. J. Woodward, President of the First National Bank of Fresno. Awards will be made absolutely on the merit of the article and for no other reason.

Awards.—First, For best article, a five acre villa farm adjoining the town of Kerman already plowed, plotted and seeded in alfalfa, and already under irrigation, valued at \$1000. Second, For next best article, a residence lot in the town of Kerman, size 50x140, streets already graded, town containing new \$10,000 Hotel within easy distance of the railroad station or the park. All modern conveniences, such as telephone, telegraph, express, water works, value \$250. Third, For third best article, a roundtrip railroad ticket from Chicago or any point west of Chicago to Kerman, California, and return to starting point, value \$75.

A Hint.—Read our ads in back numbers of this paper. They will give you still more information. The advertisement of this offer will not appear again, SO ACT NOW.

KAF

Volume XLIV. Number 15

TOPEKA, KANSAS, APRIL 12, 1906

Established 1863. \$1 a Year

Santa Fe Good Roads Special

Realizing the difficulties that confront the farmer when he attempts to move his tremendous crops from the fertile fields of Kansas to the railroads for shipment to the markets and the consequent difficulty the railroads have in meeting his demands, the Santa Fe Railroad System inaugurated a good-roads train which held its first meeting and demonstration at Olathe, Kansas, on March 26. Under present conditions, when bad weather comes, it is impossible for farmers to move their crops to market and the railroads have cars lying idle that they would gladly have in use. The price of farm products increases and the farmer is compelled to sit idly by with a large yield of valuable products in his bins and feed-lots and feel his inability to realize on them. On the other hand, when the roads become good the farmers all load up their wagons and go to the shipping point at once. The market is glutted, prices go down, and the railroad is unable to furnish a sufficient number of cars. Chief among the things which will bring about a change in these conditions is the making of good country roads. With good roads the farmer can reach his market at any season of the year and realize on his crops when the prices are at their best. The railroads can furnish cars at all times and avoid that congestion of traffic which causes such great inconvenience and loss at certain seasons. For these reasons and others, the Santa Fe railroad officials have adopted the broad, progressive policy of assisting their patrons in every way possible because their interests are mutual. The prosperity of the patron means the prosperity of the railroad. Kansas has the distinction of having had railroads before it had either freight or passengers. The Santa Fe railroad was the pioneer of the West. It was conceived in Kansas brains and its first rails were laid by Kansas money. No influence has been so great in the development of the South and West as has the Santa Fe railroad. It is a Kansas institution although it reaches far beyond Kansas State lines. It has more miles of road in Kansas than in all the twelve other States and Territories through which it passes. The keen, far-sighted business men at the head of the Santa Fe System realize that conditions in Kansas are widely different now from what they were when their rails were first laid; when there were no fences and the country road might be miles wide if desired. They realize that it is impracticable and undesirable to tax the farmers to build macadam roads, and they further realize that a real solution of the good-roads question has been found in the use of the split-log drag so strongly championed by Mr. D. Ward King, of Maitland, Mo.

In order that farmers may get their information at first hand, a special car was equipped with a simple split-log drag, made at small cost and in a short time, as its only illustrative apparatus. There was no other machinery and there was nothing to sell. It was a free gift to the people of Kansas.

THE MEETINGS.
The man who made the split-log drag famous.

partment of the Kansas State University, and Thos. H. MacDonald, Ames, Ia., engineer of the Iowa Highway Commission. Other members of the party were W. T. Treleaven, Chanute, Division Freight Agent, Santa Fe railroad; R. E. Wilson, Chicago, Traveling Industrial Agent, Santa Fe Railway; H. E. Hurshey, Galveston, Tex.; Traveling Freight Agent, Gulf, Colorado & Santa Fe Railway; L. M. Nellis, Topeka, of THE KANSAS FARMER; J. C. Burnett, Topeka, Division Freight Agent, Santa Fe Railway, and W. H. Robbins, Minneapolis, St. Paul, and Sault Ste Marie Railroad.

THE MEETINGS.

This party was met by a large and enthusiastic crowd at every stop on the route with the exception of one place where bad weather interfered. The meeting at Olathe was characterized by the large attendance of county and road officials some of whom drove twelve miles over almost impassable mud roads in order to be present.

At Wellsville, seventy-five men signified their intention of building and using split-log drags, and since the meeting was held there on March 27, the rural route carriers report that more than forty miles of road on their routes have been dragged and greatly improved.

At Ottawa, the business men of the city held a meeting in the First National Bank before the good-roads meeting was called to order and raised \$500 to be distributed in prizes among the farmers who would maintain the best roads by use of the split-log drag. These prizes will be announced in the premium list of the Franklin County Fair Association and the prizes will be awarded during the fair as one of its features. Other stops were made at Iola, Chanute, Erie, Coffeyville, Inde-

pence, Lawrence, Emporia, and Topeka.

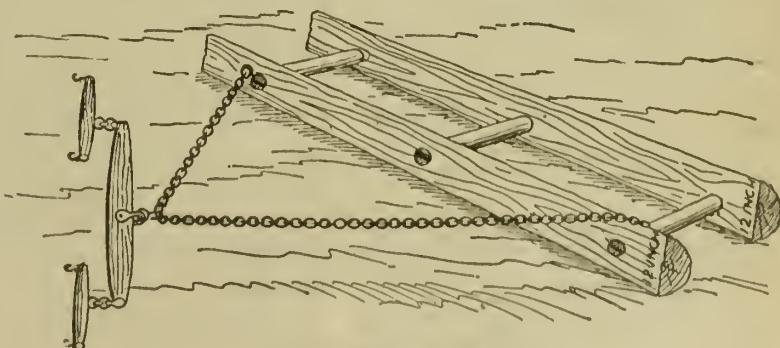

Public interest in the good roads movement has reached a height never before attained in Kansas, and it has now been demonstrated that good roads are possible without money. Instead of asking the Legislature for the appropriation of a large fund with which to aid the counties in their operations of building expensive roads, it is now proposed to ask that the Legislature appoint the State Agricultural College and the Engineering Department of the State University as a highway commission, whose duty it shall be to superintend the construction of roads, to give expert advice on methods and materials, and to conduct experiments along the lines necessary to the development of the public highways. This will require no increase in taxation, the creation of no new offices, and will allow each county to tax itself for good roads or not as the voters may decide.

It is impossible to foretell the vast amount of good that will be accomplished by this businesslike act on the part of the Santa Fe Railroad. One of the results that are immediate is shown by the renewed esteem in which the road is held by Kansas people.

Mr. King's ideas are embodied in the following description of how to make and use the split-log drag.

HOW TO MAKE THE DRAG.

In order to make the split-log drag in accordance with ideas gained by long experience, the following points should be noted. Select a log of some light wood, such as boxelder, elm, or the butt end of a telephone pole, but be sure to have it light and 12 inches thick. Cut it seven feet long if you have an ordinary team of horses, or nine feet long for an extra heavy team.

The Split-Log Drag.

Select a log with straight grain if convenient, or one with a right-hand twist to the grain. The latter is preferred by many of experience. Split the log in equal halves, and bore three two-inch holes through each half in such a manner that the rear half, when set on edge, will stand sixteen inches to the left of the front half. Secure some pieces of timber of proper dimensions, bethem down so they will fit the auger holes, drive them in securely, and wedge the ends. Both halves of the log must be set on edge with the flat sides in front, after they are fastened together 30 inches apart with the cross-pieces. The cut shown herewith is made from an earlier type of the split-log drag and does not show the logs arranged as just described. It

close together that they do not clear themselves of mud.

DRAG MADE OF SAWED STUFF.

If a suitable log is not readily available, the drag may be made of sawed planks which must be not less than 2 x 10 inches. A two-inch plank ten inches wide and twelve feet long may be sawed diagonally at the middle or cut "on the bias," as the ladies say, so as to obtain the required seven feet in length and reduce expense for lumber. When such timber is used it is found best to reinforce it by nailing a 1 x 6 on the rear side of each plank as it will stand when the drag is complete. The planks may then be fastened together in the same manner as (Continued on page 410.)

Editorial

THE HUSBAND'S INHERITANCE.

EDITOR KANSAS FARMER:—Please tell me if I have not misunderstood a statement in your paper of March 29 entitled "The Husband's Inheritance." You say "upon the death of the widow his estate descended to his own children." You do not mean to all his children do you? I had always understood that in such a case when the widow died, her property went only to her children.

SUBSCRIBER.

The case (52 Kansas Reports, page 392) mentioned in our answer under the title "The Husband's Inheritance" was one in which the man had offspring by each of his three wives and died three weeks prior to the death of his third wife. The opinion was written by Chief Justice Horton. The following is the syllabus of the opinion as published in the Fifty-second Kansas:

"Deceased in his lifetime was married three times. By his first wife he had one child, by his second wife he had one child, by his third wife, surviving him, he had five children. He died intestate in this State. At his death, one-half in value of his real estate, not necessary for the payment of his debts, descended in fee simple to his widow; the other half of his real estate descended to his seven children equally, being all of his children by his three wives. Held, also, that upon the death of the widow her estate descended to her own children."

A slight error occurred in printing an abridged statement of this syllabus in THE KANSAS FARMER of March 29. This full quotation makes the case plain and is explicit, bearing in mind that the husband inherits from the wife exactly as the wife inherits from the husband.

WARBLES IN COWLEY COUNTY.

EDITOR KANSAS FARMER:—I have read with much interest the views of Mr. Jackson and the theory produced by Chief Mayo concerning the warbles. I have watched the warble in cattle's backs all my life and thought everybody knew what made them, but perhaps I do not know. I think Mr. Jackson's view is nearer right than the theory produced by Mr. Mayo. In this locality we have what we call the big cow-flies. They are fully an inch long or even longer and of a dark gray color. Then we have another species that is black and just a trifle larger, but of identical habits. The black flies are not nearly as numerous as the gray flies. These flies make their appearance about the middle of July, become more numerous in August, and begin to disappear the latter part of September. They scarcely ever bother cattle in the middle of the day. They are worse from five o'clock in the evening until dark than at any other time, and are much worse where there is timber than anywhere else. Cattle hate them and run when these flies alight on them. When one of these flies becomes once located on a cow, it tries to bury itself in the hair as much as possible. It then bores its bill into the skin until it fills itself with blood. Just before leaving the animal it drops a tiny, clear drop from its tail, then leaves with difficulty with a buzz of its wings. I think this clear drop is the egg for the coming warble, and I believe the warmth of the animal causes it to hatch very soon, and it enters the place which the old fly made in the skin. It remains there under the skin until matured which is the next spring. It then cuts through the hide, crawls out, falls to the ground a thick, stubby grub with little sharp horns in rows around its body. I have sat and watched it wiggle and twist, but if in a soft spot of ground it soon buries itself in the ground to finish its career as a warble or grub. It returns in July or August a full-fledged, winged insect fully determined to try to keep up its family. I am satisfied with this theory as it is the result of very close observation. The warble looks like a bot that is found in a horse's stomach, but the warble is much larger when ready to go into the ground. According to Mr. Mayo's theory, the warble could be found all through the tissues of the body.

SUBSCRIBER.

One of the best authorities on entomology is Professor Vernon S. Kellogg of Leland Stanford University, California. He is the author of a book of 674 pages in which insects are described and their life histories traced according to the latest information developed at the time of the publication of this book

In 1905. On page 338 Professor Kellogg says:

"The bot-flies, warble-flies, or heel-flies of cattle, whose larvæ are found in small tumors under the skin, also [Professor Kellogg has just described the bot-flies of horses] have their eggs swallowed, and the young larvæ may be found in the mouth and esophagus. But from here they burrow out into the body-tissues of the host, finally coming to rest underneath the skin along the back. When the larva or grub is full-grown, it gnaws through the skin, drops to the ground, pupates, and, in from three to six weeks, changes to the adult fly."

Speaking of these flies, including bot-flies of horses and of other animals, Professor Kellogg says: "The flies are heavy-bodied, often densely hairy, banded insects, looking rather like small bumble-bees whose mouth-parts are so atrophied that they can probably take no food at all. They lay their eggs on the hairs or skin of their special host animal, and the larva on hatching bore directly through the skin and into the tissues of the host, or, as in the case of the familiar bot-fly of the horse and the heel-fly or warble of cattle, the eggs are taken into the mouth of the host by licking, swallowed, and thus introduced directly into the stomach, to whose walls the larvæ either attach themselves or through which they burrow into the true body-cavity of the host."

These descriptions by the best authorities in the world are the results of the most careful observations. They are not derived from theories but from investigations. The editor suggests that stock-owners interested trace the transformations with more care and continuity.

In combating any kind of pest, it is important to know accurately its life history. Taking the controversy about warbles as an example, the cattle-owner who fights the large flies described by our correspondent, for the purpose of reducing the number of warbles is probably wasting his effort. If, however, he can prevent the heel-flies from depositing their eggs, or destroy the vitality of the eggs before the cattle lick them off, he will be working directly against the pest.

FREIGHT CHARGES—WELL DRILL.

EDITOR KANSAS FARMER:—I am a reader of THE KANSAS FARMER and would like to ask a few questions.

I moved from Girard, Crawford County, Kansas, to Plains, Meade County, Kansas. I chartered a car from the Frisco people. I left Girard on February 14, and reached Plains on February 17. My freight weighed 24,500 pounds. I was charged \$98 for the trip. It seems to me that it was a very large price. Can you give me information in regard to the matter? I understand that the freight rates on the Frisco were cut about the middle of last month.

Can you give me any information about how and where to get a well-drill? I want to drill a well. How much will it cost to get a cheap drill? I will have to drill about one hundred and twenty feet. R. J. BURDICK.

Meade County.

The writer called upon the division freight agent of the Rock Island railroad with reference to the freight charges mentioned by this correspondent. This official went into a very full examination of the rates assuring the writer that if any error had been made it would be corrected. He found, however, that no overcharge had been made. No special reduction on this class of freight has been offered.

It will be wiser for our correspondent to employ some one who has a well-drill than to buy a drill and accompanying outfit with which to drill the wells that will be needed on one farm. If, however, he is determined to have a well-drilling outfit he should write to Williams Bros., Ithaca, N. Y., whose advertisement is running in THE KANSAS FARMER.

THE STOCK EXCHANGE DECISION.

A decision of the Kansas Supreme Court affecting trusts was handed down last Saturday. The case is one affecting the Kansas City Stock Exchange which originally is held to be a trust under the laws of Kansas, and as such is rendered incapable of doing business in this State.

The decision of the court was rendered in the case of the State against Charles L. Wilson. Wilson was arrested for selling mortgaged cattle. He was tried, convicted, and sentenced to five years in the penitentiary. He appealed the case to the Supreme Court, and made a showing that he had attempted to prove in the lower court that the exchange was a trust. The lower court refused to admit the evidence, and the

Supreme Court reverses the decision and orders that the case be retried. In effect, the Supreme Court declares that the showing that the exchange is a trust is a good defense for the defendant. Justice Mason wrote the opinion, and on the subject of the character of the exchange he wrote:

"An association of persons and corporations engaged in the business of buying and selling live stock and practically controlling that business at the place of operation, which has a by-law forbidding its members to buy or sell live stock for others without charging a commission therefor of at least 50 cents a head is a combination to carry out restrictions in full and free pursuit of a lawful business, and in virtue of that fact is a trust within the terms of chapter 265 of the laws of 1897."

"The charging of a commission for services in the purchase of live stock for another, by a member of such a trust in pursuance of the by-law referred to, is an act made a misdemeanor by that statute, and a contract to pay a commission exacted under such circumstances is void because made in violation of law."

"A note and mortgage given for a consideration, a part of which is unlawful because based upon a transaction made criminal by the statute, are wholly void."

"In a prosecution under an information charging the obtaining of money by false pretenses through selling, as clear, cattle that were in fact mortgaged, it is competent for the defendant to show in defense that the mortgage relied upon by the State, although fair on its face, was void by reason of being based in part upon a consideration made illegal by the anti-trust statute."

THE Y. M. C. A. AT THE STATE AGRICULTURAL COLLEGE.

THE KANSAS FARMER of last week gave an illustrated description of the proposed Y. M. C. A. building at the Agricultural College. This was accompanied by an account of the efforts by which a large portion of the money needed for the erection of the building has been raised, and continued with an appeal to farmers and others to contribute the amount still needed to complete and furnish the building. Of this latter amount it is now announced that \$300 has been subscribed. THE KANSAS FARMER is willing to receive and acknowledge subscriptions and will print the names of subscribers to this worthy enterprise. The money need not accompany the subscription, but it is well to designate a date or dates on which it will be paid.

Professor A. M. TenEyck, whose writings have made him well known to every reader of THE KANSAS FARMER, is chairman of the board of control.

A. M. TenEyck,
Professor of Agriculture, Kansas State Agricultural College, Manhattan, Kansas.

His level-headed influence is ample assurance of judicious use of all funds. Following is a letter which Professor TenEyck addresses to his thousands of friends among the farmers of the West.

My Farmer Friend: Perhaps you are not acquainted with the efforts which we have been making at the Kansas Agricultural College for the past two years with reference to raising a certain sum for the construction of a Y. M. C. A. building for the Agricultural College students. You know something of the work of the Young Men's Christian Association in the cities and colleges of the land. It is a splendid organization and is accomplishing a grand work in developing Christian citizenship and in raising the standard of manhood in our colleges and cities. It is a necessary organization in every university and college.

We have a strong Y. M. C. A. organization at the Agricultural College, but the students have been hampered by not having proper accommodations in the way of buildings and equipment for carrying on the work of the organization. The movement for raising a certain sum for the construction of a suit-

able building to be the home and headquarters of the Y. M. C. A. of this college was begun about two years ago. It seems that we have raised as much by local subscription as it is possible to raise, and we will require at least \$10,000 more to be subscribed before we may begin the construction of the building. We believe that the amount still required ought to be contributed by the people of the State, and a large part by the farmers of Kansas.

It is proposed that the KANSAS FARMER, the Mail and Breeze, and the Farmers' Advocate raise \$10,000 by opening subscription lists. The purpose of this letter is to call your attention to these lists now running in these papers.

The Agricultural College is supported entirely by the State and the United States; no individual donates anything for its support. The State, however, contributes nothing toward carrying on religious work or toward the construction of buildings for that purpose. Here is an opportunity for the farmers of Kansas to show their appreciation of the splendid work which the Agricultural College and Experiment Station is doing.

The writer is chairman of the Y. M. C. A. board of control and is personally interested in seeing this building proposition succeed. Such a movement ought to receive the hearty support of the farmers of Kansas, and the friends who assist in this movement will receive the appreciation of the Agricultural College board, faculty, and students as well as the commendation of all friends of the Agricultural College and the Y. M. C. A. throughout the State.

Yours very truly,

A. M. TENEYCK.

Following is a summary of subscriptions thus far received:

695 Previously acknowledged... \$22,332

3 Subscriptions, \$100 each.... 300

698 Subscriptions \$22,632

The amounts subscribed have ranged from \$1 to \$1000. None need hesitate because the amount he gives is small. Send to THE KANSAS FARMER, the Mail and Breeze, or to the Farmers' Advocate, Topeka, or to General Secretary W. W. McLean, Manhattan.

The convention of Southwestern interests to be held at St. Louis will convene in the Mercantile Club, corner of Locust and Seventh streets, at 10 o'clock Monday morning, April 10. Delegates, upon arriving at St. Louis, are requested to call at the office of the Business Men's League, in the Commercial Club, to register and receive badges. The banquet will be in the Jefferson Hotel, corner of Locust and Twelfth streets, at 8 o'clock Tuesday evening, April 17. A reception committee will receive and seat the guests as they arrive at the hotel. The dress will be informal.

The Farmer's Cooperative Shipping Association held its annual stockholders' meeting last week at Topeka. The former officers were reelected. It is stated that last year's business paid less than expenses; that it costs the association about a cent a bushel more than it costs the individual shipper to market grain; and that there was considerable dissatisfaction among the stockholders. The business of the association was transacted behind closed doors so that unfavorable reports may have been circulated without sufficient foundation by members of a minority faction.

Agriculture

Successful Farm Management.

W. J. SPILLMAN, UNITED STATES DEPARTMENT OF AGRICULTURE, WASHINGTON, D. C., BEFORE THE KANSAS CORN BREEDERS' ASSOCIATION, JAN. 23, 1906.

The average yield of wheat in the United States is only about thirteen bushels to the acre, while the average yield of corn is about twenty-three bushels. When we stop to think that half of the farmers who grow these crops produce less than average crops, it is easy to see that the average farm does not pay. Frequently we find two farmers side by side, one of whom barely makes a poor living, while the other makes good money. We say that one is a poor manager and the other a good manager. Some men are born good managers. There is a large number of farmers, however, who can become good managers, and doubtless a number who never will under any circumstances, but it is certainly worth while for us to consider a few of the fundamental principles underlying good management on the farm.

CROP ROTATION.

In the first place, a well-planned rotation of crops is essential. The average farmer gives little or no attention to crop rotation, and has to replan his work every year. He frequently grows the same crop year after year until the land is worn out, badly infested by weeds, and the soil becomes filled with insect pests and fungus diseases that prey on the crop grown. One year he may have twenty acres of corn and another year sixty acres. He thus frequently finds himself short of help at some seasons of the year and with nothing to do at other times. The work of a farm should be so planned that the farmer and the laboring members of his family, as well as the hired men if there are any, can find something profitable to do every day in the year. Work that can be done inside in wet weather should be saved up for rainy spells, and the farmer should plan so closely that he will never be caught napping and thus required to do a lot of work that could be just as well done at times when the main work of the farm is not pressing. A well-ordered rotation of crops utilizes the full possibilities of the soil; that is, it keeps the fields busy growing something all the time. It distributes the work throughout the year, thus enabling the farmer to hire labor by the year, a much more satisfactory plan than hiring several men for short periods. The changing of the crop on the field will also cause yields to be larger, and there will be less trouble from weeds and insects. Wherever the same crop is grown continuously on the land, a lot of weeds that are adapted to growing with that crop will creep in and make the land foul with their seeds.

USE OF FERTILIZERS.

While the well-planned rotation is essential to good management, it is just as essential that a considerable portion of what is raised on the farm be fed to live stock and the manure returned to the land. Unless this is done the land will eventually wear out. It may be stimulated for a while with commercial fertilizers, but even the use of fertilizers without manure, or other means of stocking the soil with humus, will hasten the exhaustion of the soil. There is room for the development of all kinds of livestock farming in Kansas. It is possible to keep up the stock of humus in the soil by plowing under occasional green crops, but we do not know as much as we should like to know about the value of this practice.

PRODUCTS FOR FAMILY USE.

Another essential element in successful farming is the production on the farm of as much of the food required by the family as is possible. In nearly all parts of your State a large variety of garden vegetables can be grown with very little labor and every family on a farm should maintain a kitchen garden that will grow all of the vegetables, potatoes, and the like, the family can consume. If there is a little surplus it can frequently be sold in local markets to advantage, or it can be consumed by the poultry, pigs, and cows. Every farm should have at least enough fruit to supply the family with an abundance of this healthful food at all seasons of the year. Every farm should also keep poultry enough not only to supply what the family can consume, but to pay at least the grocery bill. A well-kept garden, a

small kitchen orchard, and a small flock of poultry will greatly enhance the standard of living on the farm and enable the farmer's family to enjoy the good things of life in a way that is impossible to those who live in cities.

PROPER PREPARATION FOR MARKETING.

Another important item in making the farm profitable is the proper preparation for market of what the farmer is to sell. Some time ago I was talking with a commission man in St. Louis, and he told me of an instance where a certain firm in Southern Missouri sent a lot of peaches to market at a time when there were twice as many peaches on the market as there was any demand for, and prices were entirely demoralized. Nevertheless, this particular consignment of fruit sold for good prices, simply because it was the most attractive fruit on the market. The attractiveness of an article properly prepared for market is more than half the battle in selling it. No matter what the farmer has to sell, if it is the best on the market it will always sell above market prices.

MANAGEMENT OF SOIL.

Another very essential thing in making a farm pay is the management of the soil. A large proportion of farmers plow three or four inches deep. This is a great mistake. Nothing wears out the land sooner than to have only the surface three or four inches pulverized by the plow. A good many farmers have been misled by their own experience with deep plowing. It is a well established fact that when land is plowed several inches deeper than it was ever plowed before—this is particularly true of land that has been in cultivation for a good many years—it will not yield much the first year, and this has led a good many farmers to think that deep plowing was not beneficial. Ordinarily speaking, the best plan is to plow a little deeper every year until a depth of nine or ten inches is reached. After that fall plowing should always be deep and spring plowing should be from six to seven inches deep. It is important, too, particularly if the soil is of rather a heavy type, not to plow when it is either too wet or too dry. If a heavy soil be plowed dry, the farmer has simply a mass of clods to deal with during the remainder of the season. If it be plowed too wet, a good deal of it is puddled, and a few dry, hot days will almost convert it into brick-bats. Plowing should be done, if possible, when the land is in condition to break up mellow. In spring plowing the harrow should follow the plow immediately in order to get a good pulverization of the surface. This is not so important in fall plowing, because the freezing and thawing of the winter will melt down the clods. Not only is it important to plow properly, but the surface should be put in good condition for receiving the seed. This work is usually done with the harrow. If the plowed land has lain for several months before the seeding is done, the disk-harrow is a very useful implement in pulverizing it, but on freshly-plowed land that was in proper condition to plow, a disk-harrow is unnecessary.

Farmers who have been plowing shallow for many years find a stratum of hard pan just below the plowed stratum. A good many attempt to break up this hard pan by subsoiling, but it is doubtful if subsoiling ever pays. The object of plowing is to mellow up the soil and incorporate humus into it. Subsoiling simply opens up air spaces deep in the soil, and it does very little, if any good. The proper thing is to plow deep.

MISTAKES IN FARMING.

One of the worst mistakes a farmer makes is in working too many hours a day. In my boyhood there was a neighboring farmer who in plow time would work from four o'clock in the morning till nine o'clock at night. He was a poor man and thought he had to do this or starve. Of course, he never had time to read the papers, and he knew nothing of the improvements that were going on in the methods of farming. He plowed two or three inches deep and raised six or seven bushels of wheat to the acre. Most of his horses died of starvation and overwork, and in two years he had squandered a patrimony inherited from his father and left the country in a covered wagon with two cow-belts which were only called horses by courtesy. On the other hand, I know a farmer who has dug a farm out in the State of Washington, in a section where it would cost at least \$200 an acre to clear the land if the work had to be hired. With the exception of one hired man for six months when he first began clearing, this man and his three sons have cleared up seventy acres of land, forty

for the plow, and the remainder is in condition to furnish good pasture. Last year this farmer sold \$2330 worth of butter, a little over \$2000 worth of eggs and poultry, and about \$400 worth of pork; in all, a little over \$4700, with no labor bill to pay. This farm has always been run on a ten-hour plan. They go to work at 7 o'clock in the morning, and when they come in to supper at 6 o'clock the day's work is ended, and this has always been the case. The owner of this farm takes several farm papers and studies them carefully; his boys study them too. Not only that, but his wife and daughters, who look after the chickens, are recognized as authorities on the subject of poultry, and the farmer himself now commands a good price for all he will write for the agricultural papers. His success has largely been due to the fact that he has taken time to study the literature of his business. Unless a farmer is also a born trader and gets ahead by cheating his neighbors who do not know the value of the things they have to trade or sell, he must be a student in order to make a big success on the farm.

On the other hand, a good many farmers do not work enough. There are certain very toothsome fish that have to be caught; or there are squirrels and turkeys going to waste that must be looked after just at the time of year when the spring work is pressing. Even when they do work they frequently do not work to good advantage. The work of the farm should be planned far enough ahead so that every day's work may be made to count the most possible. This is where a systematic rotation of crops comes handy. It enables one to plan the work ahead.

Another mistake which farmers make is to allow weeds to grow in their crops. I once had a neighbor who insisted that he saved a great deal of work by letting all the weeds in his corn-field sprout and then killing them at one plowing. He did save work at both ends of the line, because his system required less plowing and also saved a great deal of work in gathering his corn in the fall. In those sections of the country where the rainfall is plentiful it has been pretty well proven that the main object of tillage is to kill weeds. Every weed that is allowed to get six inches high in a corn-field reduces the size of the ear of corn on the nearest corn-stalk. The best plan is to kill every weed while it is sprouting. This can be done simply by stirring the soil at the proper time. After the roots of a weed get three or four inches deep into the ground, it can no longer be killed in this manner. The best plan is never to let the weeds get a start.

One of the mistakes that has been made in every good section of the United States when it was first settled has been the growing of grain-crops continuously on the land. This has led to the spread of certain weeds and insects, and has worn out the soil. In my boyhood it was a common thing for farmers in Southwest Missouri to sow wheat year after year on the same field. To make matters worse, instead of plowing up the stubble soon after harvest and thus putting it in good condition for the next wheat crop, they would wait until foxtail and rag-weed had made a growth two or three feet high on the land and left enough seed for four or five wheat crops in the future. This is one of the cases where promptness saves future work.

Another mistake which is common throughout the Middle West, where timothy and clover are grown for hay and pasture, is to leave the meadow down too long. Clover usually disappears in one or two years, and the yield of timothy becomes very much reduced. Not only that, but all kinds of weeds make their appearance, and frequently half of the weight of the hay consists of weeds. It seldom pays to keep a meadow of this kind down more than two years, and on our farm in the edge of Newton County, Mo., my brother and I leave the meadow down only one year. This gives us good hay and large yields.

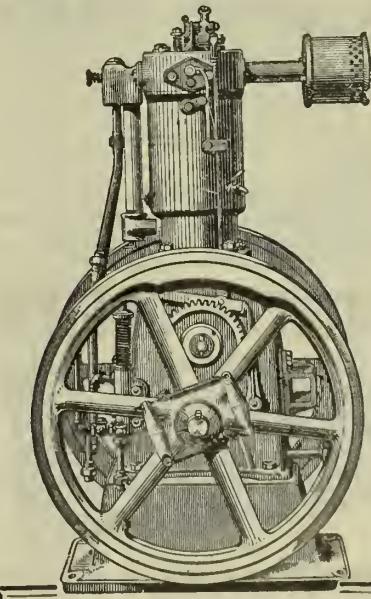

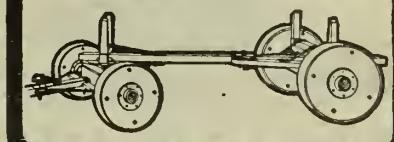

Perhaps the most common fault with farmers is that they do not study their business closely enough. A few years ago there was perhaps some excuse for not reading a great deal of agricultural literature because so much of it was theoretical and impractical. There is still, of course, a good deal of agriculture literature that is not worth the farmer's while to read. On the other hand, there are certain farm papers and books which a farmer can not afford not to read. The man who makes a great success at anything is always a thorough student. In addition to reading at least two or three good farm

Every farmer knows the labor-saving advantages of a low-down, wide-tire, short-turn, roomy wagon. The point he wants to decide is whose make will give him the most service. If he will investigate the Farmer's Handy Wagon that is made in Saginaw, his own good judgment will direct him to a wise purchase. We can't give detail descriptions of it here. We can't tell you all the reasons why it is better value for the money, why it lasts longer, carries bigger loads, requires less repairs, but all this and more is in our new 1906 wagon catalogue which we will send free on request. A postal brings it and it will pay you to send for it right now. It's full of practical wagon buying advice. Sold by all dealers.

WOOD OR STEEL WHEELS

Gasoline Engine Superiority

When a man invests in a farm power, he owes it to himself to get the best that can be bought for the money.

The modern business farm can no longer be successfully operated without a power of some kind.

The best, most economical, and safest farm power is a gasoline engine.

The best engine is the

I. H. C. Gasoline Engine.

Why? Well, because it's so simple, easily kept in order and operated definitely.

It develops the full rated horse power and sustains it against the heaviest load.

It is safer, cheaper and more efficient than steam power.

It is adaptable to any and every use requiring a power.

Among its many uses may be named:

Shelling, Husking and Shredding Corn; Grinding Feed; Cutting Dry Fodder and Ensilage; Pumping; Sawing Wood; Separating Cream, Etc.

I. H. C. engines are made in the following styles and sizes:

Vertical, 2, 3, 5 Horse Power.
Horizontal, Portable and Stationary, 4, 6, 8, 10, 12, 15 Horse Power.

If interested in powers in any way, go to the International Local Agent and have him show you the I. H. C. gasoline engine, and supply you with catalogues, or write for further information.

papers regularly, every farmer ought to get the bulletins from his State Experiment Station and some of the bulletins from the United States Department of Agriculture. He should also attend the farmers' institutes and take an active part in them. By these means he can keep himself informed concerning progress that is being made in the great industry he represents, and will be in position to improve his methods as fast as new facts are developed.

Corn-Stalks as Fertilizer—Night Soil.

There are about 40 shocks of corn-fodder no this farm, about one-half has been fed out. What is the most convenient way of decomposing the stalks so they can soon be returned to the soil as fertilizer?

What are the proper things to mix with night-soil for use in the garden? Wood-ashes and forest-tree leaves are about the only things I could get. What proportion of these three mixed together would give the best results, and what length of time should be allowed for composting?

FRANK S. GRISWOLD.

Johnson County.

The corn-stalks might be spread at once on pasture land, or if you do not have such land available, spread thinly on wheat or small grain which has just been sown. Used in this way, the stalks will not be in the way and will give some little benefit to the land, both in the way of a mulch and as they gradually decay some humus and nitrogen will be returned to the soil. The fertilizing value of corn-stalks is not great and it would not seem to me advisable to decompose the stalks previous to using them as fertilizer. Of course, the stalks could be thrown into a pile and allowed to absorb the rains during the summer and thus gradually decay. However, corn-stalk manure is always disagreeable to handle and you will probably be able to handle the stalks from the shock easier and at less expense than you will ever be able to handle them again.

Wood-ashes are not very desirable to mix with night-soil; air-slacked lime is better. The wood-ashes decompose to some extent the nitrates of the fertilizer. The forest-tree leaves are all right. By adding a little road dust or dry dirt, leaves and night-soil will make as good a combination for hauling for garden fertilizer as anything you can use. You will best be able to judge what proportions to use to secure the best mixture. Usually it would not appear to me desirable to go to any great trouble in composting this night-soil since you really have only a small quantity of the fertilizer.

If it could be hauled out into the field and spread thinly and plowed under, perhaps this would answer your purpose and be a desirable way to handle the fertilizer. Any other fine, well-rotted manure would be as good for the garden.

A. M. TENNEYCK.

The Hessian Fly.

The following and other enthusiastic statements concerning a parasitic enemy of the Hessian Fly possess so much importance, if true, that THE KANSAS FARMER asked Professor Tucker for a discussion of the subject. His excellent reply follows the clipping:

"The passing of the Hessian fly has for years been the dream and cherished hope of the wheat-grower. As the wheat crops increased and the demand and prices became more of an incentive to increased acreage and yield, the threatened destruction of crops by this insect pest became more pronounced and alarming over the winter-wheat areas. The fighting of the Hessian fly by all scientific and mechanical methods and contrivances that scientists could invent did not offer much encouragement of perfect immunity from the pest, while it added labor and embarrassment to the best interests of the successful cultivation of the crop.

"The Department of Agriculture at Washington, D. C., has discovered through its agency an insect enemy of the Hessian fly which promises its hasty and permanent destruction. The tiny insect upon which the Government entomologists are depending to check and possibly destroy completely the Hessian fly is the *Polygnotus hiemalis*, and it is indigenous to Montana, North Dakota, and Idaho, where it was discovered during the summer of 1905 by G. L. Reeves, of the bureau of entomology of the Department of Agriculture, while on field work connected with investigation of the Hessian fly.

"The *Polygnotus hiemalis*, while boasting of a formidable polysyllabic name, is of almost microscopic proportions. To the unaided eye it appears hardly larger than a pin point, and a Hessian fly attacked by hundreds of the parasites looks as if it had been

sprinkled with pepper. When the parasite is brought under the lens of a powerful microscope, it is discovered to have a pair of powerful mandibles and six strong gripping legs by means of which it is able to satisfy its lust for Hessian steaks and delicacies offered by its doomed host. So voracious is its appetite and so effective is its warfare upon the Hessian fly that the great wheat-pest has been practically exterminated in the districts it has invaded where the newly-discovered parasite is indigenous.

"This new field for importation and distribution of the newly-discovered insect will offer the experiment stations throughout the winter-wheat States employment in the propagation of the *Polygnotus hiemalis*. It is to be hoped that they are not too sensitive to changes of location, and will have to undergo a gradual process of acclimation before they will be ready to enjoy feeding on the Hessian fly, as it may be found in the various localities where it does its work."

An Important Enemy of the Hessian Fly and Other Parasites.

BY ELBERT S. TUCKER, MUSEUM ASSISTANT IN SYSTEMATIC ENTOMOLOGY, UNIVERSITY OF KANSAS, LAWRENCE.

Ofttimes exaggerated and otherwise faulty accounts are printed in newspapers and other journals regarding investigations that promise to be of practical value if applied to farming practice. Perhaps these articles are written with the best of intentions towards spreading the news, but the writers jump at unwarranted conclusions and probably err from a lack of sufficient knowledge of the subject or incomplete understanding of facts. Such appears to be the case recently noticed concerning reports of an important enemy of the Hessian fly. As efforts have been made by the entomologists of the U. S. Department of Agriculture to prove how effective this enemy can act, their opinion was sought in order to determine what statements can be relied upon. The reply received which answered a number of questions is here quoted:

"Bureau of Entomology,

Washington, D. C., March 23, 1906.

"The parasite of Hessian fly to which you probably refer is *Polygnotus hiemalis* Forbes. Please absolve me from any claims or statements made in newspapers. This is a very common parasite, but if it ever made any promises to exterminate the Hessian fly we have never received them, certainly not in Montana, where no wheat is grown, and I do not believe in the Dakotas. Furthermore, Mr. Reeves wishes to be absolved from all responsibility of its discovery. As you probably know, this was described by Professor Forbes a number of years ago.

"It is an exceedingly valuable parasite, and I have observed it overcoming an invasion in the fields; that is to say, fall wheat that had been killed by Hessian fly was collected from widely different localities and placed in breeding in an insectary. In some cases the number of these parasites reared outnumbered the Hessian fly reared, two or three hundred to one. Part of these could, of course, be accounted for from the fact that quite a number of parasites may be developed within a single flaxseed, but it occurs too often to be a mere theory that where Hessian flies are excessively abundant in the fall sometimes very few emerge in the spring, while swarms of these little fellows come forth in their stead.

"I am not certain of its occurrence in Kansas, but think it quite likely that it occurs there. This is the one that was sent from North Dakota to Kentucky, Tennessee, and also to California.

"So far as my own studies have gone, this is the most valuable of the several parasites of the Hessian fly.

"I presume that you can secure a figure of it by addressing the Bureau, although you may perhaps have to wait until a circular in which it is being used has passed through the press.

"Yours very truly,

"F. M. WEBSTER,
In charge Cereal and Forage Plant
Insect Investigation."

The official account of the Government experiment in disseminating these parasites appeared in Dr. L. O. Howard's report for 1905, and reads as follows:

"Introduction of parasites.—By keeping the whole wheat-growing area under observation, carefully noting the increase and abundance of grass and grain insects in one section and the decrease on account of excessive parasitism in another, it may be possible to transfer large numbers of beneficial

The Apex Mfg. Co., Bloomington, Ill.

Insects from the locality where they have nearly or quite finished their task of suppression to another region where an outbreak is in the developmental stage. During the season two large consignments of Hessian-fly-infested wheat-stubble, determined by breeding during the winter months to be strongly parasitized, were transported from North Dakota to Western Kentucky and Tennessee, where a serious outbreak of Hessian fly was then in progress. The results have not yet been determined, but the line of experimentation is a worthy one."

We hope to hear of the successful outcome of these experiments from the bureau itself before long. The discovery of this species of parasite dates back many years, although reputed in the clipping at hand to be only last season. In Bulletin 45, U. S. National Museum, its history is thus traced by Dr. W. H. Ashmead:

"This species seems to have been first reared by Dr. Riley from specimens of the Hessian fly (*Cecidomyia destructor* Say), August 16, 1876, received from Blair, Nebr. It has, however, since been bred from the same fly by various persons in the Western States. Professor Forbes reared it in 1888 at Champaign, Ill.; Professor Cook, of Agricultural College, Mich., in 1890; and Professor Webster at Laporte, Ind., in 1889."

Its occurrence in Ohio was noted by Professors F. M. Webster and W. Newell in their report on insects of the year 1901, (published in Entomology Bulletin 31, U. S. Department of Agriculture), in the following manner:

"Wheat plants that had been killed last autumn by the larvæ of the fly were collected in quantity from many sections of the State and placed in the insectary in order to learn the probable condition of the fly in the fields in the spring of 1901. Only in two instances did we secure Hessian fly in great numbers. * * * In some instances we reared myriads of the little parasite *Polygnotus hemalis* Forbes, and the number of these left no doubt of their efficiency in checking the increase of the fly; but in some other cases we reared only very few parasites, and even less flies or none at all, so that it seems possible that there was also another unknown influence which tended to reduce the number of adult flies that emerged this spring."

In classification, this insect belongs to a family of the parasitic wasps called Proctotrypidæ, which, according to Professor Comstock, includes the smallest of all known insects. Many of them are small enough to live even within the eggs of other insects. In size, the enemy of the Hessian fly is, of course, much smaller than its host which is a tiny insect itself; the measurements of the adult parasite are given as .80 to 1.40 millimeters in length.

Our most beneficial insects are the hymenopterous or wasp-like parasites of which this enemy of the Hessian fly is an example. Numerous kinds abound everywhere and they not only prey on other insects, but also on each other. Caterpillars are especially susceptible to their attacks. However, they do not pounce upon and kill their prey at once by biting according to the idea conveyed by the newspaper articles—that is the method of attack by predaceous insects. Parasitism is a slower process of onslaught and is exemplified by any form which subsists largely by attachment on or directly within the body of another, during a part or whole of its life. With the hymenopterous parasites, the female selects her victim usually when she is in the larval or worm stage, though often in the cocoon or pupa, and by means of her piercer thrusts one or more of her eggs into the skin of the host. These eggs hatch out into grubs which burrow into the live body and feed on the blood of the host until their growth is attained. By this time the victim generally dies, but the parasites transform into adult flies either within or outside the body of the host. Their jaws are then used to gnaw their way out of the victim's body or to free themselves from their own cocoons, when formed externally. No matter how small some species may be, they are just as complete in structure as large insects. Except for a few wingless forms, they have four wings. The females apparently loose no time in hunting for victims on which to deposit their eggs, thus quickly producing another brood. Night-time is probably the period of greatest activity with the adults, for at such times I have captured great numbers of them either by sweeping herbage with a net or in collecting at lights. Then again, some species were reared in breeding experiments such as raising a colony of caterpillars in a cage, when parasites are liable to develop from them.

Not all the attention that they deserve has been given to these parasites, but recently a great number of specimens of these insects belonging to the collection of the University of Kansas were studied by a specialist with remarkable results in finding many kinds that are new to science. The notes and descriptions concerning part of them were published a year ago in the Transactions of the Kansas Academy of Science, (vol. 19), which report shows that our Western country is rich in new species. As fast as my own captures are reported, from material collected in Kansas and Colorado, more than two new species were found to one old species, or by actual count, 39 to 18. In one family called Ichneumonidae, 15 new species are credited to me as the collector; one is named after me and another after Manitou, Colorado, where it was found. In another family called Braconidae, 24 new species are described from specimens of my collecting, among which another namesake appears, besides one named after the State of Kansas and another after Wichita, Kansas where it was taken.

These Indian names with Latin terminations form curious combinations, as Kansensis, Wichitensis, and Manitouensis.

Since the collecting was mostly desultory, being done during spare time and on pleasure trips, the results are the more surprising; besides my attention was not given to parasites alone, but to all orders of insects, although I often made special efforts to collect minute forms. The locality, Lawrence, or Douglas County, Kansas, becomes prominent because most of my collecting was done here at home, when after my day's work in the museum, a change in the open air was afforded during evenings. I believe that innumerable unknown species of these parasites still remain to be captured almost anywhere.

As all these parasites enter into economic importance by reason of their agency in the limitation or suppression of more or less injurious hosts, the field for investigation in this direction seems to offer great possibilities, at least for a better knowledge of them and perhaps to some practical purpose. Possibly the control of destructive hosts can be effected through their agency by artificial means. Field agents are already engaged in special investigations in various States. Kansas has her troubles, too, with insects, and offers a good working field for several special investigators.

Water-Proofing Boots and Shoes.

To prepare a dressing that will render leather boots and shoes water-proof, and which is not injurious to the leather, leaving it soft and pliable, use oil and rubber as follows: Heat in an iron vessel either fish oil or castor oil, or even tallow to about 250 deg. Fahr.; then add, cut in small pieces, vulcanized or raw India rubber to the amount of one-fifth the weight of the oil, gradually stirring the same with a wooden spatula until the rubber is completely dissolved in oil; lastly, to give it color add a small amount of printer's ink. Pour into a suitable vessel and let it cool. One or two applications is sufficient to thoroughly water-proof a pair of boots or shoes for the season. Boots and shoes thus treated will take common blacking with the greatest facility.—Scientific American.

This actually appeared among the editorial notes in the Emporia Gazette: "This actually happened. A farmer's cattle broke into a neighbor's field of corn and the neighbor filed suit in a justice court. Appraisers appointed to assess the amount of damage done to the field of corn, on examination found that the cattle had been in that field but had not eaten an ear of corn because they couldn't reach it. They decided that no damage had been done and the suit was withdrawn."

From Nottingham, England, comes the description of a telephone apparatus designed to obviate the possibility of disease transmission by the usual mouthpiece. The construction is such that the mouthpiece is omitted altogether, and the receiving and transmitting apparatus is combined in a small metal case, shaped like a watch. This is held continuously to the ear, both in speaking and in listening, the transmitting microphone being made so sensitive that it becomes unnecessary to concentrate the sound waves on it by the aid of any mouthpiece such as is ordinarily used.

Make yourself a necessity to the world by what you contribute in the way of personal comfort, by what you are in embodying before men all that is gentle, generous, and pure.—M. Dane.

Use this American Manure Spreader

A MONTH FREE

TO PROVE ALL THE CLAIMS WE MAKE FOR IT

WE sell direct to you. We sell direct to you because we are able to give you much better value for your money than we otherwise could, and a better understanding of your machine than any one else could. We always keep in close touch with our customers. They tell us what our Spreaders are doing. Sometimes they surprise even us.

We find out just what it means to countless farmers to own a Manure Spreader that will double the value of every bit of manure put on their land. The American Manure Spreader will do this because it breaks up and pulverizes all the manure so that it mixes readily with the soil. It distributes evenly. Every square foot of land gets its share. This means a good crop all over the field. You don't find any "skinned" places in a field manured with the American Spreader.

But we don't ask you to take any hearsay evidence.

We want you to *find out for yourself* what our Manure Spreader will do.

So we make you this remarkable offer. We will send you one of our Spreaders on trial and prepay the freight.

Use it a month on your own farm.

If you find it exactly as we have represented, after the month's free trial, you can settle for the machine on terms convenient for you.

But if the American Manure Spreader is not what we claim, send it back at our expense. You don't owe us anything. The trial don't cost you a penny. The month's use you have had of the Spreader is FREE.

Could we do more to prove to you that the American Manure Spreader, is what we say? Would we dare to make such an offer if we didn't know what our Spreader will do? Remember—when you deal with us, you are doing business with an independent concern.

And you take as much time as you require to pay for the Spreader after you have used it **A MONTH FREE**.

The Spreader may earn its own cost, before we send us a shilling.

Will you be as fair with us as we are willing to be with you?

Will you send for information of our generous proposition today?

Even though you do not wish to buy now, send for particulars.

Some day you may wish to buy, and then knowledge of our New Selling Plan will come in handy. You will know how to save money.

If you will tell us how much land you own, and how many horses, cattle, sheep and hogs you keep, we will give you the Government statistics as to the value of your manure crop.

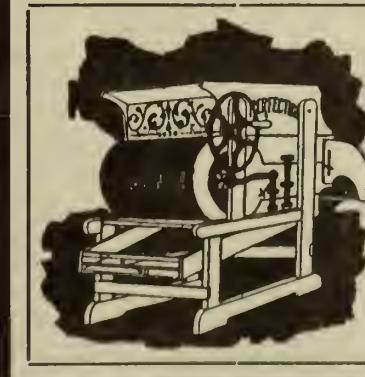

Write to us today. Put down this paper and write before the matter has a chance to slip your memory.

Address at once—

AMERICAN HARROW CO., 10133 Hastings St., Detroit, Mich.

Do You Know?

That one handful of noxious weed seed to a bushel of your grain, if planted, will absolutely ruin the crop. There are many cleaners that will remove all but that last handful of the weed seed from your grain, but the "Perfection" is the machine that does the work the way it should be done. Better own the machine that is easy to operate, easy to understand, and yet does its work so perfect that your crops are increased 25 per cent to 50 per cent. :: :

A "Perfection" cleans, separates and grades anything from Corn to Red-Top.

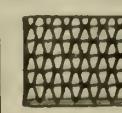

Write us today and we will tell you what it will do as well as show you how it does it. Be sure and tell us the kind of grain you raise.

Alfalfa for Steers.

EDITOR KANSAS FARMER:—I have been feeding 16 4-year-old steers for about three months on alfalfa hay and corn-meal. I am feeding corn-meal morning and night, 5 bushels a day, and alfalfa hay three times a day. Some of these steers have been bloating. This morning after eating their corn-meal and alfalfa hay, two of them were pretty badly bloated. I understand nearly everyone is feeding all the alfalfa hay his stock will eat with-

B. W. Harned, of Beaman, Judge L. L. Frost, of Mirabile, Mo., in a letter to the directors stated that the O. I. C. swine-breeders had made arrangements to participate in the show. The Poland-China breeders were not represented, but it was understood that they would come in. It is expected that the classifications will call for \$500 in cash prizes, in addition to a number of specials for each breed. To encourage the swine-breeders to make a large exhibit, General Manager Rust of the stock yards company announced that the pen rent would be reduced from \$3 to \$2 per pen.

Prof. R. J. Kinzer of the animal husbandry department of the Kansas Agricultural College made a plea for the students' judging contest. He said he had assurances from the Missouri, Kansas, Oklahoma, Texas, and Colorado colleges that they would send teams. The contest will be held on Saturday, October 6. Team and individual prizes will be awarded, the contest being open to all.

At the request of the shire exhibitors, separate classifications will be provided this year for Shires and Clydesdales. H. A. Heath, of Topeka, Kans., was selected as superintendent of the horse department. The prizes in this

the great breeders and improvers of our domestic animals that they were close students of animal form and conformation. They were not satisfied with a general knowledge but carefully noted the most minute points in their bearing upon other parts. This careful study and realization of the value of the points quite often regarded as unimportant gave these men clearer understanding and greater appreciation of the details of conformation. The great breeder is a close student of animal anatomy and has a thorough knowledge of the fundamental principles governing and influencing quality, symmetry, and the correlation of the various parts of the animal mechanism. A careful study along these lines plainly shows us that a perfect harmony must prevail throughout the animal economy if we are to have the highest utility with least friction of parts. The term conformation as applied to animal form should be used in its broadest sense, and should include the outside form in its relation to function, locomotion, and adaptation for specific purposes. There have been enthusiasts who claimed conformation to be an absolute index to function and adaptation. The experience of practical stockmen is oftentimes contradic-

out danger, but our stock is bothering us a great deal. We had the same trouble last year. I would like to know the cause of it. My alfalfa, which was grown on upland, is very short and full of leaves. Is this the cause of the trouble? I think after this I will mix the alfalfa with straw.

Lincoln County. OLE NIELSON.

Answer:—When steers are on full feed with alfalfa hay for roughage, they will occasionally bloat. Your alfalfa is undoubtedly of very rich feeding value and I would suggest that you feed some other roughage in addition, as straw or good prairie hay. It would be safer, also, if you were feeding corn- and cob-meal instead of clear corn-meal.

I think you will find that, if you reduce the quantity of alfalfa somewhat, giving some other roughage to take its place, the bloating will cease.

S. C. WHEELER.

About the American Royal.

EDITOR KANSAS FARMER:—A strong show of breeding swine, a students judging contest, and an enlarged classification in the horse department will be the new features of this years' American Royal Live-Stock Show to be held at Kansas City, October 6-13. These, with many other important details, were passed upon at a meeting of the directors held at the Midland hotel yesterday.

The swine-breeders were represented by the following: N. H. Gentry, Sedalia, Mo., and L. E. Frost, Moberly, Mo., chairman and secretary, respectively, of the swine department; W. L. Addy, of Parnell, president, T. L. Williams, of Dawn, secretary, and C. B. Fagin, of Iathrop, director, of the Missouri Duroc-Jersey Breeders' association; and Green McFarland of Sedalia and

department will aggregate \$8,560, including \$400 for mules. A bar for the accommodation of the show horses is to be erected within the show-grounds.

Three night shows will be held this year. They will be on Tuesday, Thursday, and Friday nights.

JOHN M. HAZELTON,

Kansas City, Mo.

Judging Poland China Swine and Use of Score-Card.

PROF. G. C. WHEELER, BEFORE THE FARMER'S INSTITUTE AT CLAY CENTER, KANSAS.

In all live stock judging there are two faculties essential above all others, namely, observation and judgment. No man can successfully judge animals who can not quickly see the different points upon which he must base his final conclusions. While this faculty of keen observation seems natural to some, it may be greatly developed by practice and continuous use especially when this takes place under the direction of some thoroughly competent person.

It is also absolutely essential that an ideal be clearly present in the mind's eye in order that any deviation from correct form be quickly noted. This is one of the most difficult things to acquire in connection with forming correct conclusions as to animal form. It requires close observation and study, and considerable experience. After a clearly defined ideal has been fixed in the mind as a result of careful study and observation of the highest types and forms, it but remains for the keen eye to detect the various deviations from this ideal and render the decision in accordance with the amount and importance of the departure from the correct conformation.

ANIMAL FORM AND CONFORMATION.

We find as we study the work of

tory to this over-zealous claim, and consequently some have considered that the study of conformation is unimportant. It may be said that conformation is rather the result of function, and looked at from this standpoint its importance is more easily realized.

It is very important that a breeder be a skillful judge, in fact, a man who is not hardly merits the title of breeder even though his operations are with pedigreed animals. You gentlemen, who are striving to advance the value and general utility of the Poland-China breed of swine, realize that you can accomplish but little unless your knowledge of the conformation of your chosen breed is sufficiently accurate to enable you to see not only the defects of the living animal as produced in your herds, but those which the slaughter test alone will expose.

THE IDEAL HOG.

The market demands have much to do with moulding our ideals and a close study of the standards for the different breeds reveals the fact that in so far as the points relating to the real meat-producing parts are concerned they are almost identical. At present, the distinctly lard-type of hog is favored in the Central West and the Poland-China breed, as now produced, is admirably fitted to meet the requirements. It should be the steadfast aim of you breeders of this grand corn-belt hog, to adhere closely to correct ideals. You must not be satisfied to produce individuals as good as your parent stock. There is no stationary ground for the true breeder. There must be improvement; and this improvement must be harmonious and symmetrical. The charge is made that the Poland-China breed is not prolific.

Dipolene

WILL SAVE YOU DOLLARS

By preventing loss and sickness among your farm animals. Time to save is before loss occurs. Keep your live stock free from disease. DIPOLENE will do it. It kills disease germs, destroys ticks, lice, fleas; cures sheep scab, mange, eczema. Protects against mosquitoes, and keeps stock in a healthy, sanitary condition. It's easy to use, powerful, sure and pure; DEATH TO DISEASE but perfectly harmless to animals, hair, feathers or wool. A gallon makes 100 gallons dip. Write for price and FREE book, "DIPPING FOR DOLLARS."

Most complete veterinary book ever printed to be given away. Durably bound, indexed and illustrated. Write for a free copy.

FLEMING BROS., Chemists,
212 Union Stock Yards, Chicago, Ills.

If this be true, it is up to you breeders to correct it, for of what avail is it to develop the finest type of hog that grows if it is unable to reproduce at a profitable rate? You must become breeders in the highest sense and in order to do this, as already stated, a thorough knowledge of the animal in all its details and functions is absolutely necessary. This brings us back to the subject of this paper, namely, the judging of Poland-China swine and especially the use of the score-card as an adjunct to a proper estimate of the various points of the animal.

USE OF THE SCORE-CARD.

At our various agricultural colleges, the subject of instruction along animal-husbandry lines has made great progress during the past few years. It is a subject of great value to our agricultural interests and instruction in the principles of stock-judging is an important part of the work, as the future success of the stock grower and breeder is much influenced by his knowledge of what constitutes superior form and quality in animals. Expert judges, however, can not be made of every student given instruction along these lines, but he is started along the right road and as the after years give added experience, he can acquire a higher degree of ability in the knowledge of animal form and function.

In this instruction work the score-card fills an important place. The discussion of its use which follows will be mainly from this standpoint. As a means of placing animals in the show-ring it is used with poultry only. A National association of expert swine-judges exists and an effort is being made to so systematize the methods of scoring swine as to enable judges to use this method in the show-ring. As yet, it has met with no practical application. With a ring of thirty or forty animals before him, an expert judge can much more quickly and surely pick the best individuals and rank them by the ordinary method of comparative judging. The expert judge who goes into the ring with a clearly defined mental ideal is able to measure each individual by his mental conception and in so doing unconsciously applies the score-card without being hampered by its objectionable features. As an educator the score-card is of great value to the student, both the young man in college and the student in the great practical school of life, for we all must ever remain students if we would make any progress.

The score-card with detailed description, which you hold in your hands, is the one prepared by the National association of expert swine-judges for the Poland-China breed. It has been prepared and arranged with much labor by the association and has been several times revised. Each of the Poland-China record associations have a different scale of points and this multiplicity of record associations and numerous standards is one of the serious difficulties with which the breed has to contend. The standards adopted by each have gradually drawn together, however, until now they vary but little. Already one step toward unity has been accomplished by the consolidation of the Ohio and the Central-Poland-China Record associations and it is to be hoped that the breed may soon be released from this hampering influence. The score-card as given is an effort to describe in words, point by point, the ideal Poland-China hog. By a rigid application of the ideal there is probably not now a hog in existence which should receive a score of over 85 or 90 points. In its application, granted that the student is able to see correctly, the first thing to do is to learn thoroughly the different points and also their comparative value which are indicated by the number following each head at margin of card. For example we note that the back and loin is allowed fourteen points and the ideal is described as, broad, straight or slightly arched, carrying same width from shoulder to ham, surface smooth, free from lumps, creases, or projections, not too long, but broad on top, indicating well-sprung ribs; should not be higher at hip than at shoulder, and should fill out at junction with side so that a straight edge placed along at top of side will touch all the way from point of shoulder to point of ham, should be shorter than belly line. If a careful study of the individual shows that the back and loin vary from the ideal by 2 per cent, we would cut the fourteen points 2.8 or in round numbers three points, leaving its value as eleven points. Noting the neck we see it has a value of two points and the ideal is described as follows: Short, wide, even, smooth, well arched; round-

ing and full from poll to shoulder, with duo regard to characteristics of the sex. If we find our individual varies here from the ideal by 2 per cent the cut would be but 4 or in even numbers one-half point off, leaving the value one and one-half points. If we found the neck departing widely from the ideal, say to the extent of 50 per cent, the cut would be one point. Practice in the use of the score-card will tend to fix these relative values of the different parts firmly in mind. It leads to an analytical method of studying the individual, point by point. The student learns to overlook quite serious deviations from the standard upon some minor point provided the animal is very strong in the important points. The end of all work is the packing-house and the standard of utility is after all the final value of our animals. No doubt there are some present here to-night who have allowed some unimportant feature to become a hobby which has been ridden to the detriment of the animals bred as a whole. Almost all breeds of animals have suffered at some time or other from false standards in the form of fashionable families or fads of one sort or another which have not had a solid foundation to build upon, and the Poland-China breed of swine has not been exempt from these departures from the straight and narrow way which leads to greater utility and better adaptation to the special purpose of pork-production. As we study the score-card it is a great advantage if we can have some animals as nearly perfect as possible in order that the eye may be impressed with the ideal. The student studying this subject will do well to visit famous herds and shows in order that he may feast his eyes upon animals of high degrees of excellence. You positively can not produce a high type of hog unless you know what constitutes a good animal, and the time given to a careful study of the subject is well spent.

It is rather unfortunate that as yet no accurate standards of measurements have been agreed upon for our different types of animals. The taking of measurements is of great value, however, to the beginner and a study of the relative proportion of the parts and the various contour lines of the animal by means of the tape-line will aid greatly in training the eye to detect small differences and correctly estimate dimensions of the various parts.

In making a study of the individual animal, it is important that it be looked at from the correct view-points in order that a clear idea be obtained of the complete development of each part. There are four principal points of view, namely, the front, rear, standing at side and looking down upon the back, and a side position, half kneeling which gives a view of the underline. Viewed from these four different points we are able to note the full conformation of each part, and also the symmetry and relation of the parts as a whole.

In our college work we gradually lead the student away from the score-card as he grows in the ability to carry a mental picture of the ideal in mind and correctly estimate the departure from it in the individual animal. The score-card is used to establish fundamental principles and to direct the habits of observation in a systematic manner, rather than as a means of placing animals in the show-ring.

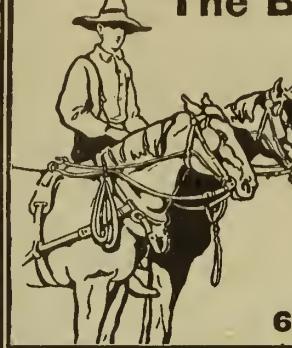

It is to be hoped that the cards which have been distributed will be preserved and carefully studied along the lines suggested. A faithful effort to know more of your chosen breed will surely bring its reward.

THE SCORE-CARD USED BY STUDENTS IN JUDGING POLAND-CHINA HOGS.

1. HEAD—Broad, even, and smooth between and above the eyes; face slightly dished, tapering even and gradually to near the end of the nose. Broad lower jaw..... 4
2. EYES—Full, clean, prominent, and expressive 2
3. EARS—Standing up slightly at the base to within two-thirds of the tip where a gentle break or drop should occur; medium size, thin, and fine. Slightly inclined outward 2
4. NECK—Short, wide, even, smooth, and well arched 2
5. JOWL—Full, broad, deep, smooth, and firm; carrying fullness back to near point of shoulders.... 2
6. SHOULDER—Broad, and oval at the top, showing evenness with back and neck 6
7. CHEST—Large, wide, deep, and full; even underline to the shoulder and sides with no creases. Brisket, smooth, even, broad, and extending well forward 12

are bred by Mr. Allen. In preparing his sale catalogue which is now out of print and ready for distribution, there is given the breeds of both dams and sires, which is more than is often given in sale catalogues, for very few breeders have cattle as well-bred in Scotch lines as Mr. Allen has in his herd. In this offering are a number of show cattle and several herd-headers, of which special mention will be made in the next issue. In the meantime, study the sample pedigrees given in the advertisement each issue, send for catalogue, and plan to attend the sale of the purest Crickshank cattle ever offered in the West.

The Marshall County Hereford Sale.

The Marshall County Hereford Association held its fourth annual sale at Blue Rapids, Kansas, last Saturday. Their offering was one of the good ones of the season consisting of animals by such sires as May's Keep Qn, Edwardo, Pontiff, Rancher, Baccalaureate, Governor, Philetus, Senator, Mytern, Monarch, and Elvira's Java, who sprung from the best Hereford blood in the country.

While the prices were not as high as the same class of animals have brought at other sales this winter, the members of the association were pleased with the results of the sale, and every man who purchased an animal went away feeling that he had secured an unusual bargain, and that every animal that went through the ring was a credit to the integrity and ability of the members of the association as breeders of white faces.

Those who are familiar with the history of this association point to it with pride for they feel that it is one of the great Kansas institutions that has sprung up and continued to do business under the most trying difficulties. Its first sale was held some years ago first on the eve of the great depression in the cattle business. At that time nearly all of the consignment went to local parties who, when the depression came, sold them at whatever price they could get. The result was that the association's first consignment was not permitted to go out and make a name for it, but notwithstanding this, at each succeeding sale buyers began to come from a distance and at the one first held, purchasers were present from Kansas, Nebraska, Texas, and Missouri, and nearly a carload of the animals sold were at once shipped South to be used as herd-headers in Old Mexico.

We predict a great future for the Marshall County Hereford Association. It is made up of men and women of integrity and ability. They are the kind of people who do things, and they are bound to succeed.

The following persons were the contributors to the sale. Miss Lou Gobbin, A. Brook, Geo. E. Miller, E. R. Morgan, Brown Bros., Renwick McKee, W. A. Gilson, L. P. Larson, Cottrell Bros., P. A. Abrant, W. T. Strange and Son, Miss Florence Preston, and F. W. Preston.

Among the buyers were Axtell Edmund, Cleburne, E. Ileneburg, Wheaton, A. T. Vilander, Irving, Thos. Nugent, Holton; Hurt & Swanstone, Booneville, Mo.; Samuelson Bros., Bala, Kans.; Wm. Moss, Alma; A. V. H. McClure, Republic; Swen Olson, Manhattan; O. C. Lund, Randolph, Thos. Seulier, Blue Rapids, John Villeer, Cleburne, W. A. Gilson, Blue Rapids, E. Blanchard, Friend, Neb.; Theo. Welchelbaum, Ogden; Wm. Phillips, Stockdale; J. G. Arbuthnot, Haworth; Carl Hawkinson, Randolph; E. Miller, Blue Rapids; W. B. Hunt, Blue Rapids, A. Fagler, Wakefield, Wesley Rush, Tulsa, Tex.; John Erickson, Waterville; B. Spratt, Blue Rapids.

The Johnson County Sale.

Slowly, but with the assurance of success which a fair sale a square deal give to such an undertaking, the Johnson County Fine Stock Association is building up a business of association sales at Olathe, Kans. The second of the series was held Friday and although some things went low everything in the barn was sold and neighbors as well as visitors were given to understand that if bargains were to be had they could get them by being on the ground. For the most part the Shorthorns sold fairly, considering condition and quality, but in the Hereford section a number of very creditable things were offered which did not nearly bring their value. Prices ranged from \$100 down to \$25, several selling at the higher figure. Perhaps the best bargain of the sale was the handsome young cow, Scottish Star, with young calf at foot by Lord Banff 2d. She was consigned by H. E. Hayes of Olathe, Kans., and sold to A. L. Sherman of Lenexa, Kans., for \$95, probably \$75 under her value on the basis of the sale.

Contributors to the sale were J. L. Hoover, Gardner, Kans.; A. B. Kelsey, Gardner, Kans.; A. J. James, Lenexa, Kans.; J. W. Fergus, Lenexa, Kans.; G. P. Kelleher, Springhill, Kans.; A. M. Cooper, Olathe, Kans.; J. F. Hastings, Edgerton, Kans.; J. L. Williams, Olathe, Kans.; G. B. Little, Olathe, Kans.; J. B. Dickson, Edgerton, Kans. H. E. Hayes, secretary of the association, managed the sale.

Among the buyers were; J. H. Powelson, Gardner, Kans.; Schell Case, Olathe, Kans.; A. S. Catlin, Olathe; F. X. Kelly, Gardner; M. C. Reed, Olathe; Scott & March, Belton, Mo.; Geo. W. Aalsworth, Olathe; W. W. Stine, Gardner; H. M. Hill, Lafontaine, Kans.; Nat Lee, Gardner; G. Goode, Olathe; Chas. McFarland, Olathe; Jim Boon, Olathe; A. J. Calvert, Stillwater, Kans.; F. McCarty, Edgerton; K. W. Stern, Gardner.

Shorthorn Sale at Hiawatha.

The first annual sale of the Brown County, Kansas, Breeders' Association will be held at Hiawatha, Kans., on April 19. This is one of the best opportunities. Shorthorn men will have a chance to buy the best from eleven of the leading herds of Shorthorn cattle in Kansas, Nebraska, and Missouri at one sale. The very best animals from each herd are going to be consigned to this sale. Mr. Everett Hayes is the manager and is also a breeder of fine Shorthorns and will consign six head to the sale which we will mention

later. There are in all 52 head to be sold, of which 21 are bulls and the rest females. They are all either straight Scotch or Scotch-topped and represent some of the very best blood in this country. The following prominent breeders will consign cattle to this sale: G. Y. Johnson, of Willis, Kans., consigns 4 bulls and 6 females; Everett Hayes, of Hiawatha, Kans., 2 bulls and 4 females; Jas. P. Lahr, Sabetha, Kans., 3 bulls and 3 females; Bert K. Wise, of Reserve, Kans., 1 bull; Geo. Manville, of Faucett, Mo., 10 females; W. W. Brown, of Weston, Mo., 1 male and 2 females; A. F. Robinson, of Morrill, Kans., 2 males; Ed. Shuler, of Falls City, Neb., 1 male and 3 females; John McLair, of Horton, Kans., 1 male, a Scotch herd bull. This is Baron Mysie 176261, a 5-year-old bull bred by R. T. Scott of Pawnee City, Neb. Baron Mysie is sired by Velvetine Prince, out of Mysie 51st by Baron Wry, second dam Mysie 50th by Imp. Prince President. This is a straight Scotch bull and is without a doubt one of the leading bulls in this section of the country. Remember, this sale consists of the very choicest animals from these excellent herds and this being the first sale held by this association they are consigning some very attractive cattle and only those that will be of value to the buyer. This sale will be held under cover at Hiawatha, Kans., on April 19. Write at once to Everett Hayes, manager, Hiawatha, for a catalogue. Geo. P. Bellows, C. H. Marion and N. T. Moore will do the selling and bids can either be sent to them or to the manager. When writing mention this paper, and don't fail to attend this sale.

The Black and White Sale.

At Independence, Mo., on April 6, was held a sale of Poland-China swine by E. E. Axline, of Oak Grove, Mo., and of O. I. C. swine by Dr. O. L. Kerr, of Independence, Mo. Both of these herds

The H. R. Little Shorthorn Sale.

The Rustler, the herd bull to sell in H. R. Little's sale, is half brother to Ruberta, the great show and breeding cow at Tebo Lawn, having the same dam. The sire of the Rustler is also half brother to Ruberta, having the same sire, the great St. Valentine. The Rustler has a good show record, himself having won as a calf, 1st at the great show of the northwest at Hamline, Minn.

First at Kentucky State fair, 2d at Indiana State fair, 2d at Illinois State fair, 2d at Wisconsin State fair, 2d at the great Royal, Kansas City, 4th at the great International at Chicago. He was also shown with his great sister, Ruberta, in the produce class always standing close to the head of the list.

While his breeding is first-class and his show record is good, it is as a breeder that he has achieved his chief glory. Some of the best young stock on Tebo Lawn farm being by him, including a steer, that Mr. Andrew Pringle says is as good as he ever saw of the age.

The splendid work he has done in the Little herd will be demonstrated,

KENTUCKY JACKS AND STALLIONS.

Twenty-five choice registered black jacks, 15 to 16 hands high, 2 to 6 years old, to select from at our barns at Marion, Kans. The largest and best bunch ever shipped from Kentucky; also saddle stallions and a few jennets. J. F. Cook & Co., Marion, Kans.; Lexington, Ky.

are famous. No Poland-China breeder in the West would consider his herd perfect without some of the Axline kind in it, while Dr. Kerr with his O. I. C. pocketed most of the good prizes at the World's Fair that were given to that breed. Mr. Axline sold 30 head of Poland-Chinas, but his trade has been so good that he was obliged to sell some youngsters that he would much rather have kept longer. Excepting 5 head, his offering was all of summer and fall farrow. His average for the 30 head was \$54.40. The top of the sale was brought by the yearling sow, Lady Success, who went to Leon Calhoun, Potter, Kans., for \$400. Calhoun knows a good hog and if it suits him he buys it.

Dr. Kerr's offering was first-class in every respect and good judges pronounce it the best O. I. C. offering ever made in the West. His average on the 30 head was \$64.95. The top of the sale was bought by Kerr Salla, who went to G. G. Koenig, Lamars, Iowa, for \$310. A litter sister of Kerr Queen went to C. H. Brown, Tishomingo, I. T., for \$107.50. The sales were conducted by Col. Jas. W. Sparks, Marshall, Mo., who never did better work. It is pleasant to state that Dr. Kerr has a fine lot of youngsters coming on for future delivery. Some of the representative sales are given herewith.

such healthy condition, as those that arrived here yesterday. Every horse is well and many of them are ready to offer for sale at once. These horses came over in charge of our foreman, James B. McLaughlin remains in France where he will continue to buy all of the best horses raised in that country.

The H. R. Little Shorthorn Sale.

In Henry Little's sale April 26, will be bull and heifer calves that, if properly grown, will be winners in next fall's shows. If you are looking for something for the junior yearling class especially, remember this.

These calves are, of course, by The Rustler, who is one of the greatest herd bulls that will pass under an auctioneer's hammer this year, and then there are 24 good cows and heifers in calf to this great sire. All are of good breeding and the kind that Mr. Little expected to retain as a breeding herd until the sale of his farm and a dispersion of the herd was decided.

If you have not yet received a catalogue, send at once to Mr. Little for it mentioning THE KANSAS FARMER and be in attendance at the sale pavilion, Hope, Kansas, April 26, 1906.

The Big Missouri Shorthorn Sale.

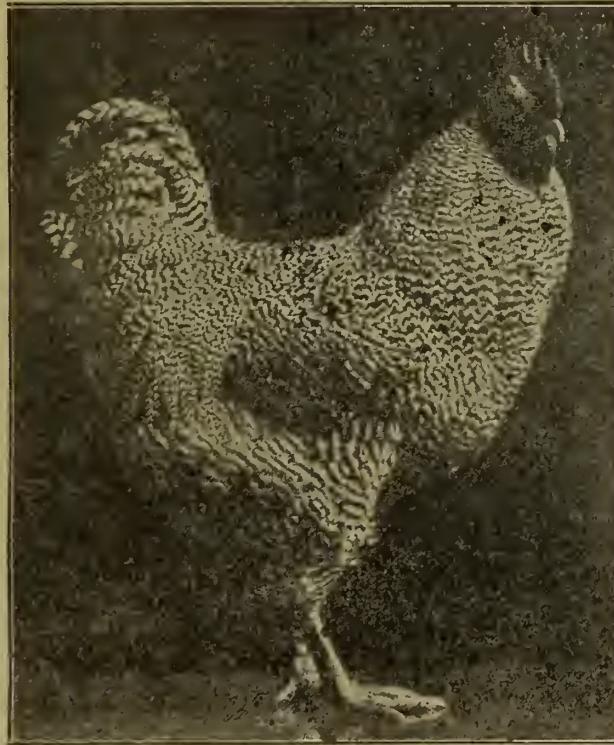

On Friday, April 20, at the new sale pavilion on the State Fair grounds at Sedalia, Mo., will be held a remarkable Shorthorn sale. It is not often that cattle from such noted herds are brought together in one sale. All the consignors are known far and wide for the quality of the Shorthorns they breed and most of them have a national reputation. These gentlemen are exhibitors in the prominent show-rings of

herds, and he intends to keep a class of cattle that is up to the standard. Mr. Wallace is one of the leading farmers and stockmen of Waterville and Washington County, Kansas.

Mr. Thomas's herd is headed by the great boars, Kansas Wonder and Nebraska Wonder, which are two of the greatest sires in the West. S. B. Steele, of Waterville, Kansas, has six Duroc under-boars for sale. They are fine ones and just right for summer service. If you need one write him.

Owing to the fact that the date claimed for the Shawnee Breeders' Association sale of Shorthorns conflicts with the date already claimed by H. R. Little, Hope, Kans., for his sale and the added fact that some of the consignors sold so short at private sale that it became impossible to secure enough animals to make a representative sale, the directors have decided not to sell April 26, the date claimed.

The Johnson County Breeders Association held their first cattle sale at Olathe April 6, and while prices ruled rather low, all the offering was sold and the members of the association have the assurance of the breeders in attendance that they are producing good ones, and that they should have been better appreciated. The Johnson County Breeders, who have banded themselves together for the advancement of the stock interest of the County, are on the right track and it is certain that in the future they will reap a harvest from the good seed scattered in this, their first sale effort. The purchasers all got animals at a price that could not help but prove profit-

The first-prize Plymouth Rock cockerel, St. Joseph, Mo., 1906; score 93½ points by Rhodes. One of the highest-scoring birds in the West. Owned by A. H. Miller, Bern, Kans.

the country, especially that of the American Royal where they get "inside the money." Sedalia is only about 3 hours from Kansas City on the Missouri Pacific. It is also on the main line of the M. K. & T. railroad. Get a catalogue and be there. It will be worth the time and trouble.

Col. T. E. Gordon.

The success of all public sales depends not only on the quality of the stock and a liberal amount of advertising but the ability of the auctioneer, as well. We thing desire to call attention to the card of Col. T. E. Gordon, of Waterville, Kansas, in this paper. Col. Gordon was recently elected president of the State Auctioneers Association. He is an able auctioneer, familiar with pedigrees and values of animals, and always enjoys the confidence of his audience. He is fast making a record as an auctioneer and can refer to the well-known breeders of Waterville as to his success and ability. You can make no mistake by employing him.

Plymouth-Chinas at the American Royal.

E. E. Axline, of Oak Grove, Mo., announces that the Berkshire, Duroc-Jersey and O. J. C. breeders have arranged a show of breeding stock in their several breeds at the American Royal next fall and desires that all Poland-China breeders write their wishes to him. As the other breeds will show in the breeding rings it seems desirable that the Poland-Chinas be represented also.

Gossip About Stock.

Albert Schroll, of Greenleaf, Kansas, is one of the coming Poland-China breeders of the State. Mr. Schroll's brood sows are of the large type with good backs and legs. He will have a fine crop of pigs for sale this fall.

Chester Thomas, of Waterville, Kansas, one of the well-known Duroc breeders is having excellent luck with his spring farrow. He now has over a hundred pigs and will be on the market next fall with some good ones. Mr. Thomas's brood sows are wonders in size and excellence of general make-up.

Thomas A. Wallace, of Waterville, Kansas, is one of the new members of the Hereford fraternity, having purchased thirty-three head at the closing out sale of Soltz Bros., of Barnes, Kansas. Mr. Wallace has purchased a bull from one of the leading Nebraska

able investments and these customers will be further purchasers when the advantage of the well-bred stock is demonstrated to them.

June K. King, of Marshall, Mo., is one of the prominent breeders represented in the April 20 Shorthorn sale to be held at Sedalia, Mo. Of his offering, Mr. King writes: "The four head that I consign are good useful cattle. The two cows are nearing their calving. One is in extra good flesh and a grand good one in any company. She is a Moss Rose. The Barrington is not so good nor in high condition but is a regular breeder of large, growthy calves. One of them in the sale—the Wild Eyes calf—is as well bred as any Wild Eyes living and is quite a fine calf. It comes of a very profitable and long-lived family."

Thomas and Swank, of Waterville, Kansas, formerly well-known as breeders of Duroc are closing out their red hogs and will then breed Poland-China exclusively. They have purchased their Poland China sows from the best breeders in the State and in their herd may be found sows from the stock farms of Dawley, Hammond, Prewitt, Wm. Martin, and others. These gentlemen are well known to the buyers of pure-bred stock and no mistake will be made when you buy them. They will have some fine offerings this fall with good backs and legs and fancy heads and ears and they have no superiors.

Manwaring Bros., owners of Ridge View herd of Berkshires at Lawrence, Kansas, writes that their hogs are doing well and their sales are good. S. McCullough, of Ottawa, Kansas, just purchased from Ridge View the fine young boar, British Duke 86585. This young boar has made a fine record as a breeder and is siring some mighty good pigs. He is a grandson of Berryton Duke and will probably equal him as a breeder. The Manwarings have sold out almost everything but expect to be able to put a fine bunch of youngsters on the breeding market that were sired by this boar. Only one yearling boar for sale now, but there will be a lot of hummers ready soon.

Chas. Morrison, owner of the Phillips County herds of Red Polled cattle and Poland-China swine at Phillipsburg, thinks he lives in one of the best sections of the country. In a recent letter he says they have been having plenty

How to Raise Young Chicks

The difficulties encountered in raising young chicks are numerous. Disease and lice are said to destroy nearly 50% of the annual poultry crop. Errors in diet and unsanitary conditions also help to decrease the poultry profit. But you do not need to suffer these losses if you will give poultry half the care you give other stock. Besides

DR. HESS POULTRY PAN-A-CE-A

is guaranteed to prevent and cure gapes, cholera, roup, indigestion, etc., allaying fermentation and destroying the germs of disease. By its special tonic properties it increases the powers of digestion and assimilation and compels the system to appropriate the maximum amount of food to egg production, also making the young grow fast, healthy and strong. Besides increasing growth and egg production Dr. Hess Poultry Pan-a-ce-a has special curative properties peculiar to itself. Take no so-called poultry food as a substitute. Remember that Dr. Hess Poultry Pan-a-ce-a is the prescription of Dr. Hess (M. D., D. V. S.) and bears the endorsement of leading poultry associations in the United States and Canada, and is sold on a written guarantee. It costs but a penny a day for about 30 fowls. Feed Poultry Pan-a-ce-a as directed, sprinkle Instant Louse Killer on the roosts, nests and into the dust bath, and we guarantee you will have no loss from disease.

INSTANT LOUSE KILLER KILLS LICE.

California

For a change why not make that visit to California early in the season? You'll enjoy it. Visit Grand Canyon enroute. Stop over and see the Petrified Forest. Ride through the country of fruits and flowers. Attractive and inexpensive variable route tours within the means of almost every one. About one-half the usual rate. Long limit and liberal stop-over privileges. I'll help you plan a trip. Tickets on sale April 25 to May 6, inclusive.

The Santa Fe is the line of fast trains, modern and comfortable chair cars and luxurious Pullmans, Harvey meals, rock-ballasted track, block signals.

N. B.—Members of the Mystic Shrine and delegates to National Congress of Mothers, both to be held in Los Angeles between May 7 and 11, should take advantage of this offer. Descriptive folder free.

T. L. KING, Agent, Topeka, Kansas

FOR SALE THE UNCLE SAM OIL-GAS BURNER
Asphalt Residuum for good roads and streets; crude oil for fuel, lubricating, or painting; gas, fuel-oil and water white kerosene of high-grade. All anti-trust independent products by barrel or carload.

W. F. RIGHTMIRE, - 216 The Drive, - Topeka, Kansas

of rain and the ground is full of water. Feed is plentiful and the alfalfa and wheat are showing up in great shape. Mr. Morrison has sold, during the past week, one fine Red Polled bull to J. C. Christensen, Randolph, Kans., also one to J. M. Walters, Lebanon, Neb., who also took home a fine boar to head his herd. Bred sows and gilts were also sold to F. A. Stark, Oxford, Neb., who took four hogs. L. J. Bowler, Lenora, Kans., took one; L. W. Beem, Smith Center, Kans., one; T. P. Gardner, Republic City, Neb., one, and George Woodman, Republican City, Neb. The demand for Red Polls was never better and Mr. Morrison has difficulty in raising enough to go around. He has a fine bunch of Poland-Chinas ready now. See his advertisement.

W. D. Calder, proprietor of the Square Deal herd of Poland-Chinas, Bancroft, Kansas, is one of our new advertisers. Mr. Calder is a young man

of exceptional ability in the raising of stock, and while he is not as long in the business as some others, he has succeeded in building up a good business in Northern Kansas.

He has some good herd animals and among his herd sows we found Expansion by Expansioness 26293, Black Beauty 73708 by Shawnee Chief, Calder's Pride 73707 by Black Chief, and many others of equally good breeding. His herd boar is an animal of excellent qualities. He is heavy boned, has a good head and neck, and a splendid back with well-sprung ribs, and is an animal of great breeding. He was sired by a son of Highland Chief 26354 and his dam is a granddaughter of Rival Perfection. With this good herd boar, Square Deal 36749, and the sows that he has Mr. Calder will have some fine pigs this fall. He now has two full sets old enough for service which he will sell right. See his ad in this issue.

The Santa Fe Good Roads Special.

(Continued from page 401.)
were the logs though it is better to mortise in the cross-pieces. They should be of pine or other light wood.

Of course many variations may be made from the description here given, but the purpose has been to show how to make a drag with the least expense and of the most effective pattern. The making of the drag is the hardest part of the whole problem of securing good roads without money. It will require the ordinary farmer perhaps two hours to complete the drag and have it ready for use with the ordinary tools at hand. A person who is handy with tools could make it in much less time and it will wear indefinitely when constructed according to the description given above.

With this drag better work can be done on the dirt roads than is possible with a \$250 grader. The grader itself requires the strength of at least one team to pull it on good roads when it is running empty. The grader will deposit a large mass of soft earth in the middle of the road just where it is not wanted and just where it will collect a large amount of moisture with each succeeding rain. The purpose of the split-log drag is to maintain the hardness of the surface under all conditions of weather.

In using the drag, start the team so that the wheel-track will be between the horses, and drive down the right-hand side of the road leading towards town. When you have reached the end of the section of road you desire to cover turn, and with one horse on each side of the wheel-track, come back over the left-hand side of the road. The dragging must not be done when the ground is too wet and will do comparatively little good if the ground is too dry. The proper time to drag is after each rain or spell of wet weather when the earth gets dry enough so that it will not stick to the drag. If it is desired to widen the road it is best to plow a very light furrow on the mark left by the right-hand end of the drag as it has passed to and fro and then, with the drag spread the loose earth over the surface of the road so that the passing teams may pack it hard. This can be continued indefinitely until the road has reached the desired width.

Many farmers think it is necessary to precede the use of the drag with the road-grader. This is not necessary at all and should not be done under ordinary circumstances as the drag will make the most perfect road without the assistance of any other tool or implement. Many farmers seem to think it necessary to construct their drags so as to move large quantities of earth toward the middle of the road. This is all wrong and just what the drag is not built for. Many farmers also think they should shoe the front faces of both the logs in the drag with iron or should at least shoe the entire surface of the front log. Again this is all wrong. The placing of shoes on both the logs or across the entire length of the front log defeats one of the purposes for which the drag is built, namely, the spreading of a thin layer of earth toward the middle of the road with each dragging and smoothing the surface.

A short experience will teach the operator how to handle a drag to the best advantage. He will learn that he should have a slow-walking, steady team, as a fast team will carry the drag along so rapidly that the collected earth in front of the drag does not have time to fall into and fill the ruts and holes. He will find that by changing his position on the platform he can make of the drag a cutting instrument or a smoothing instrument. He should use the drag at a time when the soil is wet enough to bake in the sun after it has been dragged. The method used by Mr. King is one which makes a good road of successive thin layers of earth, each of which is packed solid by the traffic and retains the solidity of the surface all the year around.

It is less labor to maintain a half mile of dirt road in good condition the year around than it is to water a team of horses for the same length of time. A trial will prove this.

NOTES.

There are many sod roads in Kansas and their proper handling presents a problem that has not heretofore been easily solved. Mr. King's recommendation is that, for the purpose of handling sod roads or those which have a strip of sod in the middle, a time should be selected when the ground is thoroughly soaked with water. A disk-harrow should be set at a sharp angle and run over this strip of wet sod to cut it into ribbons. Then with the use

of the King drag these ribbons may be broken up and distributed over the surface of the road in such a manner as to lay the foundation for a good road in the future.

One advantage possessed by the King drag and its use at the proper time, is that it will kill the weeds along the road. Nothing is so destructive to a good road as the heaving action of growing weeds, and if the drag is used at the proper time, when the roads are wet but not sticky, not only will the small weeds be destroyed but a new surface on the road will be created that will not permit the seeds to germinate.

Statistics, published by the United States Department of Agriculture at Washington, show that the average dirt road in ordinary condition produces so much draft on a team that it costs the farmer 25 cents per ton per mile to haul his produce to market. These figures are based upon average conditions and with an average haul of three miles. In France where the roads are good, the cost is less than 8 cents per ton per mile.

Most people, when they see a macadam road, think that the macadam constitutes the road. This is all wrong. The road should be built before the macadam is placed upon it. The stone is simply used to prevent wear just as the tire on a wagon-wheel is used to protect the wheel. It is the wheel and not the tire that supports the load. It is the road and not the macadam that supports the traffic.

The split-log drag should be used after each rain or spell of wet weather and when so used it serves to add a new and thin layer of earth to the road that may be packed solid by the traffic before the addition of another such layer. Dirt roads should be made in the same manner as a house is painted, one coat at a time.

Ordinarily it is never necessary to use the road-grader before the split-log drag, or at any other time. Of course there are exceptional cases where the grader is useful. But as Mr. King says: "The split-log drag needs no John the Baptist."

The idea that road-improvement means brick-paving or macadam and consequent high taxation has been thoroughly disproved by the experiences of the party on the Santa Fe Good Roads Train and by thousands of others. But even if it were possible to build all of the macadam roads that now seem desirable, there would still remain a very large percentage of dirt roads. A farmer who came from Ohio recently said that he could not remember ever having seen a dirt road until he came West, and yet statistics show that in his country there are more than 90 per cent of dirt roads. The problem of how to handle the large mileage of dirt roads, then, is a very important one, and is thoroughly and easily solved by using the split-log drag.

In the pamphlet distributed by the Santa Fe Railroad on the Good Roads Train occurs a statement that is incorrect and likely to cause trouble. The statement is this: "First make the drag and have a four-horse team ready for use. Wait until your roads are very soft, the wetter and softer the better." Mr. King states that there is but one time when a King drag can be used under such conditions, and this is for the purpose of filling up water-holes that exist in the road and occurs but once in the history of any dragged road.

On the principle that it is easier to make a water-tight roof than a water-tight tank, Mr. King urges the use of the drag one time when first beginning its use and when the road is very sloppy and wet. By moving a mass of thin mud into these puddled water-holes they are filled with a material which assumes a brick-like hardness when it dries and serves to turn the water hole wrong side up so that the outside of the bottom may be used for the road instead of the inside.

In nearly all country roads it is necessary for the driver to go slowly when approaching a bridge or culvert because of the "chuck-holes" on either side. After the King drag has been used a short time these chuck-holes cease to exist, and the speed of the team need not be slackened in passing a bridge or culvert.

Most of the stops made by the Good Roads Train were at county-seat towns. Whenever this occurred Prof. W. C. Hood, of the State University, who was one of the lecturers on the train, collected figures from the county clerks showing the amount of expense now incurred for the maintenance of county roads in each county, exclusive of culverts and bridges. This amount was found to range from \$40 to \$50 per mile per year. This heavy expense is incurred by the officials under the

present system of road-making in building roads which they do not want and can not use, when by use of the King drag they could have good dirt roads at an average expense of \$5.00 per mile per year or less.

The split-log drag is not a good ditching machine. While it will give a good contour to the road itself it is generally desirable to have a ditch at either side to carry off the surplus water. This can be made easily and cheaply by building a ditcher in the shape of a letter A or an old-fashioned barrow, and placing a steel shoe on the front of the left-hand arm. The right-hand arm serves to guide the machine in the ditch and the left hand one does the cutting.

More mistakes are made by those who build King drags in placing the logs too close together than in any other way. The logs in the King drag should be not less than 30 inches apart and it would not be harmful to have them farther apart. They must never be closer.

Build a King drag now and talk about it afterwards. Get rid of the idea that you have built it for the purpose of moving large quantities of earth to the middle of the road. That is not the object, although it will be found that the middle of the road gets gradually higher with the constant use of the drag, and ultimately it will become necessary to reduce the crown by dragging dirt away from the middle instead of toward it—about once in three draggings.

Don't drag the road when it is too dry. This simply makes more dust and wears out your drag and your temper. It is better to drag often in the winter and spring and less frequently in the hot, dry months of the summer and fall. Mr. King states that he kept the road in front of his place like a race-track during most of the year and only dragged it twelve times. Two of these draggings occurred in February and none in August.

Do not let the children ride on the drag. It is not a plaything nor is it a sled. It may be dangerous for the children to ride upon it and it would certainly interfere with its proper work.

If the dirt roads of the country are properly dragged, a demand will come in time for macadam or gravel roads between important towns.

Mr. D. Ward King, of Maitland, Mo., who has made the split-log drag famous, lays no claim to being its inventor nor does he have it patented. He states that the inventor of the split-log drag died some 300 years ago and the only merit Mr. King claims in connection with it is its introduction to the general public. To this he is certainly entitled and should receive the thanks of all as a public benefactor. The split-log drag is not for sale but is free to everybody. All that is desired is to see everybody use it.

If your work is of such a nature that you can not drag your road on proper occasions at all seasons of the year, it is better to chip in a few cents with your neighbors and employ some one who will make it his business to drag the road at the proper time. Such a person can be employed in most neighborhoods at from 25c to 35c an hour for time actually spent. This is the Kansas Club Idea sanctioned by the Kansas Good Roads Association at its last annual meeting.

During the trip in the gas belt the party on the Good Roads train were permitted to see a number of interesting and unusual sights to be found nowhere else in Kansas outside of this wonderful region. At Coffeyville the party was permitted to visit a very large pottery and witness the operations of making jugs, milk crocks, etc., which are burned by natural gas. At Erie the party was conducted through an oil refinery and shown the wonderful processes through which the crude black petroleum passes in the process of the manufacture of naphtha, gasoline, kerosene, watch oil, machine oil, fuel oil, paving residue, tar, and coke. At Independence all of the operations necessary in the manufacture of window glass were seen and these were marvelous to most of us. At Cherryvale the train passed close by a plant of the great Uncle Sam Oil refinery though time did not permit us to visit it. At Iola the party was accorded the unusual privilege of an inspection of all of the departments of one of the greatest smelters in the United States. There are some 400 men employed here in the process of changing the coarse-grained, yellowish-looking rocks into the silvery zinc ingots.

Because of the lateness of the season, which kept the farmers at home, but more perhaps because of the heavy down pour of rain on Saturday, the crowd in attendance at the Topeka

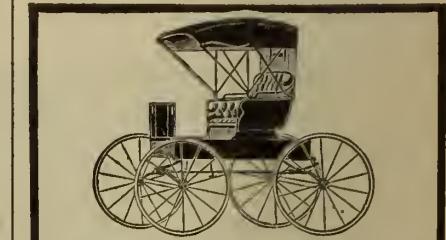

ROOF PROTECTION
Any building that is worthy of a roof is worthy of a good one; one that will protect the contents from rain, wind or snow. Any roofing material that requires patching every little while is liable to cause you more damage than a new roof of

Mica-Noid
READY ROOFING

And besides, consider the annoyance. We don't claim that Mica-Noid will last forever, but years of test in all kinds of climates have proven it will outlast tin, shingles, or iron many times. Then there is another feature of interest about Mica-Noid. You put it on yourself thereby saving one-half the expense. Wouldn't Mica-Noid make a splendid investment for any of your roofs?

To enable you to examine this roofing, we will send you a sample of each thickness, FREE. All we ask is your name.

meeting was not as large as had been expected. What it lacked in size, however, was made up in enthusiasm. This meeting was presided over by Secretary F. D. Coburn of the Kansas State Board of Agriculture.

Miscellany

Students' Opinions of the Y. M. C. A.

At the beginning of the building movement in the Agricultural College, requests were sent out to several leading students for a short statement of their opinion concerning the work of the Y. M. C. A. The following are some of the replies:

"The Y. M. C. A. means more to me than any other organization in college. Through its work I have learned to develop the spiritual side of my life, which changes the view of a life-work from one of selfishness to one of service."—J. C. Cunningham, President Athletic Association.

"The Y. M. C. A. is the most important student organization on the campus, touching as it does the moral and religious phases of student life. The progressive steps taken in the last few years have placed it far to the front in value as a college auxiliary. Its best recommendation is the really effective, far-reaching work it is doing."—A. N. H. Beeman, Editor-in-Chief of Student's Herald.

"The Y. M. C. A. has been one of the greatest factors in my development while in college. It has given me something to do in Christian work and kept me out of mischief in idle moments, besides throwing me in the company of the best young men in school. It is indispensable in our colleges."—W. B. Banning, President Webster Society.

"I consider the Y. M. C. A. to be one of the greatest factors in a college man's life. It stands for pure, clean, active manhood and a strenuous life. Its members are the leaders in all student enterprises, such as the college papers, literary societies, and athletics. Its new student work is of inestimable value. It furnishes a social and spiritual development that the churches are unable to give and merits the most hearty cooperation of students and alumni in every detail of its work."—N. L. Towne, '04, Captain '02-'03 Football Team.

"Among college organizations the Y. M. C. A. stands without a peer. The other organizations, even the best, though they develop many cardinal virtues, leave untouched that part of man's nature which he himself is prone to neglect—his innate religious propensities. To me the Y. M. C. A., with its rapid growth, wide-spread influence, and magnificent outlook, presents strong attractions and unlimited opportunities for the development of all that is desirable, especially that princely quality, helpfulness to others. I am glad to be a member in so royal an organization." Geo. Gassner, Editor of The Jayhawker.

"When I arrived in Manhattan last fall, a perfect stranger, I was agreeably surprised to meet with a company of young men who seemed anxious to make me feel at home and to give me all the help and information possible. They were the Y. M. C. A. boys, who were working, not for personal gain, but from a feeling of good-fellowship and true brotherly kindness. I have found their association and friendship most helpful."—H. A. Ireland, Winner College Stock-Judging Contest.

"From observations in the last four years I believe that the good of the Y. M. C. A. is beyond estimation. Its influences for that which is pure and manly are found in all organizations of the college. I believe that no better investment for the college can be made than for the support of the Y. M. C. A."—Nicholas Schmitz, Business Manager of Students' Herald.

"The Y. M. C. A. holds a recognized place in college work and is worthy of good support. I believe that the erection of a permanent building will be of great value to the college."—H. P. Hess, Captain of Baseball Team.

"For the college the Y. M. C. A. means a better and more industrious class of students, a higher standard of scholarship, less rowdiness, and cleaner athletics. For the student it means a help toward a cleaner and purer life and a guide for him who is trying to follow where the Master leads."—Earl Evans, Manager Basketball Team, Member Belmont Quartet.

"The Y. M. C. A. has been to me a training school in the art of systematizing. Not only that it has been the home-like organization in college. I know it has influence and that it has been effectively used. In my four years of school I can see its effects both on athletics and in the literary

societies."—J. J. Biddle, President Hamilton Society.

"There is probably no student institution in any college more influential among the student body than the college Y. M. C. A. An organization that has for its object the harmonic training of mind and body that they may work in sympathy with the spirit can hold no other place. The Y. M. C. A. takes a student as he enters and by the end of his course it has helped him into the broader view of morals, science, athletics, and enterprise."—Tom L. Pittman, Manager Cooperative Bookstore, Captain Company "A."

"What the Y. M. C. A. has meant to me: (1) The privilege of Christian fellowship and association. (2) A closer spiritual relation to God. (3) A fuller appreciation of the love of Jesus Christ for men, and the responsibility and necessity of living a Christian life. I feel that the development I received in the Y. M. C. A. will prove to be a valuable part of my education when I am confronted with the future problems of life."—Howard D. Matthews, President Alpha Beta Society in Winter Term.

"The College Y. M. C. A. has meant a great deal to me. The benefit derived from its Bible study classes, the training received upon its committees, the acquaintance with its membership fostered by its social gatherings and atmosphere of help and goodwill, the good received from its religious meetings and high standards of Christian living, have all been of incalculable value to me and will help me in future life."—T. W. Buell, One of the Inter-Society Orators.

"Although not a member of the Y. M. C. A., yet I consider the organization one of vast importance and one which deserves to be fostered in this institution, perhaps, more than in some others, for two reasons: (1) Because of the large number of young men who work their way through college and often need its assistance; (2) on account of the large number of young men here. The work of this organization not only has its influence within the college halls, but also among the many homes represented here."—Carl Elling, President Senior Class, Second Place Winner in the International Stock-Judging Contest at Chicago.

"The Y. M. C. A., as we know it today, is one of the greatest spiritual factors in student life. Its object is the work of implanting in the lives of the boys a noble, clean, Christian character, which alone determines the true man. To allow this great work to grow, it is necessary that its accommodations be enlarged. To do this, and not interfere with the college, a building separate from the college and near the college campus should be permitted them, that they may keep in constant touch with the students."—T. E. Dial, Cadet Major.

Farmer's Elevator Companies.

Over seventy delegates, representing nearly 160 farmers' elevators of Kansas, Nebraska, and Oklahoma, met at Hutchinson April 3, for the annual meeting of the Farmers' Independent Grain Dealers of Kansas. This organization was formed a year ago, and is an association of farmers' independent organizations engaged in handling grain. It is in no sense a merger, no company holding any stock or interest in any other company. The meeting was called to order by C. W. Peckham, of Haven, the vice president, in the absence of President W. M. Kenton, of Chase. E. M. Black, of Preston, was secretary.

President Roosevelt was endorsed and the Kansas board of railroad commissioners condemned for alleged inactivity in behalf of shippers of the State. A strong anti-pass resolution was also adopted.

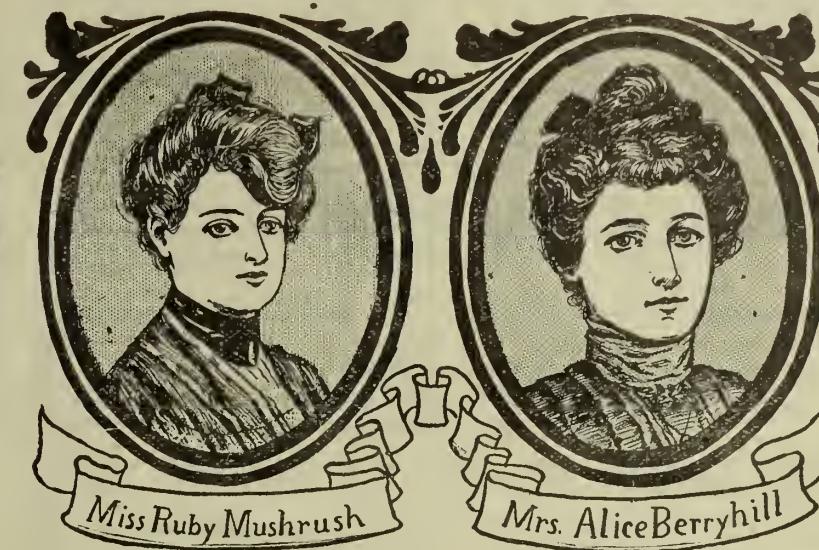

The by-laws of the organization were so changed that independent elevators of Nebraska and Oklahoma were admitted to membership in the Kansas organization and the officers have assurances that within sixty days the membership will be more than doubled, embracing practically all the independent elevators of the two States and the territory.

The farmers' elevators of Nebraska last year handled 17 million bushels of grain, the Kansas independent elevators handled 12 million bushels, and the Oklahoma independent elevators, approximately, 3½ million bushels. The elevators represented at the meeting have about 1 million dollars capital.

Arrangements are being made for the marketing of grain by a mutual company at Kansas City. Resolutions were adopted denouncing the Kansas City board of trade for suppressing information regarding markets, and for arbitrarily deducting 100 pounds from each earload of grain handled by its members; also favoring the consignment of grain to the National Board of Trade of Kansas City.

Women in Our Hospitals

Appalling Increases in the Number of Operations Performed Each Year—How Women May Avoid Them.

Going through the hospitals in our large cities one is surprised to find such a large proportion of the patients lying on those snow-white beds women and girls, who are either awaiting or recovering from serious operations.

Why should this be the case? Simply because they have neglected themselves. Female troubles are certainly on the increase among the women of this country—they creep upon them unawares, but every one of those patients in the hospital beds had plenty of warning in that bearing-down feeling, pain at left or right of the abdomen, nervous exhaustion, pain in the small of the back, dizziness, flatulence, displacements of the organs or irregularities. All of these symptoms are indications of an unhealthy condition of the female organs, and if not heeded the penalty has to be paid by a dangerous operation. When these symptoms manifest themselves, do not drag along until you are obliged to go to the hospital and submit to an operation—but remember that Lydia E. Pinkham's Vegetable Compound has saved thousands of women from surgical operations.

When women are troubled with irregular, suppressed or painful periods, weakness, displacement or ulceration of the organs, that bearing-down feeling, inflammation, backache, bloating (or flatulence), general debility, indigestion, and nervous prostration, or are beset with such symptoms as dizziness, lassitude, excitability, irritability, nervousness, sleeplessness, melancholy, "all-gone" and "want-to-be-left-alone" feelings, they should remember there is one tried and true remedy.

Lydia E. Pinkham's Vegetable Compound Succeeds Where Others Fail.

The following letters cannot fail to bring hope to despairing women.

Miss Ruby Mushrush, of East Chicago, Ind., writes:

Dear Mrs. Pinkham:—

"I have been a great sufferer with irregular periods and female trouble, and about three months ago the doctor, after using the X-Ray on me, said I had an abscess and would have to have an operation. My mother wanted me to try Lydia E. Pinkham's Vegetable Compound as a last resort, and it not only saved me from an operation but made me entirely well."

Mrs. Alice Berryhill, of 313 Boyce Street, Chattanooga, Tenn., writes:

Dear Mrs. Pinkham:—

"Three years ago life looked dark to me. I had ulceration and inflammation of the female organs and was in a serious condition.

"My health was completely broken down and the doctor told me that if I was not operated upon I would die within six months. I told him I would have no operation but would try Lydia E. Pinkham's Vegetable Compound. He tried to influence me against it but I sent for the medicine that same day and began to use it faithfully. Within five days I felt relief but was not entirely cured until I used it for some time.

"Your medicine is certainly fine. I have induced several friends and neighbors to take it and I know more than a dozen who had female troubles and who to-day are as well and strong as I am from using your Vegetable Compound."

Lydia E. Pinkham's Vegetable Compound at once removes such troubles. Refuse to buy any other medicine, for you need the best.

Mrs. Pinkham, daughter-in-law of Lydia E. Pinkham, invites all sick women to write her for advice. Her advice and medicine have restored thousands to health. Address, Lynn, Mass.

A CONCRETE SILEO
Gedney Farms, White Plains, N. Y.

Portland Cement Concrete has become the recognized building material where strength, durability and sanitary conditions are demanded. Our new book "Concrete Construction About the Home and on the Farm," has just been received from the printers. It contains photographs, descriptions, specifications and sectional drawings for many of the smaller structures that can be built without the aid of skilled labor by the suburbanite or farmer; also much general information and many valuable hints to small contractors.

A copy of this book will be sent free upon request.

Contentment.

"Brown and yellow and yellow and brown
Are choicest colors for my crown,"
The sunflower said; "I am content;
I wish no other ornament."

"Yellow and white," the daisy spoke,
"We're made, I think, for my own sake;
I scarce would want to show my face;
If other tints should take their place."

"Blue as heaven draped on high,
Blue as bluest spot of sky,
It is the shade I love the best,"
The violet cried with hearty zest.

—J. E. Everett.

Our World.

Our world the truest is the world of mind;
A loving world if all our thought are kind;
A holy world if what we think is holy;
A world of truth if truth is sought for solely.

I may, though, on this globe of soil, assert
I live not in a sticky world of dirt;
But one of thought and choice, desire
And will And hopes that throb and loves that thrill.

—J. E. Everett.

Easter Thoughts.

Easter, like Christmas, is a Christian celebration. It reminds us that Christ rose from the grave, proving to humanity the victory over death, and that life is just begun here on earth. It should indeed be hailed with joy and thanksgiving, and be made a day of rejoicing. When Christ rose from the dead, he said by the act, "I am the resurrection and the life." But that is not all. He is speaking through nature, his handiwork, and saying, "I am the resurrection and the life." Life is springing up everywhere. What so lately was brown and dry in tree and shrub is now showing life and verdure. The life-giving sap is coursing along under the bark, and soon the whole earth will be full of life and beauty. The seeds that have lain in the ground all winter will soon send forth leaves and blossoms, thus proclaiming victory over death.

To all who have had to bid farewell to loved ones and see them lain beneath the sod, the Eastertide is saying, "I am the resurrection and the life." Your loved ones are not there; what is there contains only the elements of the earth, and back to earth it will go. Christ ascended. Think of them as with him above.

The custom of sending flowers on Easter day is a pretty one, especially if sent to the shut-in or the lately bereaved and lonely. The giving of flowers speaks more than words. They need not be expensive hot-house flowers—indeed, the ones cared for in the home and cared for with loving hands are prized more than those that cost money. Bulbs of hyacinths, daffodils, jonquils, lilies of the valley, and others, if planted six or eight weeks before Easter, will be in bloom and make beautiful Easter gifts at a very little expense. Lovers and sweethearts exchange flowers at Easter, but why do not the husband and wife? They need the cheer and reminder that love is still in the heart even more than the young lovers. Why let love be buried beneath the rubbish of care and the common things of life?

Children enjoy the bright-colored Easter eggs and the custom of hiding and hunting them is great fun. The children of Washington enjoy a treat that every child is not permitted to do—I refer to the Easter egg-rolling at the White House. Girls and boys gather at the grounds Monday morning after Easter and enjoy rolling their eggs down the hill. This affair is witnessed by many spectators, including Senators and statesmen and often by the President.

The giving of Easter gifts is becoming more and more a custom. The gifts take the form of Easter symbols, such as eggs filled with confectionary, rabbits, or lilies.

Our Topeka Continental Sunday.

Under the above heading the Topeka Capital of December 5, 1905, said in part:

"Topeka in late years is becoming so liberal, that it leans backward. . . . Restrictions even of the most remote and incidental character upon the inclinations and whims of the people are cut of fashion, and the solid religious ideas that created in the country a series of generations of men and women whose opinions were convictions, who lived for something more than

pleasure and excitement and money-madness, have lost their authority."

It then went on to speak of the mischievous effect on the fibre of a nation when its Sabbaths are desecrated by the opening of the Sunday theater, to which might be added the ball games and open saloons and gambling dens, to say nothing of the Sunday excursions made specially enticing and "cheap" by the various railroad companies.

What is done in Topeka is done in greater or less degree in many other towns in Kansas, and the Sabbath desecration is not confined even to Kansas, but is wide-spread over the United States. It is the knowledge of these lamentable facts that has led such well-known persons as Wilbur F. Crafts, William Hubbell, Mary James, and others to plan a week from April 22 to April 29 inclusive, in which to give a prominent place to the various phases of the Sabbath question in the press, in the pulpit, in the Sabbath School, and other meetings held during that time. Can not every one who reads this article undertake to interest some minister and Sabbath school in putting forth some effort to influence the next Legislature to make the Sunday theater and ball games illegal?

Likewise can not every father and mother who reads this take pains to instill into the minds of their children that the Sabbath is a day holy unto the Lord? That Sunday excursions of all kinds, Sunday visiting, Sunday buying, unnecessary Sunday work, as well as neglect of the religious aspect of the Sabbath, are not conducive to the highest development or in keeping with the express commands of God, with their accompanying blessings as given in Isaiah 58:15, 14?

Free literature on this most important question can be obtained from the Woman's National Sabbath Alliance, 156 Fifth Avenue, New York.

ENGLISHWOMAN.

The Lord's Day Week.

The undersigned, in behalf of the societies we represent, appeal to all lovers of Christ in America to set apart April 22 to 29, inclusive, as Lord's Day Week, devoting as much of it as practicable, at home and in the regular church services, to thanksgiving, prayer, study, and service with reference to Sabbath defence.

Praise God, as ever, for the day of rest from toil, and also, in joyous communion with and love and service of our blessed Saviour, for a year that has brought some victories in the arduous warfare for the imperilled Sabbath. We note three among many.

(1) God has moved some of our governors, mayors, and district attorneys to make Sunday law supreme, especially over the saloon. Never before since the civil war have so many saloons been closed on Sundays, and never since then have so many pontifical papers and business men approved of such closing.

(2) He has led some railway managers to refuse to run Sunday excursion trains.

(3) He has brought together the various societies that seek to exalt the Lord's Day in hearty cooperation.

Pray God to arouse His people to press on vigorously for greater victories and to awaken employers and employees to realize the folly and curse of Sunday toll, and the moral blight of Sunday sport.

Study God's Sabbath Law as written in the Bible, in nature, and in history, all of which teach that Christian life and growth are impossible unless God has fullest opportunity on His day, to possess, cleanse, and beautify our whole being—lest the Sunday paper, or social function shall rob us of the soul's best inheritance. Study, also, in criminology and history the effect of Sunday sports that weaken the character of men and nations. Study habits and surroundings as related to Sabbath keeping, and how to make the Sabbath more richly bless personal life and the life of the church and community. And let all appeal to Congress to forbid Sunday work in the Money Order and Registry departments of the post-offices and in the National Capital. Let us also urge, regularly or frequently, State and National Legislatures to secure to all employees, who work on Sunday on the plea of necessity or mercy, fifty-two weekly rest days in each year as is done in Switzerland. Let us secure for the Sabbath in this annual week of prayer, a prominent

place in the press, and in the pulpit, the prayer-meeting, the Sabbath School and in the W. C. T. U., and the other reform meetings of that week and also during all other weeks of the year. Let us federate reform forces in each town so as to educate all the people as to the value of the Sabbath, by putting Sabbath literature into every house and by encouraging and assisting executive officers to enforce obedience to Sunday laws.

ROYAL

BAKING-POWDER

Absolutely Pure

A GRAPE CREAM OF TARTAR BAKING POWDER

It makes the most delicious and healthful hot breads, biscuit and cake

FREE FROM ALUM, LIME OR PHOSPHATIC ACID

Alum baking powders are unhealthful. Do not use them for raising food under any circumstances. So detrimental are alum baking powders considered, that in most foreign countries their sale is prohibited. In many States in this country the law compels alum powders to be branded to show that they contain this dangerous acid, while in the District of Columbia, Congress has prohibited the sale of all food that contains alum.

Alum baking powders are sold to consumers at from 10 cents a pound to 25 ounces for 25 cents, or 25 cents a pound, and when not branded may generally be distinguished by their price.

place in the press, and in the pulpit, the prayer-meeting, the Sabbath School and in the W. C. T. U., and the other reform meetings of that week and also during all other weeks of the year. Let us federate reform forces in each town so as to educate all the people as to the value of the Sabbath, by putting Sabbath literature into every house and by encouraging and assisting executive officers to enforce obedience to Sunday laws.

Rev. J. B. Davison, secretary Wisconsin Sunday Rest Day Association; Rev. S. T. Mutchler, M. D., secretary Pennsylvania Sabbath Association; Rev. M. D. Kneeland, D. D., secretary New England Sabbath Protective League; Rev. W. F. Crafts, Ph. D., superintendent International Bureau of Reforms; Rev. J. G. Shearer, A. B., secretary Lord's Day Alliance of Canada; Rev. Alex Jackson, Ph. D., secretary the Cleveland Sunday Union; Rev. Edward Thomas, D. D., L. L. D., manager Sunday League of America; Rev. Frederick J. Stanley, D. D., secretary American Sabbath Union; Rev. Wm. S. Hubbell, D. D., secretary New York Sabbath Committee; Mrs. Mary D. James, honorary president of the National Woman's Sabbath Alliance; Mrs. Varila F. Cox, superintendent Sabbath Observance Department of the National Woman's Christian Temperance Union.

Proper Food and Feeding.

The amount of advice we have had concerning what to eat and what not to eat, would fill a book. If we eat bolted flour we may expect dyspepsia; if we eat meat look out for lithemia; in pork trichiniasis may be in hiding, and in richest milk the feverish bacilli is doubtless sporting.

And there is much in what we eat, much that concerns our health and strength, but there is much in the way we eat it. It is well to look out for germs, but the most virulent can not stand a bath in good, healthy gastric juice. It is necessary that germs come, one way or another, but let it be woe unto them when they strike the gastric membrane.

Children nowadays are trained to do most everything that is useless and expensive, let us train them to chew, to eat and drink slowly.

A glass of milk swallowed at a gulp is to revert to the way of the ostrich, and to invite indigestion and feed bac-

teria, but to sip it slowly and leisurely is to make the warm, rich blood and the strong, throbbing heart.

Slow eaters are small eaters, because hunger is appeased physiologically through the nervous system. Lots of people never eat, properly speaking, they simply fill up. The delicate nerves of the stomach, which would tell us of hunger appeased, are overwhelmed and stunned by the deluge of drink and the rain of half-masticated food. So they lie silent, and the nerves of ordinary sensation give the signal when we begin to crowd our diaphragm up about the collar bone, and we stop, not because we have enough, but because we are loaded and another mouthful might explode us.

It has been shown experimentally that it is very hard to infect a healthy animal by way of the alimentary tract, though it be fed upon the most virulent of the pathogenic germs.

It is next to impossible to avoid drinking at some time or other the typhoid bacilli, but we can do much towards improving the condition of the digestive organs.

How many of us take a glass of water in one stream, and yet even a horse takes time to drink.

Proper eating and drinking will go far towards rendering harmless many of the bacteria that threaten our life on every side.

There is something in what we eat and drink, but there is a great deal in the way we eat and drink it.—Health.

The Foot-Path to Peace.

To be glad of life because it gives you the chance to love and to work and play and to look up at the stars. To be satisfied with your possessions, but not contented with yourself until you have made the best of them. To despise nothing in the world except falsehood and meanness, and to fear nothing except cowardice. To be governed by your admirations rather than by your disgusts; to covet nothing that is your neighbor's except his kindness of heart and gentleness of manners. To think seldom of your enemies, often of your friends, and every day of Christ; and to spend as much time as you can, with body and with spirit, in God's out-of-doors. These are little guide-posts on the foot-path to peace.—Henry Van Dyke.

The Young Folks

Plant the Trees, Children.

BY REV. DR. C. S. PERCIVAL.

[This song is printed by request that school children may learn it for Arbor day.]

Air: Ring the Bell, Watchman.
Round the green play-ground the dear
children stand,
Joy in their faces and shovel in hand,
Waiting a word to be borne on the
breeze—
Ready for the welcome mandate,
"Plant, plant the trees."

CHORUS.

Plant the trees, children, plant, yes
plant.
Plant for a joy that the future will
grant.
Good Kansas sends forth her word on
the breeze—
Joyfully obey the summons: "Plant,
plant, the trees."

When you are old you may bask in the
shade
Which by the growth of this planting
is made.
Your children's children, so Heaven
decrees,
Will rejoice you heard the summons,
"Plant, plant the trees."

CHORUS.

Plant trees of knowledge where ignor-
ance reigns;
Plant trees of virtue on sin's arid
plains;
Make of yourselves "trees of Right-
eousness;"—these
Plantings fill the world with beauty:
"Plant, plant the trees."

CHORUS.

When having passed to the happier
land.
Fast by the "Tree of Life" joyful you
stand,
Gladly you'll learn how the Saviour
decrees
Earthly planting blooms in glory:
"Plant, plant the trees."

Fleetfoot; The Autobiography of a Pony.

CHAPTER III.—HOMeward Bound.

It must have been quite late in the afternoon when Jake (his nap completed) was prompted to rise. He got up slowly and shook himself, then gazed listlessly at the herd of cows approaching from the distance, their bells tinkling clearly in the still air. Finally his glance lit on me; at first he looked a little surprised but the next moment seemed to remember the situation perfectly. Not far away was a spring from which issued cool, sparkling water; going to this my friend quenched his thirst, mutely suggesting that I should do the same.

Owing to the smallness of my stature the spring was not a handy place for me to drink, and I had almost to stand on my head in order to reach it. While in this uncomfortable position I was startled by the hurrying clatter of many hoofs, and almost at the cost of my life I placed my feet on solid earth again. Just then a loud squeal came from somewhere not far from me and I was surprised to see Big Jake balancing himself on his front hoofs while his hind legs sawed the air in a most energetic manner. Realizing, as I did, what an effort those acrobatic exercises must be on my companion, I could not help feeling that something unusual had called them forth.

My doubts and fears were soon settled, however, for the sounds of the hoof-beats ended almost as soon as Jake's squeals began, and the sight of a troupe of snorting horses a short distance off, anxious yet fearful to approach nearer, told me that it had been Big Jake's sole intention to keep his former associates at bay. I instinctively understood that it was more for my safety than for any other reason that Jake had declared war against his former friends, and I in a vague way was thankful for his interference.

After more loud squeals accompanied by vigorous kicks the group of horses were forced to depart whence they came, and as they disappeared from view, Jake gave me a self-satisfied look from under his long hair, and then calmly proceeded to crop the tender grass.

No other interruption coming our way, my valiant friend started on a slow canter across the pasture and I trotted closely behind.

Presently we came to a high wire-fence in the middle of which was a wooden gate, the fence separating the pasture from the road. The latter was still wet from the recent rains and unsightly ruts were made by the passage of heavy vehicles, but on either side the grass grew fresh and green and flowers of many hues smiled and nodded in the evening breeze.

We halted at the broad well-built gate at a loss to know what next to do. I, at least, was puzzled and had I been alone would never have even considered getting out on the road, but Big

Jake seemed equal to the solving of all problems, for just as soon as he assured himself that the lock was firmly fastened, a new plan at once came into his wise old head.

He turned round slowly, then backed with his whole strength against the gate near the hinges, and gradually the heavy piece of timber lifted and parted, allowing us to pass from the pasture onto the highway. Jake, pleased with his skillful management, started off briskly seeming to well know where he was bound for, and I almost kept up with him, although I was by this time both hungry and tired.

It seemed to me quite a long time before we turned into a wide lane bordered on either side by tall drooping trees. At the end of this lane was a large, grassy yard in which stood a brown house, big and comfortable looking, with many porches and windows; but instead of going straight on as I had expected him to do, Big Jake turned his course to one side and we were now on a narrow pathway. My friend evidently felt himself very much at home, and though my heart beat unnecessarily fast, I gained confidence as I watched Jake's easy-going behavior.

Having already slackened his pace to a slow walk he now came to a standstill, and, as he rubbed his chin on the topmost rail of the fence, he looked with much interest at a team of white horses which advanced slowly through a plowed field some distance away. As they came nearer, I noticed that they were decked out in new harness adorned with numerous buckles which shone brightly in the departing rays of the sun.

The white horses were drawing behind them a machine that said "click, clack, click, clack," as it moved; but most particularly did I observe the driver who wore a wide, flappy straw hat and sat on a round box and carried a long, wicked-looking whip in one of his hands.

"Gee up Clare, Clare! Samson!" he admonished, then sang a short song about "When we go marching home."

In the meantime Jake had made a discovery. Right over the fence the inquisitive nose went (unmindful of the rails which fell in a shower about us) and when it again came to the surface the heavy jaws were crunching delightfully and from between his lips dropped the tell-tale grains of yellow corn that he had stolen from the well-filled sacks which leaned against the fence.

The first mouthful disposed of before fortifying himself with another supply, Jake gave a glad whinny of recognition to the two white horses who immediately responded in a similar way.

"Gee up Clare. Get up Samson—Clare! Samson! whoa!"

The driver threw himself from his seat within a few feet of where we stood, and I jumped backward with such force as to send a barb on the wire-fence its full length into my flesh. The effect was like that of a bumble-bee sting. This mishap of mine passed unnoticed, for the driver was very busy unhitching his team, while Big Jake was cramming himself with the contents of the sack, which had by this time decreased to a marked extent.

In due season he was discovered with head ear-deep in mischief, but it seemed out of the question to bear malice to good-humored Jake, and the driver instead of punishing him pinched his neck playfully, asking where he learned to steal "seed-corn." Then the stranger's eye alighted on me for the first time. After a surprised stare he muttered under his breath, "Well I'll be doggoned."

CHAPTER IV.—BARNYARD DIFFICULTIES.

Following Jake's guidance I found myself in a lot strewn with corn-cobs. Some large buildings were scattered about and nearly all had wide doors and windows.

I began to grow frightened and drew near my protector as I beheld the growing population of the lot, which had at first seemed empty.

The man who had been planting corn came in with his team through the opposite gate, and leading the tired, thirsty animals to a long trough began to water them from a blue pump. At the pleasant, splashing sound a drove of hogs, large and small and of varied colors, came rushing out of a near-by shed uttering joyful squeals as they approached, and were given their share in troughs set low on the ground. Then a tall, proud turkey walked side by side with a baby calf no larger than myself. Hardly had they reached the well when the gate was thrown open and a dozen or more

The Standard Calicoes

"Simpson Prints" were first made in the days of thoroughness, and made to last; made so well that they became the standard, and have been ever since. The same old principles are strengthened with new ideas. Better designs are used than ever before and Simpson-Eddystone Prints are now far ahead of what they used to be.

Ask your dealer for Simpson-Eddystone Prints. In Blacks, Black-and-Whites, Light Indigo-Blues and Silver-Greys, Shepherd Plaid Effects and a large variety of new and beautiful designs.

Thousands of first-class dealers sell them.

The Eddystone Mfg Co (Sole Makers) Philadelphia

LOWELL INGRAIN CARPETS

"The all wool kind"

We have been telling you for weeks WHY you ought to insist upon getting a LOWELL INGRAIN the all wool kind—when you buy a carpet. Thousands have taken our advice and are highly pleased.

ISN'T IT TIME FOR YOU TO CONSIDER BUYING

Remember these points: Cover the whole floor—it's warmer, and easier to take care of; can be used on both sides, a great saving. LOWELL INGRAINS are made that way; can be had in newest styles and colors, just like high grade carpets. If it is wound on a hollow stick, it's a genuine LOWELL INGRAIN.

When you buy carpets, ask the local dealer for LOWELL INGRAINS. Look for the hollow stick and run no risk. Don't accept any other.

something had happened. We did our best but it was too late, for poor 'Queenie' was beyond help. We looked everywhere for the colt but not being able to find it decided that it must have gone down also. It would have been a blessing for the poor little beggar if it had; death by slow starvation is not a very pleasant fate to look forward to."

"It would have been a blessing for me anyway if the muddy waters had swallowed the brat" broke in Joe, who was beginning to recover from his injuries, which did not appear to be as bad as he at first thought.

"I dread to tell the kid," remarked another of the men as he prepared to lead the horses away, "the loss of 'Queenie' will break his heart, and the worst of it is the whole affair happened through carelessness; that old well should have been attended to long ago."

The youth who had teased Joe in regard to the leak I administered slid from his horse, and I was surprised to note the solemn look on his face.

"Poor Lyall," he said, "all this comes from his having a dad who is half lawyer and half farmer."

"That's the trouble and nothing else," returned an angry voice as its owner tried in vain to piece together harness that had been broken in the recent fray. "A man with a large farm has no right to keep a law office in the city. Everything on this place seems possessed (here he gave an impatient jerk at the lines which caused the horse nearest him to glance around with inquiring brown eyes), and a lot of us fellows hardly knowing what to do next and no one to go ahead."

At length the horses were stabled, and as the confusion dwindled down to a few "baas" and grunts, a shining buggy drawn by a handsome, spirited team came into the barn-yard. A tall, broad-shouldered man sprang lightly from the scat and was followed by a slim boy of seven or thereabouts who held in one hand a bright tin pail. The little lad greeted the workmen with shouts of welcome, and started at once to assist his father in unhitching the team.

I soon learned from the conversation of the men that the fair-bearded newcomer was Mr. Dearcot, the owner of the farm, and spoken of as "the boss" when not present.

Whatever might be his ignorance of agricultural matters, it was evident that a strong liking existed between him and his hired help. It seemed as if with his coming all discontent and irritation vanished from the men's faces as they cheerfully came forward to meet him, some offering to help with the horses, others asking advice concerning the morrow's work. He was so gentle of speech and kindly of manner that it was small wonder his helpers were encouraged by his presence.

"I know you fellows must be tired enough dragging through that sticky mud all day," he said sympathetically. "I just thought by the condition the roads are in that a person could hardly walk through the west field to-day much less farm."

The men smiled indulgently and one remarked: "We were the only ones who tried to plant corn to-day. I'm afraid the ground is too water-soaked to allow our work to count for much, but if it doesn't rain to-night I think we will make great progress the remainder of the week."

"Yes, but there is every likelihood of a heavy shower before morning; even now it is thundering," replied Mr. Dearcot as he drew off a pair of flimsy kid gloves and surveyed the oncoming clouds with a critical eye.

Every moment gaining courage I advanced until I was within a few inches of Mr. Dearcot's pretty team of golden brown horses, and they, not being used to such a midget as myself, drew long, frightened breaths and curved their shapely necks. Then for the first time I was seen by the newcomer. The boy bounded forward with a happy laugh, crying, "It's my pony's colt. Where is Queenie? Course she wouldn't stay away in that old pasture; she wanted to come home."

Poor Lyall did not know what had happened, but the man whose name was Joe put his arm around the lad's shoulder and told him how "Queenie" would never come home any more; how she had gone down in the deep, old well because the wind had blown the surrounding fence away. As kindly as the matter was explained, Lyall, child-like, refused to be comforted.

"It's a mean shame," he sobbed, his slender figure shaking with wrath and grief. "Oh, why did we turn my pony out to die?"

With a motion which betokened his disgust with the world and all that it now contained, he hurled his tin buck-

"Well, he was long, and lots slimmer than Mr. Dragon-fly. His wings were glistening and thin like lace, and he had three long, long tails out behind

him."

"Well, he was long, and lots slimmer than Mr. Dragon-fly. His wings were glistening and thin like lace, and he had three long, long tails out behind

him."

Art Program.

JEAN FRANCOIS MILLET.

I. Millet—his early life and training.

II. Preparation for his life work.

III. "The Sower."

IV. "The Gleaner."

I. The early life of this great artist was spent in a little village of France. He received his training principally from a kind father and mother and a religious and loving grandmother. He cared nothing for school, but like children of his artistic nature, preferred the field for his school and nature for his books. His was the simple life of the peasant and a pen picture of it may be both pleasing and instructive.

II. At about eighteen he left the field with his father's permission to prepare himself for his chosen work. This paper should treat of his life from about this time until he begins to paint for salons and for compensation. Many were his discouragements and disappointments, but never did he swerve from his purpose and success crowned his labors at last, although his true merit was not discovered and acknowledged till near his life's end.

III. "The Sower" may not be called a pretty picture, but it is true to life and nature. This was one of his prominent characteristics. He would be true when the French people would insist upon his making beautiful peasant girls and handsome men. He would say "your pretty peasant girls are not fit to take up fagots, to glean under the August sun, or draw water from the well."

IV. In the study of Breton you remember this picture was mentioned in connection with his "Gleaners." It will be helpful to make a study of the two pictures again. It will help one to know the real worth of a picture to give much study and thought on these great masterpieces—and the more they are studied, the more one sees of their beauty and worth. A description of these pictures as they seem to one will be very helpful, especially to the writer.

The Club President.

Helen Winslow says in speaking of what is expected of the president of a club:

"The president is looked upon as guide, philosopher, and friend—yes, more. She is expected to have a definite policy—as different as possible from her predecessor's in too many instances—to be ready to represent the club in public ways at a moment's notice, always well dressed and gracious, to arrange a line of study for her club, to keep in touch with every member, and to do several other things into the bargain. If there are snags in the club's parliamentary path, she is expected to remove them. And after she has done her best there will usually be someone who is able to find where she has fallen short of or exceeded her authority. She should then be careful not to commit her club to any action, no matter how righteous it appears to her individual mind, without the endorsement of the members."

She will see that her voice is never swayed by excitement, that her temper is always cool and collected, and that she is not governed by personal likes and dislikes. If she must call a member to order, she will do it in a thoroughly impersonal manner and with no display of irritability. If this spirit is lacking, and the president allows her voice to be a trifle sharp, sympathy will be against her and with the offending member every time, for democracy reigns on the floor of a woman's club as much as it does in a ward caucus."

INTERNATIONAL SUNDAY-SCHOOL LESSON.

Matt. 28:20; Eccl. 5:1-7; Psa. 51:6.

April 8, 1906.

Our Pledge and How to Keep It.

The expression in definite terms of a definite purpose is of first importance. The advantage of it can hardly be overestimated. In business it takes the form of a charter or contract in which the intention is defined, or the parties of the first and second part agree and consent to the terms. In government it takes such shape, for example, as the Declaration of Independence. In the religious life it is a creed, covenant, or pledge. In its best form it is not so much an expression of metaphysical opinions about doctrines as an affirmation of a desire to be something and to do something. The immanence of Jesus is the greatest aid in measuring up to the expressed ideal (Matt. 28:20). One stands or falls to himself. He knows whether or not he is keeping faith with his expressed ideal (Psa. 51:6). Too much talk about one's ideal is to be deprecated. Be not rash with thy mouth (Eccl. 5:2). One is to be, not say. Let other people do the saying.

State Temperance Union Convention.

EDITOR KANSAS FARMER:—The Kansas State Temperance Union will hold its annual convention in Topeka May 9, 10, 11, 1906. Nothing has been spared to make this convention the most notable in the history of prohibition in Kansas. The many attractions would be sufficient for a good Chautauqua Assembly. They will but reflect the character and the vast amount of work that is being done throughout the State.

There is scarcely a victory recorded in the State during the past year that the Union has not been directly connected with either conducting the fight or giving valuable assistance. In some places the fight has been long and bitter; in others a stirring up of the sleepy sentinels was all that was necessary. By careful and wise movements, the Union has largely assisted in bringing some of the best men of all parties before the voters of the State.

Every community in the State should be represented at the convention. If there is cleaning up to be done send some one and get acquainted with the force that is at work; if not, send some one and be identified with the force that will carry the warfare into the less fortunate districts of the State. Every temperance society and Church and Sunday school and Young People's Society is entitled to three delegates.

Dr. Louis Albert Banks and Rev. Father James M. Cleary, who are among the many attractions of the convention, are glants in the temperance cause. You should meet them.

An open rate of a fare and one-third from all points in Kansas and from Kansas City and St. Joseph, Mo., to Topeka and return has been granted by all railroads; excursion tickets to be sold on May 7-10 inclusive, good to return leaving Topeka until and including May 14, 1906. ROBERT MORRIS, Sec'y.

The season for seed planting is almost here and progressive farmers generally have either secured their seed or are casting about to find the best place to buy it. For some time we have been carrying an advertisement of seed-corn for W. W. Vansant & Sons, of Farragut, Ia. These gentlemen are seed-railers. They have made a study of seed-corn breeding for severay years and every grain of corn they offer for sale is raised under their personal supervision on their own farms. After it is gathered it is handled in the best possible way to make it produce the best results as seed. Being interested in building up a large business on their seed-corn, the members of this firm are very careful about cultivation, handling, and selection of their seed. In addition to this they have the very best-known varieties. It is a good plan to write them if you are in need of seed-corn. Address W. W. Vansant & Sons, box 54, Farragut, Ia.

Very Low Rates Tuesdays.

Every Tuesday, balance of the year, the Chicago Great Western Railway will sell homeseekers' tickets to Minnesota, North Dakota, and Canadian Northwest at about half rate; to other territory first and third Tuesdays. Write G. W. Lincoln, G. P. A., 7 West 9th St., Kansas City, Mo. State number in party and when going.

ARE YOU SAFE

FROM DAMAGE BY LIGHTNING?

How do you feel when a heavy cloud comes up and the lightning is flashing around you?

Do you get where you can see the barn and after each stroke wonder where it struck and almost hold your breath lest the next one strikes the barn or perhaps the house?

How many times have you got up in the night to see a neighbor's house or barn in flames and feel that you are lucky that it is not your buildings? You probaly never lost more than a stack of hay or a cow. But are you safe now? How do you know the next storm will not do the damage?

If you have our Lightning Rods on your building you are in no danger. We guarantee to keep the lightning out of your buildings.

Our booklet, "The Laws and Nature of Lightning and How to Control It" is full of valuable information, and we will send it to you free for the asking.

When buying rods look for our Trade-Mark (D and S) on the end of the spool, and make the Agent show you his Agent's Certificate. This will insure you fair treatment; will show that he is our authorized Agent, and will protect you from the fellow selling an imitation. You will find nothing else as good as the genuine Dodd and Struthers Rod.

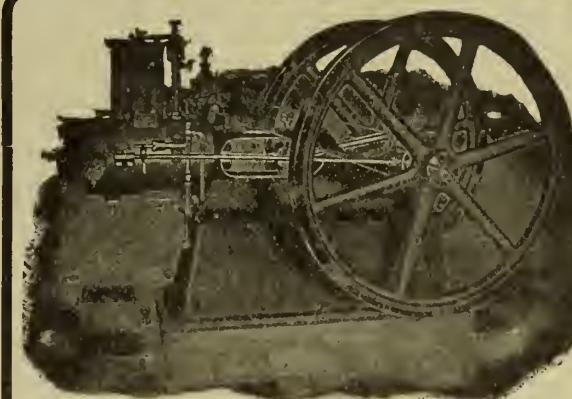

Yours truly,

DODD & STRUTHERS

Real Fence Economy

consists of getting the greatest possible fence value for the money expended. We offer you the best fence value obtainable and here is why we can do it.

We Sell Direct from Factory to the user of the fence. Thus we avoid all unnecessary and expensive handling and storing and cut out all profits and commissions of go-betweens. This makes a large saving. It enables us to spend more for good material and proper construction.

The Continuous Stay is what gives Advance Fence its superior strength. In Advance Fence the stay is never cut but runs continuously up and down across the fence for many rods without an end. Thus we preserve and utilize all the strength of the wire about half of which is wasted in fences with cut stays. Our method of construction costs a little more but it's worth while.

30 Days' Free Trial. Place your order with us for what fence you need and if after examining it you do not like it you can return it at our expense and get your money back. Don't you think this is a fair offer?

We Prepay Freight and guarantee safe delivery.

Cultivating Corn.

PRESS BULLETIN NO. 119, OKLAHOMA EXPERIMENT STATION.

In considering this operation in corn raising, it should be borne in mind that the object of cultivation is to keep the soil in the most desirable physical condition by controlling as far as possible the amount of moisture and air in it and to destroy the weeds that hinder the growth of the corn in various ways. The yields of this crop depend much upon the skillfulness and thoroughness with which this operation is performed.

The best method to follow in the cultivation of a corn crop will depend upon the character of the soil; the way in which the seed bed has been prepared; the weather conditions during the season; the number and kinds of weeds the soil is infested with and the stage of their development at the time the corn is cultivated; the age of the corn plant when any particular method is to be used; and the conditions that follow any cultivation. The fundamental truth is, in order to obtain the best results in cultivating corn, the method must be varied to meet the conditions named above, so there is no best way that applies to all fields at any time. While this is a simple fact, many do not seem to realize it, as persons can frequently be found who prescribe deep cultivation for all cases, while others claim shallow culture the only method permissible.

KEEP SURFACE ALWAYS MELLOW.

In cultivating corn, there is one point that all should agree upon, and that is that the surface of the ground should be kept mellow and loose at all times in order to prevent loss of moisture by evaporation and to keep the weeds from getting a start. This should be followed from the time the seed is planted until the grain is ripe. Just what operations are necessary to accomplish this and what else is necessary at different times and under varying conditions, is where individual judgment is called for.

CULTIVATE EARLY.

Many make their first mistake, and it is a very serious one, by neglecting cultivation. Frequently the soil is not stirred until the corn is large enough to cultivate with the old-fashioned large shovel cultivator. This usually results in the corn receiving a severe check, due to the surface being baked and hard while the corn is small and tender, and, further, the weeds generally get a start that something in the nature of a plow is required to subdue them. Often this is only partially accomplished and many are left to damage the corn during the entire season. The harrow is one of the best implements to use for these early cultivations and it should be started whenever rain has fallen to pack the soil or whenever weeds have started. Quite often this first cultivation is called for before the corn is up, and, following this, the harrow may be used two or three times. Part of the teeth may or may not be removed. A hinged harrow is manufactured that works very well on listed corn where the rows are reasonably straight and uniform in width. Cultivating in this manner, much can be accomplished in a day at small expense.

After the harrowing stage is past the method of cultivation should vary as the conditions demand. A soil is in its best condition for the growth of corn when it is open or loose enough to allow a fairly free circulation of air and moisture and penetration of the roots. This condition exists in most soils, particularly where the seed bed was properly prepared by good deep plowing or listing. When this is the case all that is desirable in cultivating is to keep two or three inches of the surface of the corn ground stirred to prevent the growth of weeds or the crusting of the surface that allows a loss of moisture by evaporation. How frequently the soil must be stirred to maintain the above condition will depend upon the number and kinds of rains and the foulness of the soil with weed seed.

SOME CASES.

There are cases where deeper cultivation than that mentioned above will be desirable and necessary. A heavy close soil may be too compact, due either to poor preparation of the seed bed or the running together of the soil by heavy dashing rains. When in such a condition, a good deep stirring, six to seven inches, with the large shovel

cultivator will greatly benefit the future growth of the corn. Again, in a season of excessive rainfall, deep cultivation may be applied in order better to aerate the soil and dry it out. Further, weeds may have become so large, due to neglect or weather conditions that prevented checking them at the proper time, that good deep cultivation is necessary in order to dig them out and cover them up. Certain fields that are infested with deep, strong-rooted perennial weeds will require the same treatment.

DAMAGE BY BREAKING CORN ROOTS.

The corn is often damaged by the roots being broken in deep cultivation. This is not the case to a serious extent early in the season when the corn is small, but the check to the crop may be quite marked if cultivated deep late in the season when the corn has reached a height of two to three feet or more, particularly if the previous cultivation has been shallow or neglected. If dry weather happens to follow such a treatment, the damage to the crop is much increased. When not followed by some form of cultivation that will level down the ridges left by the large shovel cultivator, the ground will dry out quite deeply and in the furrows between the ridges, this drying readily reaches the roots of the corn. To obviate this as much as possible, when the old-fashioned large shovels are used, the work should be followed as soon as possible with something to level down the surface. Deep cultivation is hard, slow work and under certain conditions may damage the crop. Unless there is something to be gained by it, as mentioned in some of the cases above, it should not be followed.

As handled by the average farmer, usually the corn field will require the use of the deep cultivator as well as the surface cultivator, but he makes a mistake when he plows his ground every time the surface needs stirring or tries to make one or two very deep cultivations answer instead of several shallow ones extending over the season. The mistake of too much deep plowing was partially caused by the kind of cultivators usually available a few years ago. They were suitable for nothing but deep stirring of the ground. Now the up-to-date cultivator is equipped with small shovels and more of them, three to five on a side instead of two, as formerly. This enables stirring all of the surface without going the depth of a plow, as was the case with the old big shovels. With the small shovels, the ground is left level, the work required in pulling the cultivator is much less, and more ground can be gone over in a day, making more cultivation possible. Each cultivator should be purchased with the small shovel gangs and the large shovel gangs; as has been stated, either may be needed under certain conditions.

The mistake of cultivating corn deep when the conditions do not require it or make it advisable causes considerable loss in the crop, but not carrying the cultivation on long enough during the season, causes fully as much damage.

WHEN THE CORN IS LARGE.

When the plants are too large to allow the use of a two or three-horse cultivator, the one-horse implement should be used. This keeps the surface mellow and free from weeds and the corn has as favorable a show as possible during the most critical period of its growth and that is at silking and tasseling time and during the growth of the ear. On the other hand, where the cultivations are not continued by the use of the one-horse cultivator, usually the ground is hard and covered with weeds just when the most favorable conditions are required and the corn suffers severely.

Variety Test.

EDITOR KANSAS FARMER:—Some eighty different varieties of corn will be planted at the Kansas Experiment Station as a variety test. These varieties include a large number of "farmers'" corns, seed of which has been sent to the College by farmers in different parts of the State. Other samples have been secured from outside the State, from Iowa, Illinois and Nebraska. These include most of the well-bred or "pure-bred" varieties of corn grown in the States named. The purpose of this experiment is to determine which are the hardiest and best-producing varieties of corn for planting in Kansas.

The Agriculture Department is also carrying on some co-operative experiments in testing different varieties of corn with farmers located as follows: Burden, Moran, LaHarpe, Baileyville, Linn, Norton, Dresden, Hill City, Cas-

I CURED MY RUPTURE

I Will Show You How To Cure Yours FREE.

I was helpless and bed-ridden for years from a double rupture. No truss could hold. Doctors said I would die if not operated on. I fooled them all and cured myself by a simple discovery. I will send the cure free by mail if you write for it. It cured me and has since cured thousands. It will cure you. Write to-day. Capt. W. A. Collings, Box 109 Watertown, N. Y.

lowed these crops only two seasons since the trial begun, yet marked differences in the yield of corn from the different plots have been observed, and the accumulated data of several years should give valuable results.

A. M. TENEYCK

What Is Barnyard Manure Worth Per Ton?

It has always been a difficult thing for the farmer to determine just what barn-yard manure is worth per ton as compared with commercial fertilizers. Of course manure varies greatly according to the way it has been handled. It is safe to say that its highest value is when freshly made. It can be hauled to the land in that state, before fermentation and evaporation have robbed it of its nitrogen, and it will become incorporated with the soil at its highest value.

Prof. Harry Snyder, of the Minnesota Agricultural College, is one of the best thinkers and writers on this subject in the land. He adduces the following statement in Farm Stock and Home, based on actual facts, to show the worth of barn-yard manure worth \$2 to \$3 per ton. He states that its chemical analysis shows it to be worth \$2 to \$3 per ton.

If applied to a worn-out soil at the rate of eight tons per acre, the increase in corn the first year will be twenty to twenty-five bushels per acre. This would be worth \$7. The next year the land will produce six bushels more of wheat, worth say \$4.50. If seeded to clover it would yield at least a ton more hay, worth \$5. Following the clover with wheat again, a gain of eight bushels per acre, worth \$6, will follow. Then will come twelve to fifteen bushels more of oats, worth \$1. He sums up the increase of value as follows:

"The increase in the five crops, due to the dressing of eight tons of farm manure and the production of clover, is alone worth \$25.00, making the value of the manure \$3.00 per ton distributed over five years, equivalent to sixty cents per ton as the annual crop-producing value of the manure. These are not excessive increases in yield; in many cases even larger returns are secured from the application of manure and the production of clover on worn-out land. Thus it will be seen that it is a conservative estimate to consider the manure alone worth at least \$3.00 per ton because of the increased yield secured from its application, and the additional yield is secured with little additional expense in working the soil."

Those of our readers who follow the cow census returns have noted how often comes this comment:

"Manure thrown out and hauled when convenient; liquids wasted."

The farmer who does that is following an old custom and doing no reading and thinking. Reading and thinking would tell him that there is never a better time to load that manure than every day in the stable; that when once loaded it can never be taken to the field more cheaply; that it will never go there in a shape to lose less of its value; that the cost of labor is less in winter than in the spring, when he is hurried with other work; that the barn-yard is thus kept free of a mass of filth; that the manure will be dissolved by the snow and rain, kept from fermenting and heating and become incorporated with the soil at its highest fertilizing value; that the liquids (if he has a tight gutter) will be saved, and can only be saved in this way.

What a fearful flood of waste of fertility and loss of money comes to the host of farmers who will not read and think.—Hoard's Dairymen.

Corn In High Altitudes.

Much has been said by our Eastern friends for a number of years about the impossibility of the arid sections and particularly about corn growing in the higher altitudes. They say it takes warm nights to make corn grow, and as everybody who knows anything about the higher altitudes realizes, the nights there are always cooler than in other sections nearer sea level. We must then admit, if warm nights are an absolute necessity for the growing

of corn, that Western Nebraska and Kansas and Eastern Colorado will not grow corn.

Theory is one thing. Practical demonstrations are quite another thing. When you come to soil culture in the growing of crops, theory says corn cannot be successfully grown above an altitude of 3,000 feet. Practical demonstrations say that forty bushels of good corn per acre have been grown at an altitude of 6,800 feet and this in the face of the fact that in that great corn State, Illinois, where land is worth from \$100 to \$250 per acre and where the nights in midsummer are frequently so hot that sleep is impossible for either man or mosquitoes, the highest average yield has never been in any one year more than forty-one bushels.

While there are plenty of instances along the western border of Kansas and in Eastern Colorado where corn has yielded from thirty-five to forty-five bushels per acre within the past four years, yet the limit of possibility in corn growing in these high altitudes has by no means been reached. There are many branches of science not yet comprehended. In short, but very little thorough experimentation has ever been done in connection with this branch of farming in the West. No one has yet attempted to raise corn in high altitudes on summer tilled lands and only the more common methods of fitting the soil followed by a careful culture of the crop have as yet been resorted to. Only recently have we become convinced that seed corn direct from lower altitudes or from sections where the climatic conditions are different cannot produce as good crops as the same seed after it has become acclimated.

WHERE HUMIDITY STEPS IN.

Look at your agricultural papers from Iowa and Illinois and note the great stress put upon the breeding and selection of seed corn and the wonderful results mentioned that have already been obtained thereby.

Have these scientific principles been taken advantage of with the same degree of care as that given to cultivation? By no means. Have our Eastern friends recognized the fact that the atmosphere of these higher and more arid sections is very much more dry than in Iowa and Illinois and that because of this low humidity the evaporation from the leaf of the plant is as great, while the temperature is several degrees lower than in the above States? In other words, do they know that during midday, when the temperature may be practically the same in both sections, the evaporation from the leaf of the Western plant will be much the greater?

When we realize that the greater the evaporation from the leaf the greater the growth of the plant then we must see that the disadvantages of the cooler night are very largely overcome by decreased humidity of atmosphere. Permit me to suggest in this connection that there are already strong indications that the quality of corn and other cereals grown in the higher altitudes is as a rule very much better when fully matured than of those grown in lower altitudes.

I most earnestly urge the friends of the Campbell system to begin this year and give corn growing a thorough and fair test in the higher altitudes. First of all, carefully summer-till a piece of ground of the size you desire to plant to corn. Be ready the next season with as good seed as may be obtained near by, using the earlier dent varieties. Then proceed from the first crop and select the earliest and best ears for seed for the next crop and so continue until you have fully proven the merits of summer culture, seed selection, acclimation, and our drier climate.

While you can not plant your corn as early in the higher altitudes of Colorado, Kansas or Nebraska as in the Central States, you can usually begin the cultivation earlier and thereby get your soil in better condition. If you have been careful to carry some moisture through the winter in the soil this early cultivation and careful fitting will make certain a quicker germination and a rapid early growth. One of the early important steps in corn growing is to double disc the surface as soon as conditions will permit. Then follow with the after tillage that will retain the moisture and admit of a free circulation. The latter assists very materially in warming the soil and in increasing the available plant elements.

While good results may be had by carefully fitting the soil this spring, far better results may be obtained by summer tilling one season prior to cropping. In short, the latter plan, with acclimated seeds and with the soil

properly cultivated, practically guarantees a good crop.—H. W. Campbell in the Scientific Farmer.

Here and There on the Farm.

Moist weather.

Very few oats planted.

A fine spring for seeding tame grass.

Some men haul the manure which is full of grass-seeds to thin places on the pastures or meadows with good success. In this way they kill two birds with one stone.

Take off your hat to the old sow, but don't give her too much corn at farrowing time. Don't be afraid to slop her, but commence a month before she farrows.

Many farmers are now looking for seed-corn, but most of us would be better off with some about one-third bad. Don't get the corn too thick.

Poultry pays. Select one kind and have good ones.

Do you know that cheap hen-houses are as good as any. Build 8x10 feet, 7½ foot front, 4½ foot back, 10 foot board roof, 2x4 around top and bottom. Have door and window. Strip the cracks and line with tar paper. "Too small," did you say? Build as many as you like. There is no law against it.

Hasten the parcels post. "Ask and ye shall receive." While we wait, let us fix the roads.

Natural stone should be used wherever possible in preference to wood and tin.

CHAS. WINANS.

Jefferson County.

One Way to Make a Living.

The chief industry of Bethlehem of Judea is that of the mother-of-pearl workers. The shells are brought from the Red Sea, and in the hands of native artisans are polished and carved, the larger into elaborate designs; the smaller are cut up for rosaries and crosses. The work is all done by hand, and the methods are amazingly primitive to a spectator from the home of steam and electric power. But the results are extraordinary. The largest shell we saw was carved in scenes from the birth of Christ, the Agony in the Garden and the Crucifixion, and had the general effect of delicate frostwork. Under the magnifying glass every detail was seen to be perfect in outline and in finish. It was executed to order for a wealthy American, and was to cost \$160. About 150 persons make a living by this industry, which is 500 years old. In the shops the workmen sit upon the floor, their benches in front of them; the air is full of whitish dust, and the light, admitted by the single window and the open door, so dim that the exquisite tracery of the wrought shells is a mystery even before the visitor notes how few, simple and crude are the instruments employed.—Lippincott's.

Pertinent.

A Jew who had been using a push cart to convey his merchandise through the district where he was accustomed to sell his wares finally became sufficiently prosperous to warrant his buying an old horse and wagon.

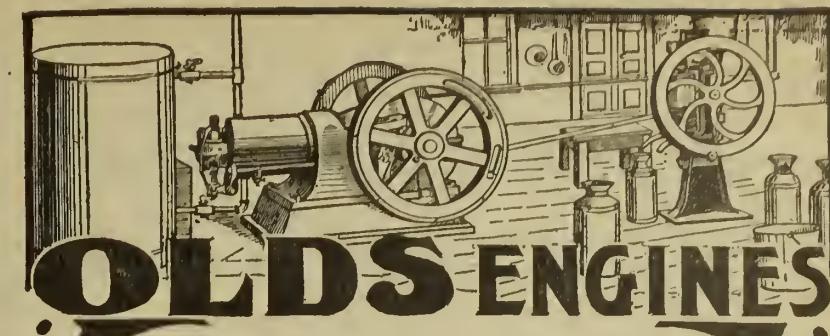

Having been too much absorbed in the prosecution of his business to pay much attention to other matters, he was profoundly ignorant of the terms used by the average driver in persuading his horse to move.

Therefore, when his rig was hitched up for the first time, and he was seated in his wagon with the reins in his hand, he patiently waited a while, expecting the horse to understand his particular part of the business. But the horse, being satisfied with the situation, did not move. Desirous of proceeding on his way, the Jew, after a period of silence, addressed the horse thus:

"Well, commence."

Indian Creek Grange, northern Shawnee County, will hold an open session on Tuesday evening, April 17, at Indian Creek schoolhouse. The program includes a debate on the question, "Resolved that United States Senators should be elected by direct vote of the people." The affirmative will be upheld by A. E. Dickenson and W. L. Reed; the negative by A. L. Brooks and J. M. Pollock. The new piano just purchased by the grange will be dedicated at this meeting. "What can be done to prevent the ravages of injurious insects," will be discussed by J. F. Clegg. This will be followed by music by Glen Pollock and a recitation by Mrs. Reed. This program deserves and will doubtless draw a full house.

Saying and doing are two things.—Henry.

OLDS ENGINES

There is no gas engine as simple as an Olds—compare it with others and this statement is proved. The repairs cost practically nothing. Every adjustment is very simple to make. Exact duplicate of any part can be furnished at once, perfectly machined and ready to put on. This is important in case of accident.

The Most Economical Engine

For running cream separator sawing wood, pumping, feed grinding, churning, and all farm work. Our reference—The User—The Man with an Olds. The reason why is interestingly told in our catalog mailed on request. Tell us your requirements and we will help you figure out what you need. Send for our catalogue showing Type A (2-8 h. p.), Type G (8-50 h. p.), Types K and N (12-120 h. p. used with our Gas Producer it will reduce fuel cost 75 per cent.)

Celebrated Picture Free

For 4c in stamps to pay cost of mailing we will also send you Rosa Bonheur's "Horse Fair," the most celebrated animal picture in the world, size 16 x 20 beautifully colored, suitable for framing.

OLDS GAS POWER WORKS, Lansing, Mich.
(formerly OLDS GASOLINE ENGINE WORKS)

20 Chestnut Street

BLOCKS OF TWO.

The regular subscription price of THE KANSAS FARMER is one dollar a year. That it is worth the money is attested by the fact that thousands have for many years been paying the price and found it profitable. But the publishers have determined to make it possible to secure the paper at half price. While the subscription price will remain at one dollar a year, every old subscriber is authorized to send his own renewal for one year, and one new subscription for one year, and one dollar to pay for both. In like manner two new subscribers will be entered, both for one year, for one dollar. Address, The Kansas Farmer Company, Topeka, Kans.

The American Boy for April will certainly please the boys, with its 101 pictures illustrating stories and leading articles of absorbing interest to the young. Boys who love animals will follow with eager delight "Shaggycoat," the biography of a beaver, by Clarence Hawks, the blind naturalist, "Shad Fishermen Casting Their Big Nets," and "Bird Migrations," by Professor Thomas. Games and sports are represented by a baseball story, it being number six of "Stories Out of the Editor's Life." Under the heading of athletics comes "My Tour of the Antipodes," part 1 of the story of Arthur Duffey's sprinting contests in Australia as told by himself. Of short stories there are "A Brave Korean," "Wolves at the Door," "The Biggest Fool at Last," and "The Truth About the Cowboy." Other titles are "Working Your Way," "Some Boys' Mistakes," "William R. Harper," "Among the Boys," "About Marbles," "Harry Castlemon," "The True History of Captain Kidd," Uncle Sam's Weather Map," "Mexican Boy Cargadores," "Sliding to Bases," "Boyhood of Great Americans," "Young Prince Joachim," "The Boys' Garden," "The Care of the Teeth," "Stamps, Coins, and Curios," "The Boy Photographer," "Experimental Lessons in Electricity," "The Wizard of Menlo," "How to Make a Sand Wheel," "Chemistry for Boys," and nearly fifty puzzles, tricks, problems, and contests that will keep the boys busy through the month. This number of The American Boy will interest every member of the family. Subscription price \$1.00 a year. The Sprague Publishing Co., Detroit, Mich.

Some Hen Figures.

Anyone with a liking for statistics may get some glorious facts and figures out of Uncle Sam's annual report on farming operations. It gives a first-class idea of just what we are doing in the way of feeding ourselves—and the rest of the world. No one has a just conception of the immensity of American farm products until he reads such a report. Take the poultry industry; annual production about 43,000,000 crates, or 1,472,042,730 dozens, or 17,664,524,760 individual and separate eggs, worth approximately \$130,000,000. These figures are amazing, yet in spite of this enormous production, it is still a fact that eggs are constantly advancing in price. The hen man needs to wake up to this fact if he aims at the highest possibilities in his business; for until this increasing demand is met and passed, prices are bound to rule higher. This being true, it is manifestly wise to take any and every course that will help production.

No better thing can possibly be done to increase laying than giving a healthy tonic in regular daily doses. All hens, and young chicks as well, need just this help in order to produce the most, or make satisfactory growth. Nothing better for the purpose can be found than Dr. Hess' Poultry Pan-a-ce-a. Thousands of successful poultrymen from all parts of the country testify to the wonderful value of this tonic. Dr. Hess (M. D., D. V. S.), has for years studied every possible condition which may exist in poultry culture, and has given the world his Poultry Pan-a-ce-a as a result. For those who do not know about this tonic let me say, it does not force egg-production by exciting or stimulating the fowl unnaturally. Instead, it makes digestion in the hen an easy and natural process,

so that every grain or spoonful of mash eaten either makes egg or flesh as Nature intended, and in the largest possible amount.

Those who use Dr. Hess Poultry Pan-a-ce-a tell us that it does positively cure and prevent disease. No flock can be sickly where it is used, because it makes the red blood which Nature requires for health, and also the necessary nitrates to carry off poisonous matter from the hen's system. By the use of this wonderful tonic, chicks are matured much earlier than would otherwise be the case; and pullets come into laying when eggs are highest and continue profitable the entire season. The cost of Poultry Pan-a-ce-a is a mere trifle compared with the great result it brings about. One cent's worth will feed 30 hens a day. Dr. Hess and Clark, of Ashland, Ohio, who prepare it, back Poultry Pan-a-ce-a with a written guarantee, so there is no risk in trying it. It is abundantly proved that if you use it as directed and occasionally sprinkle hens, roosters, and nests with Instant Louse Killer, your flock will be free from disease and uniformly profitable.

A New Labor Saver.

The Coffeyville Implement Co., Coffeyville, Kans., has placed every farmer, gardener, and florist under obligation by placing on the market a small hand disk cultivator. In these days, when efficient help is so hard to secure, any new labor-saving device will be welcomed. This little implement is equipped with three disks on each side that can be set at any angle and so adjusted as to throw the dirt to or from the plants. Both sides of the row are cultivated at once. This machine is a good weed-killer, and thoroughly cultivates the soil. It is cheap and ought to be in the hands of every man who has a garden and every woman who raises flowers. Write for a descriptive circular. You will buy one of these implements.

New Process Manufacturing Company.

At Lincoln, Kans., is located the New Process Manufacturing Co., which has some remarkable bargains to offer to our readers. You will note these bargains in their advertisement on page 413. Think of it! A complete set of chinaware for only \$1.80 and up. Twenty-six pieces of good plated table cutlery for only \$2.50. There are others. Write them for a catalogue and see for yourself. This company is reliable and will do what they promise. It only costs a postal card to get their catalogue.

"Disastrous Grape-Vine Diseases and a Remedy."

The American Steel and Wire Co. has just issued a little booklet under the above title. For the benefit that may yet be derived this spring and for information of effective treatment to be applied in the fall, we reproduce a considerable portion of the booklet. Those who desire a free copy of the booklet should address the above company at Chicago, mentioning THE KANSAS FARMER. Following are excerpts:

Chlorosis is a disease itself or the evidence of disease. The distinctive signs of chlorosis in grape-vines and other plants consist in the stoppage of growth, twigs remaining thin, the leaves turning yellow, and the plant becoming barren.

Gris in 1849 showed that chlorosis is due to lack of iron. In 1869 Sachs called attention to the necessity for iron in healthy plant growth.

The disease has been traced to too rapid growth; poorly aerated soil, excess of lime in the soil. There remains obscure causes for the disease.

Sulfate of iron is in most cases a sure cure for the disease, and the consumption of this material in Europe has reached enormous quantities.

Rassiguier discovered a simple and practical method of combating the disease, which may be best given in his own words:

"The treatment with sulfate of iron, as an antidote to chlorosis, which I invented in 1891 and tried on my own property, has furnished such results that the method has spread and experience has taught its value to both scientists and practical wine-growers.

"For the benefit of those who are still unacquainted with the details of the matter, I will briefly review the conditions to be followed as to the time, method of operating, and quantity of dressing to apply; and recount the influence of a single annual washing on chlorosis, anthracnose, and "short node" on vines, fruit-trees, and roses.

"To produce the full effect, washing should be performed in autumn, the vines most afflicted with chlorosis being treated first, as soon as the first leaves begin to fall; in fact, I think that such as are very much stunted should be treated before any of the leaves come off. Both are washed immediately after each stock has been pruned.

"All the wounds made in pruning should, without exception, be drenched with the iron solution and, in order to ensure the curing of the disease, the drenching should extend over the whole surface of the trimmed shoots (not excepting the buds, these being sufficiently protected by their downy envelope), the branches, and even the stem, as will be explained below.

"There is no need to be afraid of a more or less deep coloration of the trimmed shoots, and if any of these—insufficiently ripened, and therefore liable to perish—should succumb to the washing process, their place will shortly afterwards be found taken by vigorous buds—beside or below the dead shoots—which will bear fruit the next year. All vines, well or diseased, may be washed with advantage, as the treatment strengthens growth.

"If postponed until the cold weather sets in, the washing will have little effect, and spring washing is less efficacious against chlorosis than autumn washing.

"An active laborer with a wooden pail and a brush or, better still, a woolen rag tied up in the shape of a brush, can wash after three pruners. The solution should be a saturated one, i. e. containing 40 to 45 per cent of sulfate of iron and may be prepared in a very simple manner by placing 80 to 90 lbs. of sulfate of iron in a wicker basket or jute bag slung on a stick and suspending in a vessel large enough to hold 200 gallons of water without overflowing when the basket is immersed. After leaving over night the sulfate will be dissolved and the liquor ready for use the next day.

"Generally the results of the treatment are remarkably beneficial, and in many places a complete cure is effected the first year. However, some soils are less favorable to viticulture and require the treatment to be repeated. Chlorosis has also been cured in fruit and rose trees by washing the pruned surfaces with the same solution.

"Moreover, when the dressing is applied over the entire surface of the stock it is capable of destroying the stems of oidium, anthracnose, mildew,

and insects lodged in the interstices of narrow lands, bringing the dead furrows eight feet apart, except every fifth row which should be ten feet apart. This will allow driving through with a team for the purpose of covering the vineyard in winter and also for hauling out the fruit-crop.

"Three years' consecutive treatment of my own vines cured the stocks suffering from short node, i. e. those where the nodes on the stocky branches were only a few centimetres apart. These formerly unproductive stocks now yield a large crop, and the internodes are of ordinary length.

"First year's grafts may be treated with a 20 to 30 per cent solution, the full dose being repeated the third or fourth year.

"Thus all the foregoing maladies are curable by a single annual operation.

"I recommend the pruner to cut through the middle of the bud just above the one destined to bear fruit, so as to leave intact the protecting septum existing at this point, and which, when cauterized at the surface by the action of the sulfate of iron, preserves the adjacent internode from the effects of frost, insects, or wet, which might otherwise penetrate the pith; this internode remaining healthy, the fruit bud will be rendered more vigorous."

ANTHACNOSE OR BIRD'S EYE ROT OF THE GRAPE.

This fungus disease and its cure is so well described by Prof. O. M. Morris in Bulletin No. 64 (Jan., 1905), of the Oklahoma Agricultural Experiment Station, that we quote the article entire:

"This disease is scattered over a large portion of the territory and is doing a great deal of damage. It is one of the worst of plant diseases, as it attacks the fruit and all green portions of the plant and is very difficult to handle. Most of the methods of treatment prove unsatisfactory. The first appearance of this trouble should be vigorously met and all possible care taken to prevent its spread.

"This disease may appear at any time during the growing season. It commonly appears on the shoots soon after growth starts in the spring. Its presence on the shoots is first indicated by the darkening and sinking of the bark in small oval or oblong spots extending lengthwise of the shoots. If the disease is abundant the shoots soon have a speckled appearance. These spots usually enlarge, the greater portion remaining black with a more or less distinct line of purple around the edge. After a time the center turns gray and forms a scab; this is the fruiting portion of the disease. Limbs badly affected are severely checked in growth or killed. The leaves are attacked and on the stem and vines show the same marks as on the shoots, but on the blade of the leaf the spots turn brown. The stems of the clusters are also attacked, and where the spots girdle a stem the fruit below the girdle does not ripen but remains green and withers.

"The disease usually appears on the berries when they are about half grown. The diseased portion is brown with the characteristic red or purple margin and round in outline. The discolored part is sunken and later turns to a lighter or gray color, which is caused by the fruiting portion of the fungus rupturing the skin and forming a scab. Some varieties are more susceptible to the disease than others. Among those most susceptible to its attacks are Goethe, Agawam, Vergennes, and Diamond.

Treatment should begin early, before the buds open in the spring. The following solution is very good to apply as a wash before the growth starts in the spring:

Sulfate of iron, 70 pounds; sulfuric acid, 1 pint; warm water, 16 gallons.

The acid should be poured over the sulfate of iron crystals and then the water added. This, if well applied, will kill all of the spores that have lodged in the vines over winter. When this solution is used the vines turn black, and any part of the vine that has not turned black within a day or two after the first application should be washed again. Bordeaux mixture is of value in holding the disease in check on the growing vines."

Growing of the Grape.

E. F. STEPHENS, CRETE, NEBR.

The grape is the oldest of domesticated fruits. Doubtless, wine was made from it even before it was brought into cultivation. We read that its product was in use in Noah's time. The fruit is so easily grown that we feel sure the grape would find a place on every home if people really knew how easily and surely it can be grown. Doubtless, many people feel that its cultivation requires more than ordinary skill. Many neglect winter protection.

PLANTING.

Our habit is to plow the ground in

narrow lands, bringing the dead furrows eight feet apart, except every fifth row which should be ten feet apart. This will allow driving through with a team for the purpose of covering the vineyard in winter and also for hauling out the fruit-crop.

We subsoil these dead furrows to the utmost depth possible, using four to six horses. We then follow with disc and harrow. This helps to conserve moisture and allows the vines to root deeply. If the soil is not very fertile, we fertilize heavily with fine, old manure. We also use whatever amount of ashes we can secure to increase the amount of potash available.

Having prepared the ground so thoroughly with team-work, we are not required to dig large holes for the roots by hand. We aim, however, to plant them four inches deeper than they grew in the nursery.

If it is convenient to go to the slaughter house and secure wagon loads of bones we use those, since bones by their slow decomposition furnish one of the best and most lasting fertilizers for the vineyard.

In planting use strong, two-year-old vines. Cut these back to three or four buds. Allow two or three canes to grow the first season.

CULTIVATION.

Cultivation should be weekly from planting time until August 1, after which allow the vines to ripen. Early in November all vines should be cut back nearly to the ground, leaving enough buds to grow three or four vigorous canes the next season. Over each plant place a fork full of straw; cover this with two or three spadefuls of earth to keep the straw from blowing away.

If the work the first season has been properly done, we should have vigorous, well-established vines that will the second season make a growth of five to ten feet. Cultivate the second season similarly to the first.

TRELLIS.

Use strong, heavy posts at the end of the rows. We are using posts cut from Osage hedges planted thirty years ago. It is important that the end posts should be very heavy and should be strongly braced, otherwise, during some violent storm, the posts may break and drop the load of fruit to the ground. The remaining posts may be lighter. We prefer to use posts eight feet in height set thirty inches in the ground. It is admissible to use No. 12 wire which is lighter than fence-wire. Continue to trim the vineyard early in November of each year. The vines will remain dormant later in the spring if the covering is removed and vines tied to the trellis about the first of April.

SELECTION OF VARIETIES.

Our market is in Central and Western Nebraska. In this district the trade prefers blue grapes. Buyers are also pleased with large bunches. For such markets the Moore's Early has been found profitable and satisfactory. This variety is not as productive as the Worden or Concord and will not yield as many pounds or baskets to the acre. It, however, ripens comparatively early in the season and has usually brought us the best price per basket.

We follow this variety with the Worden, a seedling of the Concord. The Worden is of excellent quality, but has the fault of sometimes ripening unevenly, and in shipping a considerable distance the berries often fall from the stem. Its quality is better than the Concord. The Concord is the most productive of all varieties so far tested and is satisfactory in color and quality.

Those who desire a white grape will be pleased with the Empire State and Niagara. Those who desire a white wine-grape may plant the Eivira.

Those who desire a red grape of very superior quality may plant the Brighton. Care should be taken to pollinate this variety by planting along side some other blooming at the same time.

At our last State Fair the Woodruff Red attracted attention as a very promising variety. Campbell's Early and Green Mountain are desirable early varieties worthy of trial.

MARKETING.

Most grapes are marketed in the so-called eight-pound basket, holding, when well packed, seven pounds. The best results are secured by developing (1) the local market and (2) distributing the crop to other towns, not otherwise over supplied, within reach. Grapes should be handled with extreme care; baskets should be packed full, lids pressed on and securely wired. We find in our trade that the Nebraska market does not care to pay a high price for such fancy varieties.

The Best Fruit Paper

is The Fruit-Grower, published monthly at St. Joseph, Mo. The regular subscription price is a dollar a year but if you will write for free sample copy and mention this paper, you will receive a proposition whereby you may secure it one year WITHOUT COST. Everyone who has a few fruit trees or a garden, should read

THE FRUIT-GROWER
ST. JOSEPH, MISSOURI
Every issue is handsomely illustrated and from 32 to 64 pages a month are filled with interesting matter pertaining to fruit-growing and gardening. The first four issues of 1906 will be handsomely bound and devoted to the following subjects:—January, The Horticultural Societies; February, Spraying; March, Gardening; April, Small Fruits. Any one of these numbers will be worth a dollar to you. We publish the "Brother Jonathan Series" of fruit books. Send your name and address and we will tell you how to secure these books free.

Fruit-Grower Co. 169 S. 7th, St. Joseph, Mo.

Brighton, Delaware, and Empire State. The market does not seem disposed to pay for extra quality. The average merchant who can purchase Concord for sixteen to twenty cents per basket will not handle Brighton or Delaware and other choice varieties at twenty-five cents per basket. Profits are determined by quantity combined with simple fair quality. The demand for this fruit is very rapidly extending. The market is growing faster than the production.

The cost of establishing a vineyard, including vines, planting, cultivation, posts, wire, and protection is \$80 per acre. The annual yield of our vineyard is \$100 to \$136 per acre. A vineyard located where it could have a local market sufficient to absorb its product should secure larger returns.

"The Fruit-Grower's Wife and Babies and the Automobile."

PAPER BY GEORGE WEST MAFFET BEFORE THE DOUGLAS COUNTY HORTICULTURAL SOCIETY, MARCH 17, 1906.

Of all the modern improvements forcing themselves upon the country dweller most persistently, the automobile takes precedence in that it is a constant menace to the wives and babies traveling with horses upon the public highways. This thing of railroad trains leaving their tracks and racing indiscriminately here, there, and everywhere over the earth utterly oblivious to the rights of others is not to be tolerated beyond reasonable limits.

The highest court in the land has ruled that the automobile has come to stay and that the horse must learn to become accustomed to it. There is a law that antedates this and goes back to the time when primitive man fought for privacy with a shin-bone at his cave entrance; and that is "self-preservation is the first law of nature." Then there is the modern law which holds that one man may not damage another without making good the damage.

The real danger comes from the fact that the horse has not time to make up his mind concerning the approaching auto; the thing is on him like a flash and there is nothing to do but wheel around and run or dash sideways across the gutter and through the hedge or wire-fence. If the autoist would impress this upon his own mind and take the time and care to reassure a timid horse, a few lessons would suffice and soon all the horses would become educated and motor travel be made more pleasant. How the hearts of the horse owners of Lawrence do warm toward Mr. Rutter for his care with the pioneer auto; when needful he would slow down to a scarcely perceptible motion and in a very short time the horses would take no notice of the machine.

The officers of the law in the East have adopted two methods of controlling speed—a station on the boulevard snaps a stop-watch at a second station down the road—if the passing auto exceeds the speed limit, a distant officer is signalled and he heads off and arrests the approaching speeders. The second method is more crude but just as effective—the officer shoots a bullet through the rubber tire; it has been discovered that a bullet can overtake an automobile—about the only thing that can. This latter method rather appeals to the farmer and is no more dangerous to the autoists than is the machine to the driver of any horse.

Another method that can be tried

upon the utterly reckless is for each driver of a farm wagon in infested districts to carry upon the seat beside him a short club about thirty inches long and hurl it end foremost into the spinning wheels. If successfully thrown, the auto man who was in such a hurry will find ample time to talk of the weather, and can discuss matters of moment with the driver of the farm team and can make arrangements to get his machine back to town.

But a method, entirely within the law and in the long run effective, is to sue in the courts for the full value of every horse made unsafe by the owner's machine; sue for every injury done to vehicles; sue for any harm which befalls the wife and babies and ask a good round sum in addition for exemplary damages—a jury will give it to you. In this way the motorists will soon find it convenient to be decent and reasonable. For the reckless adopt reckless measures or try a writ of injunction to forever bar them from running a machine.

An automobile running six miles an hour is comparatively harmless. Fifteen miles an hour should be considered high speed. Twenty miles an hour is too high for any motor of whatever nature, except when running on steel rails. An automobile running at fifty miles an hour upon a country road should set the telephones ringing for twenty miles and should be met with a shower of rifle bullets wherever it goes.

After all, until public opinion and needed legislation shall either reduce the speed or drive the automobile from the public highways entirely, the logic of the occasion is for the machine owners to do all that can be done to reassure the timid horses. Stop promptly when shown the uplifted hand, signal by horn at road intersections, stop and help in case of accident and offer sympathy and regrets—and more important than all keep an eye far in the distance for the farmer's wife and babies, and dismount and go forward to their assistance if it is needed.

[THE KANSAS FARMER] realizes that the provocation is great, but it can not print this paper without reminding the reader that Mr. Maffet is a law-abiding citizen not given to undue use of rifle, shotgun, or club, and not likely to advise his friends to seek to cure any evil by unlawful means. Let every farmer and fruit-grower see to it that the next legislature is pledged to enact an efficient law for the regulation of automobilists.—Editor.]

The 'Phone and the Farmer.

The following extract, from a new booklet issued by the Electric Appliance Company of Chicago, clearly sets forth the many advantages of the 'phone on the farm. It strongly contrasts the old way and the new way of farming, and shows the immense progress made in agricultural lines the past few years.

"Twenty years ago it was considered nothing uncommon to rise hurriedly in the middle of a perhaps cold, stormy night and sally forth for medical assistance, or render some neighbor in distress a needed service.

To-day it is possible for the farmer to answer all demands of a neighborly or social character, transact business at a saving of time and trouble, extend and enlarge his acquaintance, enter into the spirit and activity of town life, and direct his affairs on an absolute surety of success by having a reliable 'phone in the home.

Not a day passes but some trip will be saved; not a day passes but some business transaction will be completed that will be worth the yearly cost of maintaining a good 'phone.

The rural mail service has produced some very radical changes in the social and business life of farmers in general, but the farm 'phone will eventually produce even greater changes by bringing more closely together the progressive people of town and country, whose interests must always be identical—the welfare of the one depending upon the progress and advancement of the other.

Without a 'phone on the farm every errand, little or big, demands the personal attention of some member of the farmer's family, with perhaps a team to carry him, at a loss of time and help, of both. This, too, when work is pressing and every moment means dollars.

On a farm where decided action and quick judgment are needed every hour of the day, the Iaco Farm Telephone is as much of a necessity as any other labor-saving implement on the place. In these days of competition in sales, in being first on the market, the farmer who has not a good, reliable 'phone is, to all intents and purposes, just as well isolated and apart from the actual business of a community as ever Robinson Crusoe was on the desert island."

We can heartily recommend this little book to all who are interested in building a telephone line of any description as it gives a great deal of valuable information about line building, cost of building, etc. A mention of this paper will secure the book free postage paid.

The Poultry Yard

Beware of Wet Foods for Chicks.

It is a mistake to suppose because a chick is small, that it needs to be fed mainly on soft feed. No other one thing causes so many deaths among chicks as wet corn-meal left where they can run into it with their dirty feet, and then leave a large part of it to ferment, which it is sure to do in the warm sunshine. The food for the chicks should be as nearly dry as it can be to feed conveniently, and corn-meal should never be given to small chicks except when it is mixed into a dry crumbly state. A very good feed for young chicks is a johnny cake made out of corn-meal, bran, ground oats, equal parts, a little leaf meal or dried blood and all mixed with skim-milk. But dry grains such as pinhead oatmeal, millet, cracked wheat or Kafir-corn and cracked rice can be fed to them from the start. The digestion of the young chick is naturally strong if not weakened by feeding exclusively on soft food. Some fine grit and charcoal should be placed where they can get it at will. In fact, some successful poultry-raisers claim that the first thing a young chick should have is grit. An excellent mixture for chicks from one day to six weeks old is four parts cracked oats, one of cracked wheat, two of rolled oats, one-half part of millet, one-half part broken rice, and two parts fine beef scraps. After six weeks old cracked corn can be added to their ration as well as Kafir-corn and whole wheat.

Poultry Pointers.

If one of the boys on the farm takes kindly to the care of poultry, encourage his ambitions by getting him some thoroughbred poultry, or, if you can not afford enough money to start him with poultry, give him enough money to buy a setting of thoroughbred eggs. Many a successful man owes his start in life to the ownership and management of something he "took a notion to" in his boyhood days.

Some people make a hobby of their chickens. Well, there is no higher mission of humanity than to induce men and women to ride some hobby that will make them forget the cares of business for a while each day. Let the hobby be chickens, ducks, turkeys, pigeons, or anything that will take them out into the fresh air and sunshine, away from the enervating atmosphere of four walls and a roof.

One of the real stumbling blocks in the way of successful poultry-raising is the failure to observe the practical method of improvement by selection. Where the best pulletts are carried off to market as soon as good prices are offered, and the inferior specimens retained for breeding, it is to be expected that the stock will deteriorate, and new blood is then an actual necessity every year. In this way there can be no permanent improvement in the flock. Keep the best you have for your own breeding stock.

If your chicks disappear, watch the cat, watch your neighbor's cat, watch all cats, and keep them off your premises if you have to plant a few of them. Cats do lots of mischief in the poultry-yard that is blamed on rats. Rats are bad enough, but a cat with an appetite for chickens will do more damage in a week than rats will in a month. Beware of the cat.

Training for the Show-Room and Notes About Exhibition Poultry.

No one feature of an exhibition fowl counts for so much as does the comb and other head points. What might be an otherwise very attractive head is frequently marred by an ill-shaped or crooked comb, or badly formed wattles or ear-lobes. These defects may often be improved. Here is where the experience counts. The working and manipulating of a crooked comb into a straight presentable one, the smoothing out of the wattles, or the flattening down of the ear-lobes becomes as easy to a well-trained manipulator as it does for the surgeon to work into shape any badly formed portion of the face of a child.

This may be done without being accused of faking. A little glycerin or vaseline taken between the fingers and rubbed against the badly-shaped comb may soften and work it into good form. If this is continued for a number of times a defective member may be straightened out and wattles may be improved in the same way. Never be tempted to make use of the knife or scissors to trim or cut in a way that may be apparent to an amateur when

he sees it. There are some slight surgical operations that may be performed in this way that are legitimate, but when it comes to cutting for the improvement of formation, it is seldom, if ever, a successful piece of work for the judge will soon detect it.

Fowls that have feathers on their shanks and feet may be very much improved for the exhibition hall by removing, at least sixty days prior to the exhibition, all the broken, badly-formed or colored feathers, provided they have grown long enough in the shanks and feet to have become hardened, so that the removing of them will not cause a blood flow from the shanks or toes. Old, hard, broken feathers may be removed sixty days prior to the exhibition with almost a certainty that new fresh feathers will have grown in by the time the date of the exhibition is at hand. For the heavy feathering of the large Cochins a little longer time is needed. For others the time mentioned is quite sufficient.

Nothing is better to add luster to the plumage than sunflower seed. We have known Cochins, Brahmans and Langshans to be completely fitted for the exhibition hall with whole corn and sunflower seed. This combination seems to produce long, heavy, fluffy plumage with a fine luster, and plenty of flesh and weight.

Get Rid of Vermin.

Now is the time to be looking after the vermin that through cold weather has more than likely been given the chance to get an excellent start. Even were dust-baths provided the hens through the winter, unless the dust is heated by the sun or in some other way, most hens will avoid it as they do cold water, not caring how full of vermin they get, as placed against the discomfort of that dust-bath. There may be poultry-plants free of vermin, but, if so, it has come about by the utmost diligence and frequent lookout as well as allowing no vermin-infested birds about the premises or new fowls until the newcomers have been thoroughly gone over with vermin-killers.

Sometimes it does seem a mystery where the vermin so suddenly spring from, even brooder chicks showing them. They travel, I am sure, like bed-bugs, on the hunt of desirable rations. The mites will kill the young chicks if they have become so plentiful as to leave the roosts on the hen's bodies, or to infest nest-boxes. Usually they prefer to stay on the roosts, but I have seen them black on hatching hens, therefore, the hen must have brought them. They are dark when in search of food, and red when filled. After feeding they hide away until again hungry, in the crevices of the nest-boxes.

On most farms the great per cent of mortality among young chicks is due to vermin, and this is why one must begin looking out for them in early spring, cutting off the enormous progeny they will bring forth as the warm weather comes on. Nest-boxes and coops, brooders and all fixtures from last year to be used for the new chicks must be thoroughly scalded and disinfected before this year's chicks go into them. The roosts and all parts of the poultry-houses should be scalded, whitewashed, and sprayed with kerosene or carbolic acid. The fowls must be dusted with vermin-killing powder if we want to save the chicks.

So often, when mites are plentiful on the hen or about the chicken-coops, you can not find them on the chicks and wonder why the little fellows droop and die so quickly. And yet, could you look at night and see the bloodsuckers cover the chicks, disappearing at daylight, you would know why the chicks died.

The large lice are the most formidable enemies of the small chicks. It is claimed that but one of these will kill a chick. I know that from two to four will do so, as they have a fashion of crawling under the throat and draining the blood from the large artery located there. If the weather be rainy, the vermin will increase because the fowls can not get to good dust.

In getting ready to set the hen, after seeing that not only the nest-box, but the floor and walls back of her are clean, I sprinkle either ashes, lime, tobacco-dust, or vermin-powder under the straw of the nest, and whether I find those large lice in the fluff above or below the vent or not, I take it for granted that somewhere they may be hiding from me ready to begin work when my back is turned on them, and give the hen an extra good dusting with the powder also. Once or twice I repeat this performance afterward, but not after she has been sitting twelve or fourteen days. If I find the large lice after this about her I wait until the

POULTRY BREEDERS' DIRECTORY.

BLACK LANGSHANS—Hens scoring 93 and upwards-headed by 2d and 4th prize cockerels from Kansas City 1906 show. Eggs, \$2 for 15; \$3.50 for 30; special price by hundred. Can fill orders at once. Mrs. C. S. Cross, Fair Acres Farm, Emporia, Kansas.

At Topeka 1906

Our Buff P. Rocks won all shape and color prizes awarded. Our first prize pullet scored 94 (1 for injured eye). Our winning Holland, White Plymouth Rocks, and White Wyandottes, are the same quality. We have very fine S. C. B. Leghorns. Judge Heimlich cut our White Rock cock ½ of a point for color of entire bird. Eggs from pens we hatch \$2 per 15; \$8 per 100. Standard Poultry Yards, Abilene, Kans.

White Plymouth Rocks EXCLUSIVELY.

Good for Eggs, Good to Eat and Good to look at. W. P. Rocks hold the record for egg-laying over every other variety of fowl; eight pullets averaging 280 eggs each in one year. I have bred them exclusively for twelve years and have them scoring 94 to 96%, and as good as can be found anywhere. Eggs only \$2 per 15; \$6 per 45, and I prepay expressage to any express office in the United States. Yards at residence, adjoining Washburn College. Address THOMAS OWEN, Sta. B., Topeka, Kans.

chicks are all out, then give the hen an extra good greasing with lard. As the season advances one must get more and more careful in keeping the hens rid of vermin.

Of the large kind of vermin there are more than one kind. Some are blood-suckers, some are simply after the oil in the roots of the feathers, while others riot in any filth that may cling to the fowl, but any of them, if allowed access to the little chicks, will turn to sucking blood just as the mites and large head-lice do. If these last are allowed to accumulate in the fluff of the hen to great numbers, they will eventually cause sores and a watery discharge about and from the lower intestines. And anyway, who wants eggs to eat from such infected hens? It is nothing but pure laziness to allow hens to get so full of parasites, and if allowed to go on a nest of eggs in such misery, they will break many of the eggs because of the uneasiness the vermin causes them, and smash half the chicks that come out for the same reason.—Ida M. Shepler, in Twentieth Century Farmer.

Making a Stand Against Lice.

My losses a dozen years ago from lice and mites were rather heavy, but the past few years I have not been troubled much, as I do not let the vermin get a foothold. In the first place I keep everything clean and use plenty of fresh air, I dust the fowls regularly with lice powder and use plenty of whitewash and paint the roosts with disinfecting liquid. On the young chicks I use a preparation of my own for head-lice. A little lard about the size of a pea rubbed well on the back of the head of chicks will kill lice. From my point of view it is the operator's fault if he has lice and mites in such numbers as to make poultry-raising a failure. All plants have more or less of these vermin, but they can be kept down if the operator wants to and will make a stand against them.—D. Lincoln Orr, in Farmer's Review, Orange County, N. Y.

Good Shell Material.

A great many people forget that the modern hen produces several times as many eggs as the ancient hen that was the progenitor of the one we now have. That hen laid thirty or forty eggs a year and had no trouble to find the lime in the natural food. But it is a very different matter when a domestic fowl must produce good shell material out of her food for two hundred eggs during the year. The modern hen probably eats no more lime in her food; therefore, the farmer that does not provide important supplies of lime will have trouble with his flock. The eggs will have thin shells and there will be many soft-shelled eggs which will be a temptation to the poultry to begin egg-eating. It is easy enough to furnish the material if one does not forget. The professional poultryman never forgets; but the farmer does because poultry with him is merely a side issue.

Keep an old gander if you would protect young chicks from their enemies in the shape of dogs, cats, crows, and magpies. The gentleman will be found of great use, shifting all objectionable characters with commendable promptness. Not only will intruders be smartly looked after, but the gander will make as much noise as possible while performing his duty, thus giving the poultry-keeper and game-rear warning when all is not right.—Exchange.

Passengers east from Chicago to Fort Wayne, Findlay, Fostoria, Cleveland, Erie, Buffalo, New York City, Boston, and all points east, will consult their interests and find advantage in selecting the Nickel Plate road east from Chicago. Three through trains are run daily, with through day-coaches to New York City, and modern Pullman sleeping-cars to destination. Rates always the lowest, and no excess fares are charged on any train, for any part of the journey. Modern dining-car service, with individual club meals, ranging in price from 35 cents to One Dollar; also meals à la carte. Ask for tickets via the Nickel Plate Road. Chicago depot, La Salle and Van Buren Streets, the only station in Chicago on the Elevated Loop. Chicago City Ticket Office, 111 Adams Street. Dairy Interests

The Profitable Dairy Cow.

PROF. C. S. PLUMB, OHIO STATE UNIVERSITY.

Some years ago a young man named John Winslow graduated at an agricultural college. He was born and reared on a New England hill farm. There his father won a living for the family. In the main, from the keep of a herd of cows, the milk of which was sold to a nearby creamery. It was slow work, for the profits were not large, but they made a living.

The young man had a love for the country and the farm home. He had received a district school education, and gradually the idea had crystallized in his mind that he needed more education. His attention was directed to the agricultural college. An investigation convinced him that this was the type of institution that would enable him to become a broader, brainier, and more capable farmer. Ambition, health, work brought him through college. The four years passed by rapidly, and once again he was back on the farm.

But this was a different young man returning to the farm from the callow youth who had gone out from Rockdale four years before. His intellectual forces had strengthened and his capacity for grasping and solving problems had rapidly grown. His father soon realized that the young man of 22 was no longer a boy. He was a man whose judgment he could rely upon.

On various occasions during his college life, when visiting home, John had looked over the herd, and the thought gradually grew upon his mind that the cattle in the stable were not what they should be. In his Junior year he had taken a course of instruction, which involved a term of work studying breeds of live stock. Another term was partly devoted to the principles of breeding, and the subject of feeds and feeding occupied several hours a week the third term. All through this year of study, he had been given practical work in judging live stock. His father owned a dairy herd, and the instructor in animal husbandry in the college had been teaching him important lessons, which in his opinion had a direct application to the conditions at home.

PRACTICAL TRUTHS TAUGHT.

What were some of the real practical truths that he had been taught leading up to success? He had learned by repeated illustrations, that like produced superior offspring; that no great breeding that was a part of the creed of every great breeder; that poor animals mated produced poor animals; that sires from superior ancestry produced superior offspring; that no great breeder had ever risen to heights of eminence and built up a great herd, excepting by weeding out the inferior and breeding to superior; that pedigree was worth nothing unless backed by constitution and individual merit; that no man could be regarded as an intelligent breeder who did not breed on the basis of a knowledge of some of these things.

The laboratory or practical work in judging in those college days commended itself to John in no uncertain manner. There was a large room in one corner of the cattle-barn. Tannark covered the floor. Here the instructor brought his class of young men. A cow was brought in. The students were instructed in the various points which go to make up the animal form, and their relative importance to each other. They were told what the ideal, mature cow of this kind should resemble. Then they were requested to take blank score-cards and judge and score the cow before them, and see how she would compare with the ideal described. That was not easy the first day, but more practice smoothed the way. Finally several cows were brought into the room and were ranged up side by side, and the class was directed to judge and place them in their relative order of merit.

That is just what the judge did at the county fair, only he was obliged to give a written explanation on a specially prepared sheet of paper, as to why he placed those cows in the positions he did. Then finally the instructor placed them as he thought they should be, which was followed by a discussion of the placings of both students and teacher. That sort of thing was interesting, and John saw a connecting link here between this college work and the home herd.

There was a most important phase to this study of stock. As the lessons continued, it was pointed out that there

were different types of cattle that had gradually developed into high degrees of perfection, each in its class. This was beautifully illustrated on one occasion when this subject was first discussed. Three cows were led into the room, each quite distinct in type. One was spare of flesh, in fact her ribs showed somewhat, but she had a big body, rather short, clean-cut handsome legs, a thin fairly long neck and a gracefully turned rather short head. Back between her thin, muscular thighs below a broad, level rump, was suspended an immense udder, shaped like a half moon, while extending along the belly away from the udder were two big milk veins, twisted like a snake, remarkable in their development. The instructor told the class that such an udder should extend well forward along under the belly and up high behind the thighs, be level below and thick with four medium-sized teats one at each corner of the udder, and when milked out it should shrink up and feel mellow and pliable in the hand. This was a cow of the true dairy type, just a grade, but she was rarely beautiful John thought. And when she was milked out before the class, all that striking fullness disappeared and a shriveled, wrinkled udder one-half the original size was in its place. He had never seen such a cow as that at Rockdale. Alongside of her stood a broad-backed, deep-bodied cow, full and thick in bosom and hind quarter, short of leg and strong of neck. She was smooth and rather fleshy, and her udder was not important, but she would cut some great steaks. Then he was taught that this was a cow of the beef type, given to converting food into meat as the dairy cow did hers into milk. Then there was a third cow, neither lean nor fat, sort of half way between the other two, with a fairly large udder, that they were informed was a "dual purpose cow." As this young man from that mountain farm compared these cows, and as he later on came to be more and more acquainted with the details of difference, he began to feel that the herd at home was far, far from its profitable possibilities.

There were other lessons taught at this agricultural college that bore much on future problems to be solved. The college instructor in dairying required the students to test the cows of the college herd occasionally. They were obliged to take samples of the milk of each cow of the herd at each milking for a number of days in succession, and find out how much fat there was in the milk, so as to compare values. Here John learned that two cows might be giving exactly the same amount of milk though that of one contained twice as much butter-fat as the other. As creameries paid for milk on the basis of its butter-fat content, he soon saw that quality as well as quantity was an important consideration with milk-production. Thus as he attended his daily duties about the college, he came to see that success on that dairy-farm was dependent on several things, each important in itself.

These were some of the things taught this young man during the four years prior to his home-coming, and their value was never underestimated by him. Not long after his return his father gave him a half interest in the farm, and he settled down in a partnership full of anticipation of the future.

THE ROCKDALE HERD.

There was in his herd at Rockdale 16 native cows. They were just common, plain, everyday scrubs. John's father fancied some of them mightily, but he was not fortified by facts in this position. One day the junior member of the firm came home with a spring balance. He proposed to begin weighing the daily milk-yield of each cow. He knew it would not take much extra time, and they would learn something of what the cows were doing. The senior member smiled, but thought it a harmless pastime.

John said, "Father, we don't know enough about what our cows are doing. Do you know that records show that the average dairy cow in this State produces only 150 pounds of butter a year? There have been some mighty interesting investigations made by some of our experiment stations, which prove that we dairymen have some truths to learn that we should have learned long ago. Now, for example, the Illinois Experiment Station years ago, published a bulletin giving records of individual cows on eight farms in that State. It showed that there were 144 cows in these eight herds of a year's test. One herd made a net loss of \$4.54 on each cow, some made a small profit, and one got good

FACTS COMMONSENSE THE BIG TRUTH STICK

SMASHES WORTHLESS SEPARATORS

EASY OR HARD WHICH FOR YOU

Put Facts and Common Sense to work on a Tubular Cream Separator and you know it must be easy to operate. Put Facts and Common Sense up against a back breaking, hard to wash, high can "bucket bowl" machine and you can't make yourself believe it is easy to operate. In the light of truth, the out-of-date, "bucket bowl" separators go to smash. Which kind for you, the

Cream is Cash

AT The largest exclusive Cream Butter Factory in the World

NO WAITING

NO DELAY

NO RISK

NO UNCERTAINTY

NO ANXIETY.

Cream shipped to us is paid for immediately.

Our motto is:

CORRECT WEIGHT,

HONEST TEST,

and the highest possible price for butter-fat.

Under this banner we have established an enormous business. Through a continuation of this policy, we expect to increase our business each month.

A cordial welcome awaits every enterprising milk-producer, who appreciates having his product handled economically so as to get the greatest returns and that in cash.

It's a pleasure to answer letters. Will be glad to hear from you.

Very respectfully,

**BLUE VALLEY CREAMERY CO.,
ST. JOSEPH, MISSOURI.**

Peerless Cream Separators

Reasons Why the 'PEERLESS' is the Best

- 1st—Twice the capacity of any other bowl. That is to say two times smaller than any other bowl of equal capacity.
 - 2d—Compound feature, two bowls in one, hollow bowl, and disk bowls, combining all the features of the tubular and disk machines.
 - 3rd—Enclosed frame. Free from dust. Injury resulting from machine impossible.
 - 4th—Perfectly noiseless.
 - 5th—Heavy enough and strong enough to lift a box car, which insures durability.
 - 6th—The bushings made of phosphor bronze—the most serviceable material for the purpose. Fitted and guaranteed to be accurate to $\frac{1}{2}$ of 1-100 of an inch.
 - 7th—Every journal bushed with brass or phosphor bronze. This fact together with the fine adjustment described above, accounts for the light draft of the Peerless machine. Each bushing is made in duplicate and interchangeable and if at any time they show wear they can be replaced at small cost.
 - 8th—at normal temperature the skimmed milk will always show less than 5 100 of 1 per cent of butter-fat and generally less than 1-100 of 1 per cent butter fat. PEERLESS CREAM SEPARATORS are guaranteed to anybody—everybody, anywhere—everywhere.

You Can't Afford to Make a Mistake

Not in buying a cream separator. You can't afford to get a machine that needs constant repairs, or one that turns hard, or one that wastes cream, or one that breaks up the butter fat and produces poor cream, or one that is hard to wash—one that makes work for the good wife. You can't afford it. You need not do it.

Omega Cream Separator

on trial and find out for yourself whether or not the claims we make for it are true. It produces better cream, it causes less bother, it saves more work, it's easier on you, in every way, than any other cream separator made. Try it and see. That's all we ask.

A Trial Costs You Nothing.

And after you try it on your own farm you know for sure how easily it runs, how close it skims, how easily it's cleaned. Send your name today for trial offer and catalog.

This Book Free to You.

New book, "More Milk Money," tells how to care for separator cream; how to make good butter; how to select good dairy cows; how to prevent "white specks" in butter; how to wash and wash butter, and a hundred other things you ought to know. Ask for it and catalog. Free if you mention this paper, tell how many cows you keep and give address of a neighbor who keeps cows.

**The Omega Separator Co.,
23 Concord Street,
Lansing, Mich.**

Just think, six of these eight had cows that did not pay for the food they consumed. They found all sorts of records among these cows, but the one that had the best showing gave 8,945 pounds of milk and made 472 pounds of butter, while the poorest cow produced only 1,482 pounds of milk, which yielded but 63 pounds of butter. The average production of butter of seven of the herds was only 202 pounds a year, and I don't see how there is any money of importance in it for us if we can't beat that sort of record. So I propose to find out what our cows are doing."

It wasn't long before the whole family had begun to study the daily milk-sheet. The days crept by, and the milk record grew more and more interesting. Finally John proposed buying a Babcock fat-testing machine, and testing the milk of the individual cows for butter-fat content. They had tested the herd milk at the creamery, but this was not enough. This innovation came in more easily. The fascinating and suggestive work of the scales was emphasized by the Babcock. The months rolled by, and all the time John was investigating and thinking. Bill Brown, their nearest neighbor, didn't take any stock in such foolishness, and he knew the Winslow family would land in the poorhouse yet. He was just waiting for that joyful day, when he might say, "I told you so."

You remember that John learned something of dairy and beef type when in college. After he graduated, Prof. Haacker, of the Minnesota Experiment Station, wrote a bulletin which contained a record of his researches on dairy-cattle, in which he showed that cows of the dairy type had a special value over the other sort. This bulletin laid on the dining-room table, and the old gentleman picked it up and began to glance over its contents. There were some pictures in it, and these caught his eye. They represented cows of different types. Then he began to look over the contents of the bulletin. Finally he said, "John just look here. You know you have talked to me about this farm business with cows, but it never struck me as amounting to much. But this man Haacker seems to have a pretty good bit of evidence here that there is some meat in the cocoanut. He has been feeding some cows out there at the Minnesota Station, and he kept a record of every bit of food they ate and of all the milk each cow made and of the butter-fat in her milk. My, but that was a big job though. Now, he has divided up his herd into those with dairy type and those of general-purpose type, and this is what he shows they have done. He had 20 yearly records for each class. The dairy-type cows produced an average of 7,876 pounds of milk and 430 pounds of butter. The general-purpose type produced an average of 6,035 pounds of milk and 295 pounds of butter. In this book here, he says, that by valuing the skim-milk at 15 cents per hundred and

allowing one-eighth the milk for cream, there is an excess of \$2.42 in favor of the dairy-type cow for skim-milk, and allowing 16 cents for butter, the 135 pounds gain of the butter of this type gives a further gain of \$21.65. Adding this to the \$2.42 gives a total of \$24.07 in favor of dairy over general-purpose type. He also found that the fatter the cows were, or the less belly they had, the less money there was in them. Guess we'd better look into that, John."

(To be continued.)

The Feed and the Quality of Milk.

I find in a recent number of the Rock Island Enterprise a statement as follows:

"It seems that a number of dairy farmers here are laboring under the impression that the class and quantity of feed has a great deal to do with the percentage of butter-fat in the milk. Dr. G. A. Foote, M. Mortensen, K. U. Westerterps, and others who have made a scientific study of the matter say this is a mistake; that you can only get a certain percentage of butter-fat no matter what you feed, and the only way to increase the amount of butter-fat is to increase the quantity of milk."

Please tell me through your paper whether this is correct.

E. J. KNOWLLOY.

Rock Island, Texas.

- Butter-fat can only be fed into cows by increasing the yield of milk. The per cent of fat can not be increased materially by the class or quantity of feed. If this were not true, Holsteins could be made to give Jersey milk by feeding them oil meal, bran, and alfalfa, and Jersey milk could be reduced to from 5 to 3 per cent by feeding prairie hay, sorghum, and silage. This is entirely out of reason and scientific experiment.

The per cent of fat in the milk of any cow depends on her individuality. If it comes natural to her to give a large quantity of 3 per cent milk on full feed, she will only give a smaller quantity of 3 per cent milk on less or poorer feed. No two cows in any herd give exactly the same per cent of fat in their milk, although they may receive the same amount of the same kind of feed.

Kansas Experiment Station.

Septic Tank for Liquid Manure.

Before next winter this farm may be feeding 10 or 12 milch cows, and I shall endeavor to use all the stable manure and possibly, by building a cement floor and cistern, save and use all liquid manure. The best way of building a cow-barn and cistern and for utilizing this liquid manure. I have yet to learn, so am open for instruction. There is no barn-yard here yet. The pasture is close up to the barn. The rains drain away down the hillside the best of the stock-droppings.

FRANK S. GRISWOLD.

Johnson County.

Your letter regarding the utilization of liquid manure, which has been referred to me, can best be answered by referring to the use of a septic tank. This tank is so constructed below the surface of the ground that all of the liquid may drain into it from the bottom. It is made of cement similar to a cistern and will retain the liquid until forced to an over-flow spout by the inflowing matter. It is made with two or three separate divisions, with an over-flow in each so as to retain each day's inflow for at least 48 hours. By this means most of the organic matter is decomposed by the aid of bacteria of various kinds, and rendered soluble and ready for use by plant life. The organic matter is thus turned into the most profitable fertilizer known, besides being useful for irrigation. The liquid thus passed off, if the tank is working satisfactorily, ought to be almost clear.

A septic tank should purify sewage 40 or 50 per cent, that is, it should decompose organic material to that extent. The chief benefit of the septic tank, however, is that the liquid passing through it is much more easily utilized for it contains no solid material to clog the irrigating pipes.

C. W. MELICK.

A correspondent expresses some uneasiness lest, when every farmer goes into dairying instead of raising corn and wheat, the price of dairy products shall decrease so much as to leave no profits in dairying. That condition does not yet appear on the horizon. Dairying has the advantage of affording quick returns and, where good cows are used, liberal profits. It is an exacting business, however, and can not well be entrusted to the exclusive care of hired help. Milking must be done twice every day. Profits depend upon careful and competent milking and judicious feeding. Until an efficient milking-machine

IMPORTANCE OF BUYING CREAM SEPARATORS THROUGH LOCAL AGENTS

This heading voices a most important consideration in the purchase of a Cream Separator, and points a most serious objection to the purchase of such a machine by the "mail order" method, even if good separators were sold in that way.

While the Cream Separator is a simple machine when once understood, it is nevertheless of the greatest possible importance that it be set up and started just right, and that the user have the brief personal use instruction necessary in its handling and operation. If not it may mean several years of difference in the life of the machine and a good many dollars of difference in the results from its use.

Then, no matter how carefully used, things do happen even to the best of separators. It makes a lot of difference if you have a competent man near at hand to tell you just what is wrong and how to fix it. It makes even more difference to be able to get necessary repair parts right and quickly instead of having to send off to some distant concern for them which only sells machines somebody else makes and whose employees would not know a separator if they saw it and the parts for which are more likely to be wrong than right when you do finally get them.

All this is the business of the local agent of DE LAVAL machines. It is just what he is expected to do for users. Of course he makes a small commission out of it, but the user can mighty well afford to pay that commission and it would be a big mistake to try to save it even in the purchase of a good separator. It is still more so in the purchase of the kind which is sold in the "mail order" way.

The buyer of a Cream Separator should never lose sight of the big DAILY difference in dollars-and-cents results between the good machine and the poor one. A DE LAVAL catalogue to be had for the asking helps to make plain these differences.

U.S. Cream Separator

Osceola, Ia., Jan. 15, 1906.

After trying different makes of cream separators I decided to buy a U. S. as it is the easiest to clean, built most solid, and I believe will last me as long as I live. Have had my separator over two years, and it has made me \$20.00 more a year per cow than I made before. I figure that my calves raised on U. S. Separator skim milk pay for keeping my cows.

The cream is clear profit. I make over \$40.00 a cow clear a year. I don't feed any grain, so I consider I am doing well. If I didn't have over 12 cows I believe I could get good interest on my investment if I had paid \$500.00 for a U. S. Separator. I keep books, so there is no guess-work about it.

T. G. Armstrong.

What the U. S. has done for Mr. Armstrong it will do for you. Write now for a copy of our big handsome 1906 U. S. Separator catalog which tells how and why. Address—

WALNUT GROVE FARM ...FOR SALE...

Upon the advice of several specialists I am going to New Mexico for my health. On this account I must dispose of all my Kansas property, including the famous Walnut Grove farm, the most complete and profitable stock farm in Kansas. This includes 130 acres of the best land in Kansas, two miles from Emporia. Over 200 good O. L. C. hogs. All our Barred Plymouth Rocks, 36 Collies, 44 head of cows, 8 head of horses, the best farm house in the State. Also one small farm house, 2 large barns, 2 large cattle-sheds, one 300-foot hen house, one 250-foot broiler house, 20 brooder houses, capacity of plant, 4000. The best hog house in the West, double-deck cement floors; many small hog houses. This is not an experiment, but a successful stock farm. Price, \$20,000 cash.

H. D. NUTTING, Emporia, Kans.

shall be introduced, there will doubtless continue a disposition to abandon dairying, however profitable, and to engage in some less exacting kind of farming as soon as the farmer feels able to sacrifice the ready income afforded by the dairy. On this account, as well on account of the constantly increasing demand of the markets for dairy products, there is little probability that dairying will soon be overdone.

Weekly Weather Bulletin.

Following is the weekly weather bulletin for the Kansas Weather Service, for the week ending April 9, 1906, prepared by T. B. Jennings, station director:

NOTE.—Beginning with the present issue, the first for the season of 1906, this publication will be known as the WEEKLY WEATHER BULLETIN of the Kansas Section of the Climatological Service of the Weather Bureau. It succeeds the Weekly Crop Bulletin series heretofore published in this form. The crop feature is omitted, but the weather data are given in greater detail.

CLIMATOLOGICAL DATA FOR THE WEEK

WESTERN DIVISION.

Stations	Temperature	Precipitation	
	Maxim-	Minim-	(In
	um	um	inches)
Colby	77°	26°	0.69
Coolidge	82°	27°	1.25
Farnsworth	85°	28°	1.06
Norton	83°	30°	0.85

MIDDLE DIVISION.

Yates Center	77°	33°	1.84

GENERAL CONDITIONS.

The weather the past week was an agreeable change from that prevailing during the preceding month.

Under the influence of an area of low barometer the temperature over Kansas was raised considerably and the highest temperature for the season was experienced in the

RAINFALL FOR WEEK ENDING APRIL 7, 1906.

SCALE IN
INCHES:

Less than $\frac{1}{2}$. $\frac{1}{2}$ to 1. 1 to 2. 2 to 3. Over 3. T. trace.

western counties. This was followed by falling temperature, cloudy weather and rain, causing Wednesday to be the coldest day of the week. With the passage of the area of high barometer Friday, the weather became much warmer and the maximum temperature in the middle and eastern counties for the week generally occurred that day. Under the influence of an area of low barometer, central in Colorado on Saturday morning, showers were general in this State Saturday and the following night.

The minimum temperatures for the week were below freezing in the extreme northern and western counties.

CONDITIONS IN DETAIL.

EASTERN DIVISION.

Allen.—The week was warm, the 2d and 5th being the warmest days while the first was the coolest. The 1st and 2d were clear; the 3d, 4th and 7th cloudy and rainy and the 5th partly cloudy but rainy.

Bourbon.—We had much sunshine and two rainy days; good growing weather.

Brown.—A fine week; the lowest temperature, 32°, occurred on the 1st and the highest, 72°, on the 2nd and 6th.

Chase.—The weather has been rather damp with three rainy days. The day temperatures were warm on the 2d, 3d and 6th.

Coffey.—The 1st and 6th were clear, the other days cloudy and rainy, yet the weather has been good for vegetation.

Crawford.—This has been a warm, pleasant week with a fair amount of sunshine.

Greenwood.—This has proved the first good growing week of the season, being warm and damp with a fair amount of sunshine.

Jackson.—The week has been cloudy with four rainy days.

Linn.—With three clear days, four cloudy days, and three rainy days, the weather has been good for vegetation.

Lyon.—Though the temperature reached 70° on three days yet the week has been cold and wet, the minimum temperature falling below 40° on four days.

Montgomery.—The weather conditions were normal: the rain on the 4th and 5th delayed work but was needed to soften the ground. The week closed with cloudy weather and more rain.

Riley.—With rain on six days, frost on one and the minimum temperature below 40° daily, the week has not been good for the growth of vegetation.

Wilson.—The past week has been warm and springlike with much sunshine. Rain on two nights and one day was very beneficial.

Woodson.—The past week was a better growing week than we had had yet this spring. Three days with good rains and a fair amount of sunshine have been beneficial.

Wyandotte.—While the week has been warm, it has also been wet, rain falling every day but one. Six days were cloudy and the other one partly cloudy.

MIDDLE DIVISION.

Butler.—The 1st, 2d, and 6th were clear; the 5th partly cloudy and the remaining days

cloudy. The highest was 69° on the 2d and the lowest 33° on the same date.

Barton.—Rain fell on the 2d, 3d, 4th, 5th, and 7th. The first of the week was clear, the middle part cloudy and the last part was partly cloudy. It was very cool on the 4th but warmed up some towards the close of the week.

Clay.—The first and last of the week were warm and the middle part was cool and rainy. There was rain on the 2d, 3d, 4th, 5th, and 7th.

Cloud.—Showers fell on the 3d, 4th, 5th and 7th. The highest temperature was 76° on the 6th and the lowest 35° on the 4th. The 1st, 5th, and 6th had considerable sunshine but the other days were cloudy and damp.

Cowley.—Rain fell on the 3d, 4th, and 7th. The highest temperature was 75° on the 2d and the lowest 37° on the 6th. The middle of the week was cool, damp, and unsuitable for outdoor work.

Ellis.—Much sunshine during the week. 1st, 2d, 6th, and 7th warm days, 3d and 4th cold and rainy; good shower on 7th; hurricane, wind, and storm of dust afternoon of 7th.

Ellsworth.—Rain fell on the 3d, 4th, 5th and 7th, and on these days the weather was very disagreeable.

Harper.—Rain fell on the 4th and 7th.

Harvey.—The weather has been cloudy most of the time and very damp and rainy; over an inch of rain has fallen.

Jewell.—Rain and cool, damp weather prevailed on the 3d, 4th and 5th; the other days were clear and warm. The highest temperature was 77° on the 6th and the lowest 33° on the 3d, 4th and 5th.

Kingman.—The first of the week was clear, the middle part cloudy and damp and the last part was partly cloudy. Rain fell on the 3d, 4th, 5th and 7th. The highest temperature was 74° on the 2d and the lowest was 30° on the 4th and 5th.

Osborne.—Rainy disagreeable weather prevailed on the 3d, 4th and 7th. The forepart of the week was clear and pleasant.

Pawnee.—The first of the week was fine and clear, but the middle and latter parts were mostly cloudy with showers on the 3d, 4th and 5th. The thermometer rose to 76° on the 2d, but the minimum temperatures were in the thirties all week.

Pratt.—Rainy, damp weather prevailed on the 3d, 4th and 5th. Maximum temperatures the first and last of the week were in the seventies, but the minimum temperatures ranged in the thirties the middle of the week. The moisture for the week was excessive.

Reno.—Showers fell on the 3d, 4th, and 5th and a trace of rain on the 2d. There was no sunshine on the 3d and 4th but the first and last days of the week were clear and pleasant. The lowest temperature was 35° on the 4th and 5th. On the 4th the maximum did not rise above 41°, but on the 6th occurred the highest temperature of the week, 73°.

Reino.—Showers fell on the 3d, 4th, and 5th and a trace of rain on the 2d. There was no

sunshine on the 3d and 4th but the first and last days of the week were clear and pleasant. The lowest temperature was 35° on the 4th and 5th. On the 4th the maximum did not rise above 41°, but on the 6th occurred the highest temperature of the week, 73°.

Reno.—Showers fell on the 3d, 4th, and 5th and a trace of rain on the 2d. There was no

sunshine on the 3d and 4th but the first and last days of the week were clear and pleasant. The lowest temperature was 35° on the 4th and 5th. On the 4th the maximum did not rise above 41°, but on the 6th occurred the highest temperature of the week, 73°.

Reno.—Showers fell on the 3d, 4th, and 5th and a trace of rain on the 2d. There was no

sunshine on the 3d and 4th but the first and last days of the week were clear and pleasant. The lowest temperature was 35° on the 4th and 5th. On the 4th the maximum did not rise above 41°, but on the 6th occurred the highest temperature of the week, 73°.

Reno.—Showers fell on the 3d, 4th, and 5th and a trace of rain on the 2d. There was no

sunshine on the 3d and 4th but the first and last days of the week were clear and pleasant. The lowest temperature was 35° on the 4th and 5th. On the 4th the maximum did not rise above 41°, but on the 6th occurred the highest temperature of the week, 73°.

Reno.—Showers fell on the 3d, 4th, and 5th and a trace of rain on the 2d. There was no

sunshine on the 3d and 4th but the first and last days of the week were clear and pleasant. The lowest temperature was 35° on the 4th and 5th. On the 4th the maximum did not rise above 41°, but on the 6th occurred the highest temperature of the week, 73°.

Reno.—Showers fell on the 3d, 4th, and 5th and a trace of rain on the 2d. There was no

sunshine on the 3d and 4th but the first and last days of the week were clear and pleasant. The lowest temperature was 35° on the 4th and 5th. On the 4th the maximum did not rise above 41°, but on the 6th occurred the highest temperature of the week, 73°.

Reno.—Showers fell on the 3d, 4th, and 5th and a trace of rain on the 2d. There was no

sunshine on the 3d and 4th but the first and last days of the week were clear and pleasant. The lowest temperature was 35° on the 4th and 5th. On the 4th the maximum did not rise above 41°, but on the 6th occurred the highest temperature of the week, 73°.

Reno.—Showers fell on the 3d, 4th, and 5th and a trace of rain on the 2d. There was no

sunshine on the 3d and 4th but the first and last days of the week were clear and pleasant. The lowest temperature was 35° on the 4th and 5th. On the 4th the maximum did not rise above 41°, but on the 6th occurred the highest temperature of the week, 73°.

Reno.—Showers fell on the 3d, 4th, and 5th and a trace of rain on the 2d. There was no

sunshine on the 3d and 4th but the first and last days of the week were clear and pleasant. The lowest temperature was 35° on the 4th and 5th. On the 4th the maximum did not rise above 41°, but on the 6th occurred the highest temperature of the week, 73°.

Reno.—Showers fell on the 3d, 4th, and 5th and a trace of rain on the 2d. There was no

sunshine on the 3d and 4th but the first and last days of the week were clear and pleasant. The lowest temperature was 35° on the 4th and 5th. On the 4th the maximum did not rise above 41°, but on the 6th occurred the highest temperature of the week, 73°.

Reno.—Showers fell on the 3d, 4th, and 5th and a trace of rain on the 2d. There was no

sunshine on the 3d and 4th but the first and last days of the week were clear and pleasant. The lowest temperature was 35° on the 4th and 5th. On the 4th the maximum did not rise above 41°, but on the 6th occurred the highest temperature of the week, 73°.

Reno.—Showers fell on the 3d, 4th, and 5th and a trace of rain on the 2d. There was no

sunshine on the 3d and 4th but the first and last days of the week were clear and pleasant. The lowest temperature was 35° on the 4th and 5th. On the 4th the maximum did not rise above 41°, but on the 6th occurred the highest temperature of the week, 73°.

NEW BOOK

JUST ISSUED

SUCCESSFUL FRUIT CULTURE

A Practical Guide to the Cultivation and Propagation of Fruits.

By SAMUEL T. MAYNARD,
Formerly Professor of Horticulture at the Massachusetts Agricultural College.

This book is written from the standpoint of the practical fruit grower; it is up to date in every particular, and covers the entire practice of fruit culture. It gives in plain, practical language, descriptions of such varieties as are most in demand in our markets, and the methods practiced by the most successful cultivators of many sections of the country. Separate chapters are devoted to the apple, pear, peach, apricot, and nectarine, plum, cherry, quince, mulberry, grape, blackberry, raspberry, cranberry, strawberry, blueberry, buckwheat, subtropical fruits, propagation of fruit trees and plants, fruit growing under glass, insect pests and fungous diseases. The chapter on the apple is particularly comprehensive and complete, forming a monograph in itself. The chapter on forcing peaches, grapes, strawberries, and other fruits, describes the most successful methods of the present day, and is the most recent practical treatise on this important industry.

Illustrated, 5x7 inches, 265 pages. Cloth. Price, postpaid, \$1.00.

Barn Plans and Outbuildings

New, revised and greatly enlarged edition,
Modernized and brought up-to-date

EDITED BY EDWIN C. POWELL

A reliable guide to those intending to build new barns or to remodel old farm buildings for any and all purposes.

The proper and economical erection of barns and outbuildings requires far more forethought and planning than was ordinarily given to their construction. But with modern ideas, proper appreciation of sanitary conditions, and the use of labor-saving implements, a barn that twenty-five years ago was considered perfect would not meet present requirements.

Outline of Contents:

After an introductory chapter on the general rules to be observed in barn building, special chapters give detailed information and illustrations on

GENERAL FARM BARN
CATTLE BARN AND STABLES
DAIRY BARN
CATTLE SHEDS
SHEEP BARN AND SHEEDS
PIGEONRIES
POULTRY HOUSES
CARRIAGE HOUSES AND HORSE BARN
CORN HOUSES AND GRIDS
ICE HOUSES

ICE HOUSES AND COOL CHAMBERS
DAIRY HOUSES
CREAMERIES AND CHEESE FACTORIES
SPRING HOUSES
GRANARIES
SMOKE HOUSES
DOG KENNELS
BISOS
ROOT CELLARS AND ROOT HOUSES
BUILDINGS OF VARIOUS KINDS, ETC., ETC.

All descriptions and directions contained in this volume are given in so plain and clear a manner as to be readily understood by anyone. Every professional builder, and every person, be he farmer or otherwise, who intends to erect a farm building of any kind, can, in this book, secure a wealth of designs and plans for a very small sum.

With 375 illustrations, 5 x 7 inches, 401 pages.

Cloth, price, postpaid, \$1.00

FRANK IAMS

and his "Big 4" three year old Percheron stallions, weight 8340 pounds. Winners of 1st, 2d, 3d and 4th prizes at Iowa and Nebraska 1905 State fair (over all). They are "sensational show stallions"—"Iams' sort." Iams sells models like these "Peaches and Cream" stallions at \$1000 and \$1500. It's up to you, Farmer John! Will you be "humblegged" by "bunco salesmen?" Iams owns and sells more 1st-class stallions than any man in the United States. He has his "town of horse barns" filled to the roof with wide-as-a-wagon "black boys."

50—STALLIONS—50

2 to 6 years old, weight 1700 to 2600 pounds, 90 per cent blacks, 50 per cent tan stallions." All registered, approved and stamped by European Government. Dad, it's "100 to 1" that Iams is pushing his competitors off the roof and hypnotizing his buyers with "top notchers" at 50 cents on the dollar, "let live prices," Iams' "horse show" at Iowa and Nebraska State Fair was the "talk of the town." The "best ever." All winners and sons of winners. His 2, 3 and 4 year old Percherons, Belgians and coach stallions won every 1st, 2d, sweepstakes and grand sweepstakes prize at Nebraska State Fair. At Iowa State Fair they were winners of 90 per cent of same prizes in above classes, and the Iowa and Nebraska people said Iams is a "hot advertiser," but "he has the goods" better than he advertises. Teddy, it's "16 to 1" that Iams' "Peaches and Cream" stallions are "hot stuff" (for competitors). "It's a clinch" that Iams saves his customers thousands of dollars in commissions and middlemen's profits. Iams places \$1000 insurance for \$60.

\$1000—SAVED AT IAMS—\$1000

Ikey! What a rich graft these "slick stallion salesmen" are working on the honest farmer selling 4th rate stallion at \$2000 to \$5000. Iams sells "top notchers," so good, big and cheap that they do not need to be peddled to be sold. Mr. Buyer, see Iams' stallions yourself. Take no "gold brick stallion salesman" word. Iams has "the goods" you read about. His establishment is worth going 2000 miles to see. Iams makes his competitors "holler." He is knocking "high prices" out of the Xmas tree. Iams saws wood, "butts in," sells more stallions each year. He makes every statement good. Georgie, dear! Buy a stallion of Iams. His \$12 ½ stallions are much better than our neighbors paid those Ohio men \$4000 or. Then I can wear the diamonds. Iams speaks the languages, buys direct from breeders, pays no buyers, salesmen or interpreters, has no two to ten men to divide profits with. Iams guarantees to sell a better stallion at \$1000 to \$1500 than are sold to Stock Companies for \$2500 to \$5000 by slick salesmen, or pay you \$100 for your trouble, you the judge. Iams pays horses' freight and buyer's fare; gives 60 per cent breeding guarantee. Write for eye-opener and greatest horse catalogue on earth. References: St. Paul State Bank, Citizen's National Bank, St. Paul, Nebraska.

The Lincoln Importing Horse Com'y

Lincoln, Nebraska

Now we are here with our catalog. It is ready for distribution. Parties contemplating buying stallions write for catalog. Remember, every stallion represented in the catalog is of our own importation and all of them this year's importation, except the group of three. We also have a large number of stallions not exhibited in our catalog. Note what we say in regard to this group. The three weigh 5,890 pounds; the largest stallions in the West in the same flesh. Some of our 2-year-olds of our last importation will tip the scales at 1,850 to 1,900 in only moderate flesh. Come and examine them at our expense if you find that we have misrepresented to you. Remember, our scales are in front of our office. You do your own weighing.

In selecting the foundation of my herd I was careful to get the best Cruickshank breeding and individuals to be found, and they cost me from \$500 to \$1000 each. This consignment is made up of choice young animals, many of which I would have preferred to keep, but it being my first sale in the West, I desired to make it an attractive one. All cows and heifers old enough for service will be safe in calf, or have calf at side by the Scotch bulls whose pedigrees will appear in the catalog, which will be sent on application. Breeding lists furnished at time of sale. This will be a good time to get choice show cattle and herd-henders.

CREAM SEPARATOR

\$19.90 IS OUR PRICE FOR THIS WONDERFUL NEW IMPROVED 1906 MODEL HAND CREAM SEPARATOR

AT ABOUT ONE-FOURTH THE PRICES CHARGED BY OTHERS we furnish the highest grade hand cream separators made in the world. Compared with any other separators made, ours has greater capacity, skims closer, skims colder milk, runs easier, is stronger, less liable to get out of order, will wear longer and, besides, our price is a mere fraction of what others charge.

**WE GIVE YOU TWO MONTHS' FREE USE
AND FREE TRIAL,**

we issue a binding twenty years' guarantee, we take care of your separator for you free from the day you receive it, and we will always in the years to come furnish you any needed repair or part promptly on a day's notice. IT IS SO EASY TO HANDLE that by following the simple printed instructions we send you, anyone, without previous experience, can operate it at once and do better and more work than can be done with any other separator made.

**OUR SEPARATOR WILL SKIM 1,000 POUNDS OF MILK PER HOUR
AND DO IT CLOSER, BETTER AND EASIER THAN ANY OTHER SEPARATOR OF LIKE
SIZE WILL SKIM 500 POUNDS IN ONE HOUR.**

OUR SEPARATOR WILL SKIM TWICE AS CLOSE, twice as much, twice as easy, last twice as long as any other hand cream separator made, and yet we furnish it for just a few dollars compared with the prices charged by others. Our price is based on the actual cost of material and labor, and is a small part of what others charge, and our terms are so liberal, too.

OUR BIG FREE SEPARATOR BOOK

**THIS BIG BOOK IS
FREE
FOR THE ASKING.**

IT WILL BE SENT TO ANY ADDRESS BY MAIL, POSTPAID, FREE ON APPLICATION

It's the most complete book and catalogue on cream separators ever published; contains more information and is worth more to anyone who owns cows than all other separator books or separator catalogues ever printed, yet it will be sent to any address by mail, postpaid, free on application. This wonderful free book is new (just out), fresh from the printing press.

**IT IS 14 INCHES LONG,
AND 7 INCHES WIDE,**

a thick, heavy, free book and catalogue; shows our separators in their exact colors, contains endorsements of the biggest banks in the country, copies of guarantees, certificates, free trial proposition, free sixty days' use in your own home offer, copies of diplomas, awards and medals taken in competition with other separators at expositions all over the world, tells just what the freight charges will be on any separator to all parts of the United States, contains endorsements, testimonials, references, guarantees and comparisons as made between our machines and all other separators by customers of ours, farmers in the leading towns in every state. The big free book tells you how we can make the price so low, why our machine is better than any other made is made very plain, why it is stronger, lighter running, will skim closer, is easier to clean and has about double the capacity of any other separator, is all made very clear in this free book. This big free book shows pictures of every piece and part of our wonderful separators, full and detailed description of everything that goes to make up the best separator in the world, all shown by handsome pictures and complete descriptions, pictures of the factory and all manufacturing book, just from the press, tells more about cream separators than you could possibly learn from any separator agent or salesman or from all other separator catalogues yet published, and the big book is free for the asking, will be sent to any address by mail, postpaid, free on application. We are glad to send it to you free whether you ever buy a separator from us or not, so whether you own one cow or a hundred cows, few or many, don't fail to write for this big free book with our many new and astonishing free offers.

On a postal card or in a letter to us simply say, "Send me your free Cream Separator Offer," and you will get this Big Book and all, FREE, by return mail, postpaid.

OUR GREAT FREE OFFER

ON A POSTAL CARD or in a letter to us simply say, "Send me your free Cream Separator Offer," and you will receive by return mail, free, postpaid, our latest big

SPECIAL HAND CREAM SEPARATOR CATALOGUE

and special book (just out), the book that is illustrated and described hereon, the big thick book, 14 inches long and 7 inches wide, with all the pictures of machines, parts, departments, buildings, equipment, challenges, certificates of test, guarantees, free trial, free use, diplomas, awards, medals, official and general endorsements, competitive tests for light running, close skimming and great capacity and endurance, as given by our farmer customer friends in competition with all of the leading separators in all parts of the country. When you write for this big free book you will also receive

**OUR TWO MONTHS' FREE TRIAL
AND FREE USE PROPOSITION
AND WE WILL SEND YOU WITH THE BIG BOOK OUR LATEST AND
THE MOST LIBERAL CREAM SEPARATOR
OFFER EVER MADE**

Everything will go to you by return mail, postpaid, free with our compliments. If you have one cow, two cows, a dozen cows or a hundred cows, more or less, if you are already using a separator of any kind, if you have any thought of buying a separator, regardless of what offer any other maker or seller may make you, if you are the owner of one or more cows, any number, don't fail to write us. On a postal card or in a letter to us simply say, "Send me your free Cream Separator Offer," and get the big book, the new catalogue just out, the great book on Cream Separators, with all the many new, attractive and astonishing offers. Do this by all means before you think of buying any other separator from any other maker or seller at any price on any terms or conditions. First, get our latest and most wonderful offer. Remember, simply on a postal card or in a letter to us say, "Send me your Cream Separator Offer," and everything goes to you by return mail, postpaid, free.

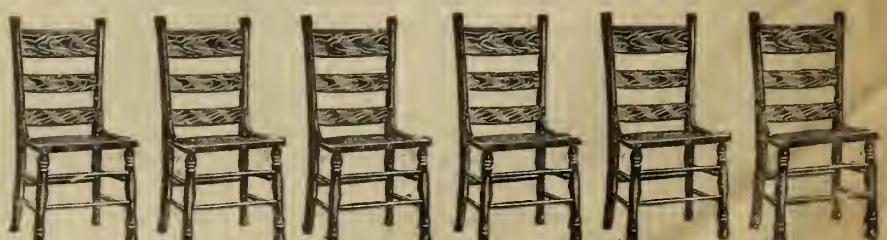

**OUR SEPARATOR WILL SAVE YOU FROM
\$10.00 TO \$15.00
A YEAR ON EVERY COW YOU KEEP,**

Paying for itself several times over in a year; besides, remember, two months' use costs you nothing. Don't fail to write and let us mail you our free book and wonderful free trial and free use separator offer.

THESE SIX CHAIRS FREE

WE WILL SEND YOU FREE these six large sized, beautifully finished, hand-somely embossed, hardwood, cane seated chairs when all your orders to us have amounted to \$50.00, or you can have your choice of many other valuable pieces of furniture or other useful things; a buggy, harness, saddle, bedroom suite, organ, couch, dresser or your choice of hundreds of similar valuable articles. All this will be fully explained when you write for our latest free cream separator catalogue.

If you do not keep cows, if you have no use for a cream separator at any price, on any kind of an offer, if no price, however low, no offer, however liberal, no terms, however unusual, would interest you in a cream separator, then please do us the favor of handing this paper containing this announcement to some friend or neighbor who keeps cows, for we urge everyone who keeps cows, few or many, to write us on a postal card or in a letter, saying, "Send me your free Cream Separator Offer," and get everything we will send by return mail, free, postpaid. UNIVERSITY LIBRARY

KANSAS FARMER

Volume XLIV. Number 16

TOPEKA, KANSAS, APRIL 19, 1906

Established 1863. \$1 a Year

New Zealand: A Land of Peace and Plenty

BY WILLIAM BRUCE LEFFINGWELL.

New Zealand was discovered by Capt. Abel Jansen Tasman in 1642, after whom the Tasman sea is named. This sea extends between New Zealand and Australia and is from 1200 to 1400 miles wide.

Tasman did not meet with a cordial reception from the natives. Upon attempting to land he found them decidedly inhospitable, so much so that they seized and murdered several of his sailors.

He, in his reports, described the country as one of great scenic beauty and destined to become one of great commercial interest to the world when once civilization was in force and the natives subjugated by the domestic influence of the white races. His attempt to land, his repulse, and his lack of sufficient forces to conquer the natives, led him to other scenes, and the country was not visited by other explorers until the year 1769, when Captain Cook landed on the islands and through himself and associates began the opening up and development of the country.

STOCK IS INTRODUCED IN THE COLONY.

An acorn drops from a gigantic oak and mingles with the soil. An unimportant event at the time, but by the law of nature, which causes propagation and reproduction, the acorn is nursed by the rains, the dew, the sun, and the soil, until its life-producing qualities assert themselves; the acorn forms into a sprout; it bursts from its shell; it struggles through the soil, drawn by the magnet of the sun's rays until a modest tip of green peers timidly through the earth, grows into a twig and time changes it into a mighty tree. Capt. Cook was a philosopher, a philanthropist, a far-seeing individual. He gave to the natives three animals hitherto unknown to them. They were common pigs, and he charged the natives with the importance of protecting them and leaving them to multiply, assuring them that their fecundity was such that in years to come they could depend upon their increase for food of the most substantial and delicious character. Those pigs which had withstood an ocean voyage for many months were turned adrift to shift for themselves and to live as best they could. The climate, the herbage, the wild berries, the density of the bush, all combined towards rapid reproduction and protection, and as the years rolled along the prediction of Captain Cook came true for the natives were able to hunt the wild pigs for food and sport. The wild hogs of New Zealand are plentiful now in the mountain pastures and the white hunter finds rare sport in pursuing them and adding to his collection boar's tucks of immense size.

Little is known in America of the exact location of New Zealand, and it is very rarely indeed that one will speak correctly of its location, unless perchance one has visited it. An erroneous impression is that it is a part of Australia. This is wrong. It is not a part of that country and is situated 1,250 miles from there, a distance traveled only by sea and requiring three days and three nights when on the fleetest steamers.

New Zealand has a government of its own and one of the best in the world. It is not a part of Australia in any sense of the word, but commercially is

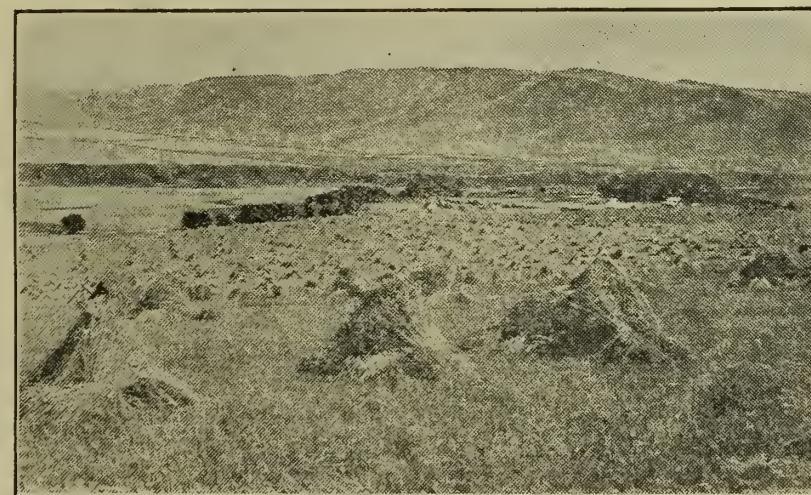

in close touch, as Australia is one of its best customers in buying many of the various products which New Zealand produces in great abundance.

HOW NEW ZEALAND IS REACHED FROM THE UNITED STATES.

New Zealand is divided into three islands, the north, the middle and the south or Stewart Island. It has 3,000 miles of coast line, is about 1,000 miles in length, taking a direct line from

PROPERTY LINES VS. U. S. SURVEY LINES.

EDITOR KANSAS FARMER:—You will greatly oblige me if you will quote the law on a corner-stone controversy in which I am interested. The facts are as follows: Over twenty years ago this section was resurveyed by the county surveyor and the crooked lines straightened with the consent of the owners of the land affected. One half-section corner-stone was lost some time after by being washed under with soil. Another surveyor came to hunt it, but not finding it, he planted another one on a straight line with the two outside-section corners. A schoolhouse was built and a hedge set out on one side of the road, and the road has been worked and used by the public by this second stone since 1887.

Wheatfields, Canterbury, New Zealand.

north to south, contains a trifle over 104,740 square miles and is 5,000 miles due southwest from San Francisco. From this latter port is the direct route to New Zealand from the United States. Steamers sail from San Francisco every twenty-one days and it requires seventeen days to make the journey. The journey is full of interest, as one day en route is passed at Honolulu, and another at Pago-Pago, the first in the Hawaiian, and the second in the Samoan Islands. At these places you obtain an opportunity of seeing the natives in their pristine state, and, again, as they have progressed under the refining influences of Christianity and education.

New Zealand has a population of a trifle less than 1,000,000 of which there are about 40,000 native Maoris. This latter race is thoroughly in touch with the white race and are good citizens. They have their lands, set apart by the Government, and are thoroughly happy and contented.

IMMENSE CROPS ARE RAISED.

The climate of the colony is simply delightful. The temperature averages about 55 in the winter time, and from 65 to 75 in summer. The rainfall is constant, always to be depended upon, with the result that they raise enormous crops and have never known a failure of them. The farmer needs no shelter, no sheds, no protection for his stock. I visited the country in the winter months and saw millions of sheep and cattle grazing in fields which were not only supplying them with food in abundance, but fattening them as well. When farmers desire to hasten the marketable condition of sheep and

(Continued on page 435.)

The first stone, which was lost, has reappeared some time since 1887, but has not been used. Now it is shown by the surveyor's field-notes that this first stone was set in a Government monument, and the second one is 17 feet to one side of it, but is on a straight line and has been used as a corner-stone by the public since 1887. The question that I would like to have answered is this: Does the continuous use by the public since 1887 establish this stone as the legal corner, even though the other one was set on a Government corner and has reappeared and has been present for a number of years? EMIL WERTNER,
Sumner County.

This statement of facts shows a situation that may well give rise to doubt as to the legal aspects of the case. But the fact that the Government marking of the corner in question was lost for a time is of little, if any legal consequence, in regard to the location of that corner, in view of the fact that it was subsequently discovered and conclusively identified. The position of that half-section corner determines the point common to the four quarter-section lines which meet at this corner.

The next question relates to the location of the public road. The road has been used for twenty years where it now is. If this use was with the understanding by the public and by the owners of the adjacent lands that it was not on the section line, there would seem to be little if any doubt of the legal right of the public to continue the use of the road at its present location. But if it be a fact, as it

probably is, that the road is legally described as being along the section line, the further fact that through an error the public used a slightly different route than that regularly established does not probably prevent the owners of lands, thus accidentally used by the public, from insisting that the public desist from such use of their lands and confine travel to the prescribed limits along the section line. This point will be further considered.

The third question and one that is closely connected with the second is as to the ownership of the land. It was agreed among the owners of the land affected to have a resurvey and the line straightened. It is, of course, presumable that all were satisfied and that contingent benefits were sufficient to compensate those who lost a few feet of land for its value. If this agreement had been reduced to writing, had named a valuable consideration, and had been duly recorded, it would be conclusive and would establish the county surveyor's line as the actual line of the properties affected by the agreement. The fact that the parties interested—to say nothing of the general public—have occupied and claimed ownership of these lands according to the agreed lines for more than fifteen years goes far to establish these agreed lines as the true property lines under the Kansas statute of limitations. This statute is contained in chapter 95 of the General Statutes of Kansas. Section 10 of said chapter says: "Actions for the recovery of real property or for determining any adverse right or interest therein can only be brought within the periods hereinafter prescribed after the cause of action shall have accrued, and at no time thereafter." Here follows an enumeration of various causes of action for each of which a limitation varying from two to five years is named. Then follows: "Fourth, An action for the recovery of real property not hereinbefore provided for, within fifteen years."

Under this fourth clause the Supreme Court held in the case of Wood vs. M. K. & T. Railway Co., 11 K. 348: "A mere trespasser without color of right or title, who has been in actual possession of real estate for fifteen years, claiming title thereto, becomes the owner of the property by virtue of the statute of limitations, if the property has been owned during all that time by some individual and not by the United States."

This syllabus is quoted with approval in a decision reported in 52 K. 465. In this later case the court further says:

"To establish an adverse possession, actual, personal, and continuous residence on property is not required, if there are evidences of occupancy at all times, which are open and visible to any one coming there, of such nature that any one would naturally suppose that whoever put them there claimed the land."

There is then little doubt but that the land lines are legally and permanently as they have been recognized by improvements and possession for more than fifteen years.

Returning, now, to the question of the road—the public as well as the land owners have doubtless understood that the road was along the property lines. There have been more or less confused notions as to the variation of the property lines from the section line, but these have had no practical effect upon the use of the road along the property lines instead of along the section lines described in the records. The fact that the road has

been thus practically located along the property lines for more than fifteen years makes the statute of limitations a bar to any action or suit to change the location of the road.

The conclusion, then, is that while the section line is not changed on account of what has occurred as related by our correspondent, but must forever remain where placed by the Government-surveyors, the property lines and the road are actually and permanently as they have been recognized and used for more than fifteen years.

ACCESS TO THE PUBLIC HIGHWAY.

EDITOR KANSAS FARMER:—I am using a road through another party's land in order to reach the traveled highway which is my only way of getting out. Can you tell through THE KANSAS FARMER whether the party owning the land can close this road without warning, and how I should proceed to get a road out in case it should be necessary? This road in question has always been used from this place and for a number of years. R. W. P.

Leavenworth County.

The right to an easement across the land of a neighbor may or may not have been acquired by this correspondent. His statement is not sufficiently explicit when he says: "This road in question has always been used from this place and for a number of years." If a definite road has been continuously used across the neighboring tract for fifteen years by our correspondent and his predecessors in occupancy of the farm he now owns, he has probably a right to such road by "prescription." In any case it is better to talk the matter over with the owner of the land over which the road passes and to come to an understanding if possible. It will be better to pay a reasonable price for a written grant of right to use this road than to go to law about it. But if the owner of the land will not be reasonable, recourse to legal proceedings will in this case be necessary. If the road has been used for fifteen years or more, the owner of the land can be prevented from closing it by injunction. If the road has not been in use for as long as fifteen years and there has been no grant of right-of-way from this correspondent's farm to a public highway, and no agreement can be reached for such right-of-way, it will be necessary to proceed under chapter 112, Laws of 1874, which is included in chapter 154 of the General Statutes of Kansas, beginning at section 39. The expense of proceeding in this way to obtain a road is to be "paid by the person for whose benefit the road is located," as provided in section 41 of said chapter 154.

The law provides a sure method of obtaining the road. It should be used only in case an understanding can not be reached without resort to law.

Our correspondent should call on the nearest justice of the peace or township trustee, either of whom will loan him a copy of the statutes from which he can read the sections herein referred to.

HOME-MADE LIGHTNING-RODS.

EDITOR KANSAS FARMER:—Could you through your paper give a description of how to construct and put up a cheap but effective lightning-rod to be used expressly for stables and out-buildings? I want one that I could put up myself and made of common wire.

McPherson County. J. I. ANDERSON.

The cable-copper rods are probably the best. If one desires to put up a rod without the assistance of a lightning-rod man, he may buy at a hardware store three-quarter-inch round iron of sufficient length; take it to the blacksmith and have the pieces welded into one continuous rod; have three or four fairly sharp prongs welded on at and near the top; drag it home behind the wagon and erect it. Before erecting he should make a hole in the ground for the lower end of the rod. This lower end should be placed deep enough to be in earth that is always moist. If it reaches to permanent water, so much the better. The rod may be attached in any manner to the building for support. It should extend well above the highest point of the building. If the building is very long, it may be better to erect a rod at either end. Such a rod will last for many years if made of iron; if made of steel it may rust off at the ground, leaving the building quite as much exposed as if no rod were used.

Another way to make a "rod" that will be good while it lasts is to twist together several strands of galvanized wire; cut all loops at the end that is to become the top and separate them slightly. Erect and support as above suggested for the iron rod. An advantage of the wire "rod" is found in its

capability of being bent to conform to the surface upon which it is to be placed. Unless the wire is heavily galvanized it will rust off at the ground within a few years and must then be renewed. The resting may be considerably retarded in both the iron and the wire rods by carefully coating with asphalt, especially where the soil comes in contact with the metal.

BLOCKS OF TWO.

The regular subscription price of THE KANSAS FARMER is one dollar a year. That it is worth the money is attested by the fact that thousands have for many years been paying the price and found it profitable. But the publishers have determined to make it possible to secure the paper at half price. While the subscription price will remain at one dollar a year, every old subscriber is authorized to send his own renewal for one year, and one new subscription for one year, and one dollar to pay for both. In like manner two new subscribers will be entered, both for one year, for one dollar. Address, The Kansas Farmer Company, Topeka, Kans.

Mrs. Florence Shaw Kellogg, of Fay, Russell County, Kansas, is writing for publication a series of articles on Mother Bickerdyke whom so many of the old soldiers have reason to remember with gratitude. Mrs. Kellogg would be greatly helped in her labor of love if she could have for a brief time the letters which so many of the old soldiers have from Mother Bickerdyke. Any such entrusted to Mrs. Kellogg's care will be scrupulously preserved and carefully returned.

Miscellany

The Agricultural College Y. M. C. A. Building Funds.

EDITOR KANSAS FARMER:—Much interest is being shown by the students of the Agricultural College in the canvass which is being carried on by the three leading farm papers of Kansas. Naturally this would be so when it is understood that the students themselves have subscribed about eleven thousand dollars to the fund. The students from each county are being organized into groups which meet and talk over plans for interesting the people of their respective counties. The various county papers are requested to call the attention of their readers to the canvass, and in addition many personal letters are being sent out by the students, appealing to their friends to take some part in this movement. If the people all over the State could only see things the way the students do, there would be no trouble whatever in raising the money.

Last spring one of the young men made a pledge of \$75 to the fund. He immediately set about earning this. To save expenses he stopped eating at the club and began to batch. Then he got work at the college barn, putting in seven or eight hours a day besides carrying on his regular work at college making a passing grade in all of his studies. About a month ago this student came around with the last of his \$75. He not only had made all of his expenses, but had saved \$75 in addition for the Y. M. C. A. building.

This student is only one of many who are sacrificing their time and money to the cause which means so much to the students. The most of the students who have given heavily will reap no direct benefits from their sacrifices inasmuch as they will have graduated by the time the building is erected. Of the thirty-six who subscribed \$100 each, only two or three are now in college. The others have felt the need of a building and are unwilling that the thousands of future students should have to do without the advantages that this building would certainly bring.

W. W. MCLEAN, Gen. Sec.

The following letter from Mr. James Dukelow, a prominent fruit-grower, of Hutchinson, explains itself:

"Mr. W. W. McLean.

"Dear Sir:—Having seen your appeal in THE KANSAS FARMER to the farmers and citizens of our great State for funds to build a Young Men's Christian Association building at Manhattan, I beg to say that I know of no more worthy object. When I visited the college some time since and saw the crowds of young men and young women come together from the four corners of the State away from their homes, I thought what an opportunity to make Christian citizens of this coming generation, yes, and generations to come.

"I hope that my fellow citizens of

Kansas will take this opportunity to let the country at large see that they value what is Christ-like, and that our young people seeking a secular education will be also supplied with a spiritual education, which will fit them not only to be citizens of our great State, but will also fit them to be citizens of Heaven. Please find enclosed check for \$100."

The subscriptions now stand as follows:

State Sunday School Convention.

The 41st annual convention of the Kansas State Sunday School Association will be held at Lawrence, Tuesday, Wednesday, and Thursday, May 1, 2, and 3, 1906. The railroads have announced a rate for the round trip of one fare plus fifty cents. Entertainment in the best homes of the city at a dollar a day, or fifty cents for lodging and breakfast. Every Sunday School in Kansas is entitled to a delegate. Pastors and superintendents are delegates ex officio. Persons desiring appointment as delegates may secure it by applying to the officers of the county or State Association. Last year over 1,200 delegates from 94 counties constituted the Hutchinson convention. A greater number is expected at Lawrence in May.

General Secretary Marion Lawrence, of Toledo, Ohio, Prof. D. B. Towner, of Chicago, Prof. E. P. St. John, of Hartford, Conn., and Rev. W. Gardner Thralla, of Freeport, Ill., will be in attendance throughout.

There will be twin meetings at night. Special conferences are planned for elementary teachers, for county secretaries, for pastors, and for teachers of adults. A session in the State University Chapel and a visit to Haskell Institute are in prospect.

For programs and further information address, J. H. Engle, General Secretary, Abilene, Kans.

Articles Concerning Labor.

EDITOR KANSAS FARMER:—Would be very much pleased if you would refer or send me articles concerning the labor unions.

MILES REGMER.

Kay County, Oklahoma.

Write to the Commissioner of Labor, Washington, D. C.

The tea used in the immediate household of the Emperor of China is treated with the utmost care. It is raised in a garden surrounded by a wall, so that neither man nor beast can get anywhere near the plants. At the time of the harvest those collecting these leaves must abstain from eating fish, that their breath may not spoil the aroma of the tea; they must bathe three times a day, and, in addition, must wear gloves while picking the tea for the Chinese court.

Modern Silage Methods!
That is the title of our new 216 page book. It tells everything anybody could possibly want to know about the silage subject. You can't find a question that it does not fully answer. How to build, from foundation up, all kinds of silos. All about the crops and how to cut and fill. How to feed, with the most complete feeding tables ever published. About 40 illustrations help to make things plain. Used as a text book in many Agricultural Colleges. We have always sold the book for 10 cents, but for a limited time, to any reader who will ask for it, and name this paper, we will send a copy free. Write at once.
SILVER MFG. CO., Salem, Ohio.

New Zealand a Land of Peace and Plenty.

(Continued from page 433.)

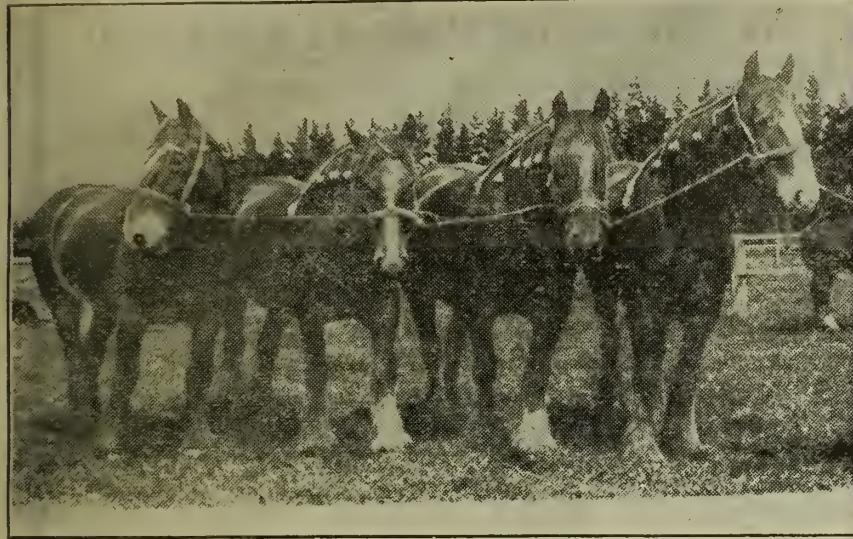

cattle they feed them turnips and mangels. I saw fields of turnips which their owners informed me would average 60 tons to the acre, and mangels which would average 90 tons. The New Zealand farmer does not speak of his turnips and mangels by the bushel, he invariably says they will run so many tons to the acre. It is nothing uncommon for farmers to raise three crops of potatoes on the same piece of ground in one year.

THE DAIRY INDUSTRY.

The dairy industry is advancing rap-

ing now being carried on by the Government brings the dairy products up to the highest standard. A full staff of instructors and graders are kept constantly employed throughout the year and now all dairy produce is graded by department officers before export. A lady instructor has recently been appointed for the purpose of visiting the various private farms throughout the colony and instructing the farmers' wives and daughters how to make up-to-date butter.

Upon visiting the factories I found everything scrupulously clean and everything conducted in a thorough business manner. American machinery is much in favor, and I saw familiar

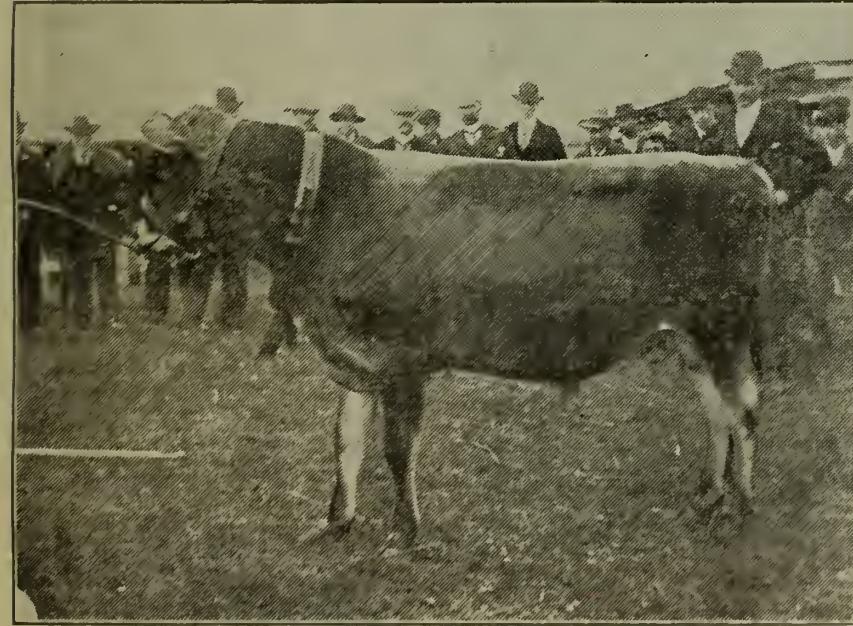

First-Prize Team of Geldings Hawker Bay Show, New Zealand.

idly and is now one of the most important. Its inception was crude, as new beginnings usually are, but the Government foresaw its importance, how it would add to the success and happiness of the people, how it would add to the wealth and prosperity of the nation, and has encouraged its advancement in every way. The dairy exports during the past year are as stated hereafter in this letter, but it is only beginning. The Government has passed laws for dairy inspection and grading, has introduced modern methods of skimming and caring for the milk, advances money on certain conditions for the establishment of creameries, and is doing everything possible to promote, to increase, and aid an industry where nature is doing her part from one year's end to an-

separators and other modern conveniences and necessities in these factories.

A WONDERFUL GRAZING COUNTRY.

New Zealand is a magnificent grazing country, undoubtedly the best in the world. During my travels I noticed many more sheep than cattle. This is accounted for from the fact that sheep-raising is more profitable. The demand is always great for lamb and mutton. New Zealand lambs bring the highest price of any in the London market, and the supply never exceeds the demand. The market is not always so good for cattle. The cattle raised in the colony are Shorthorns, Herefords, Angus, Ayrshire, and Jersey. Of the pure breeds there are more Shorthorns than all others combined, and about twelve times as many

Dairy Stock, Palmerston Show, New Zealand.

other. When you consider the fact that dairy stock requires but little feeding other than it gets from grazing, that fattening food grows tons to the acre, that no torrid suns, no winter storms or cold retard the condition of the dairy cow, but that year in and year out the sun shines, the rain falls, the grass grows, and she eats until her heart is content, and then lies down, complacently chews her cud, and if capable of philosophizing, says to herself, "What a happy bovine am I; plenty to eat, plenty to drink, and nothing to do but eat and rest."

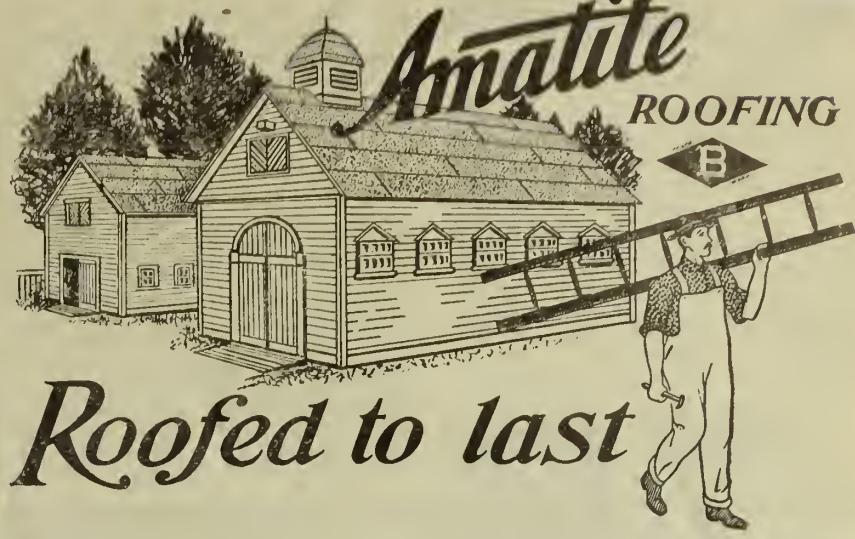

And consider too the condition of the dairyman. No frozen feet or hands, no stall feeding, no stable cares, but he milks his cows in the open air where birds, whether in summer or winter, are singing in the tree-tops and the hedgerows where the foliage is constantly green.

The system of instruction and grad-

crosses as all the pure breeds. At the end of the year 1904 there were 1,593,547 cattle in the colony.

The dairy interest is greater in the north than in the middle island, while the grain products are much larger in the middle than in the north. The equator is crossed in going from San Francisco to New Zealand and an apparent transposition of nature is seen. That is, the farther south you go the colder it becomes. The north island of New Zealand, therefore, is warmer than the south. Its soil is volcanic and many tropical fruits will grow there which would be destroyed by frost farther south. In the north island, or Auckland district, apples, peaches, pears, apricots, oranges, lemons, grapes, and all the products of the temperate zone will grow in great abundance. It is an excellent district for grape-growing.

The fruit industry receives highly

WALK AWAY when the job is done and forget about your roofs for years. Amatite will do its duty winter and summer, year after year, without any attention or coating or painting. Amatite is self-reliant.

Whatever may have been your experience in the past with ready roofs, we now offer one that will stand **every test**. What we want you to do, is to try Amatite.

Cover a small building with it. The cost is very little. We are confident you will find it beyond question the **best roof covering** that has ever come under your notice.

When we say that Amatite is **water-proof**, we mean just that precisely.

Water can not get through Amatite, and if you follow the very simple directions for laying, you will have dry, warm and comfortable buildings for many years.

It is proof against climatic changes. The hot rays of the sun,

and the severest cold have no effect upon it. It is simply the best defense against the elements made.

If you want to know anything further about Amatite write to-day for our booklet. We have made quite an interesting story of the origin of Amatite and its history up to date, and we will be glad to send this book free with Sample, to any one interested in the roofing subject.

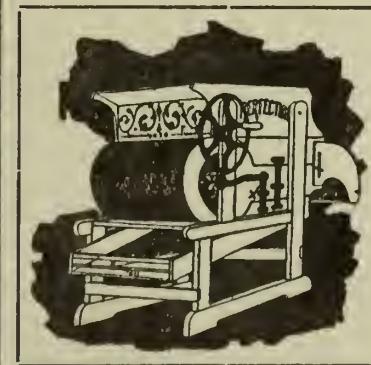

When you get the sample, don't glance it over, and throw it away. Subject it to the same tests that a roof would be likely to receive—it will come through all right—but we want you to prove it yourself.

Get the sample at once. A line to any of the offices mentioned below will bring it by return mail.

Barrett Manufacturing Co., New York, Chicago, Cleveland, Boston, Allegheny, St. Louis, Minneapolis, Philadelphia, Cincinnati, New Orleans, Kansas City.

Do You Know?

That one handful of noxious weed seed to a bushel of your grain, if planted, will absolutely ruin the crop. There are many cleaners that will remove all but that last handful of the weed seed from your grain, but the "**Perfection**" is the machine that does the work the way it should be done. Better own the machine that is easy to operate, easy to understand, and yet does its work so perfect that your crops are increased 25 per cent to 50 per cent. :: :

A "**Perfection**" cleans, separates and grades anything from Corn to Red-Top.

Write us today and we will tell you what it will do as well as show you how it does it. Be sure and tell us the kind of grain you raise.

Kansas City Hay Press Co., 129 Mill Street, Kansas City, Mo.

successful help from the horticultural and biological division. Pomologists are constantly traveling in fruit-raising localities, advising fruit-growers and farmers generally as to fruit-growing and demonstrating by practical methods and experiments the best ways to be successful. A number of commercial orchards have been established on modern lines and numerous canning factories are springing up in various places throughout the colony. The American fruit-grower with his practical knowledge of horticulture would without doubt be successful in the Auckland district. I could see wonderful opportunities there for those who understand fruit-culture.

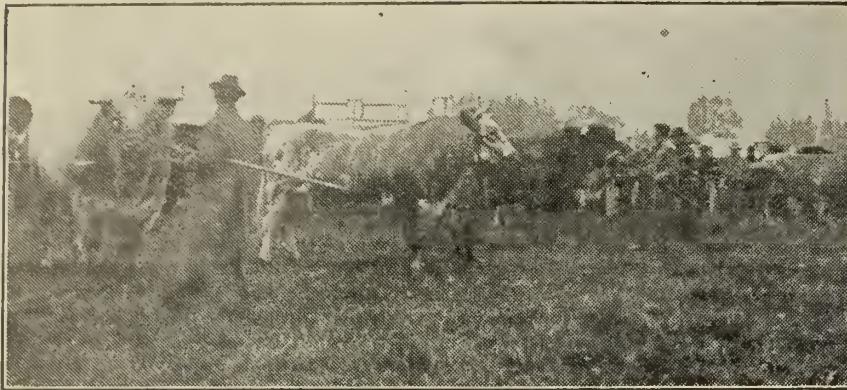

WHERE THEY RAISE GRAIN.

The grain belt of the colony is on the Canterbury plains in the middle island. The plains are 50 miles wide and 150

and they are usually through in January. The greater part of the shearing is done by hand, although clipping-machines are rapidly coming into use. The weight of the fleece runs from 6 to 11 pounds per sheep; and the shearers receive from \$3.75 to \$5.00 per 100 sheep and board.

COMPULSORY EDUCATION.

The laws of New Zealand are attracting world-wide attention. I had an opportunity to see them in their practical working and the effect they produced throughout the islands. The foundation of these laws and the faithful observance of them, I was told, could be seen in the homes of all the people, where the mother's love and her advice were the guiding star of New Zealand's present and future manhood. Example is much; it directs the youth to the straight and narrow path of

Judging Shorthorns, Hawker Bay Show, New Zealand.

long. This section is one of the greatest grain producers per acre in the world. The principal city on these plains is Christchurch, of 60,000 inhabitants, a modern city in every respect, with electric lights and gas, street-car lines, and very beautifully laid out. It has been selected as the city wherein the International Exhibition, beginning November, 1906, and lasting six months, will be held. New Zealanders take great pride in this forthcoming exhibition and claim they will surprise older worlds in the wealth of resources they will show. Foreign countries are very much interested in it, and space for exhibits has been taken by manufacturers in Great Britain, France, Germany, Russia, Norway, China, Japan, Canada, United States, Australia, and India.

The flax or hemp industry of the colony is very important. Flax grows mostly on swampy ground, although found on hill sides. It grows both in a wild and a cultivated state. It is sorted and graded under Government inspection. The exports for the year past were \$3,654,115 in value.

Kauri gum is also of great importance. This gum is found only in the north Island, under the surface of the earth where it has lain for years. It is used in the manufacture of varnish. Its export value amounts to about \$6,000,000 annually and ten thousand gum-diggers are constantly employed searching for it.

SHEEP THE LEADING INDUSTRY.

Sheep-raising is carried on more extensively in New Zealand than perhaps in any other country in the world. The large grazing farms are designated as "stations," and in New Zealand to have it said of a man that he owns a "station" means that he is a man of much wealth.

During the year 1905 there were 104 of these large station-owners, who owned more than 20,000 sheep each. The balance of the 20,000,000 sheep were owned by 18,390 persons, who possessed sheep from a few hundred to several thousand. The principal breeds are Lincoln, Romney, and Leicester, with a few Shropshires and Southdowns to breed lambs for the English market. There are only 70,000 merinos in the colony and no American merinos. There are scarcely any herders in an American sense, all the sheep are practically fenced in and they need no especial attention other than during lambing season. The sheep-herders receive from \$25 to \$35 per month and board, and a very easy time they have of it. The great bulk of the sheep are fed on English-cultivated grasses, and a large percentage are fattened on rape, turnips, mangels, etc. Scarcely any grain is fed them. August, September, and October are the months for lambing.

When I passed through the colony during the months of August and September last I saw hundreds of lambs from a few hours to a few weeks old, rotting beside their dams or lying contentedly on the green grass.

Shearing time begins in November,

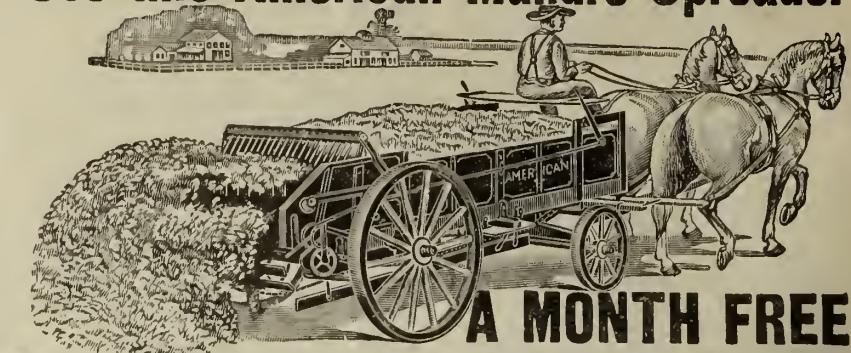

right, or to that broad road of years of wrong-doing. The New Zealand mother is educated; she is refined. Inheritance has done much for her but education has done more, and it is what is building up the nation and will supply its brains for all time to come. Illiteracy is not known among those born and raised in the colony. Compulsory education is a law, and all children are forced to obey it. Pupils must begin attending school at the age of seven and continue until the age of fourteen unless prior to that time they are able to pass the fourth grade. This fourth grade when passed is equivalent to being prepared for the high school in America. There is no way for children to avoid going to school if they are physically able to. Even their parents are not depended upon to keep them in school, but their absence is attended to by an officer whose duty it is to look after truants, and he does it most effectually. When you consider that most of the people of the colony attend these schools and many of them continue through New Zealand colleges equal to our own, it is no wonder that statistics show that there is less illiteracy in the islands on New Zealand than any other country in the world. No child can obtain employment in any store, factory, or other place, unless he or she has attained the age of fourteen years, and by teacher's certificate can show that he or she has passed the fourth-standard grade in school.

THE GOVERNMENT ASSISTS SETTLERS TO OWN A FARM.

The New Zealand government has several millions acres of land open for settlement, suitable for agricultural purposes. In order to get the right kind of people, English-speaking farmers, to occupy and develop these lands, the Government passed the Advance to Settlers Act. Under this law the Government sells lands to farmers from other countries and assists them by loaning them money equal to three-fifths of the amount they invest in the land. As an illustration, if an American farmer should go to New Zealand with the intention of living there and engaging in farming, they would sell him land suitable for farming purposes and, if he had \$5,000 to invest in lands, the Government would loan him three-fifths, or \$3,000, for improvement purposes, at five per cent interest per annum and on five years time. Of course, a larger or smaller amount would be loaned dependent upon the investment. The Government has loaned twenty-two millions of dollars in this way. The Premier told me that owing to the great prosperity of the country and the absolute surety of continuous good crops, the farmers soon pay off their loans.

The Government aids the settler in another way. The settler buys a parcel of wild bush land, as much as he can pay for at a few dollars per acre. The Government makes it a part of the contract that their deal must be reciprocal. He must work three days each

Use this American Manure Spreader

A MONTH FREE

TO PROVE ALL THE CLAIMS WE MAKE FOR IT

We sell direct to you because we do not belong to any Trust or Combination.

And by our plan of making and selling direct, you get a dollar's worth of Manure Spreader for every dollar you pay.

You see we make more Manure Spreaders than any other concern in the world.

We own and operate the largest factory ever built for this purpose.

It is equipped with every modern labor-saving device. All our machinery is up-to-date—the very "latest improved".

This means the best possible machines at the lowest possible cost.

The American Manure Spreader is today an example of the very highest development in modern agricultural implements.

It is absolutely up-to-date. The principles upon which it is constructed are sensible and practical.

There are no complicated parts to get out of order. It is simple, and carefully constructed.

And you take as much time as you require to pay for the Spreader after you have used it **A MONTH FREE**.

The Spreader may earn its own cost, before you send us a shilling.

Will you be as fair with us as we are willing to be with you?

Will you send for information of our generous proposition today?

Even though you do not wish to buy now, send for particulars.

Some day you may wish to buy, and then knowledge of our New Selling Plan will come in handy. You will know how to save money.

If you will tell us how much land you own, and how many horses, cattle, sheep and hogs you keep, we will give you the Government statistics as to the value of your manure crop.

Write to us today. Put down this paper and write before the matter has a chance to slip your memory.

AMERICAN HARROW CO. 10133 Hastings St. Detroit, Mich.

Copyright, 1906, by Dodd & Struthers.

Seventy-five per cent of the damage done to farm buildings is caused by lightning, but not a loss where our rods are used.

Our rods protect you because they are made of pure copper, are put on in a continuous strand; no joints nor weak spots, and all our agents are taught by us how they should be erected.

Teaching these agents keeps thirty-four traveling men busy, but it pays, for it enables us to give an absolute guarantee with every job.

When we teach a man how to erect our rods we give him an Agents Certificate which says that he is competent to rod your house and authorize him to issue our Written Guarantee.

Make the agent show you his certificate and see that our trade mark is burned on the end of the spool, for when it comes to protection from lightning you want the best and not a cheap imitation.

Write for our free booklet, "The Laws and Nature of Lightning and How to Control It."

Yours very truly,

week clearing his land, and the other three days he must work for the Government on the public roads in the vicinity. For the work done for the Government he receives \$2 a day, if a single man. In this way he helps make good roads, these roads enhance the value of his lands, and he gets sufficient cash each week to keep him in provisions. If a man of family he gets \$2.50 and gets his pay every Saturday night. This law is doing a wonderful good in the colony. It is converting wild lands into prosperous farms, building good roads, and enabling settlers to own good farms within a few years after they reach the colony.

LAND FOR SETTLEMENT.

The Government has open for settlement about 8,000,000 acres of land. It is desired that these lands be settled upon by English-speaking, practical farmers, men who will be a credit to the country and upbuild it as a nation. There are at this writing a trifle less than 1,000,000 people in New Zealand, of which about 40,000 are Maoris or natives. There is plenty of room for 4,000,000 people in the colony, but the newcomers should be agriculturists to engage in general or special farming, in sheep- and cattle-raising, in dairy-farming and in fruit-culture. The Government is extending the right hand of welcome to such people and offers them cooperation in good lands at low prices, low rates for the shipment of their products, the assistance of experimental farms, free-grading inspection, free service of breeding sires, etc., and lest the lands should be taken too quickly they impress an absentee tax on non-residents equal to double that paid by those living in the colony and can, by law, appraise and buy for subdivision and settlement such of the enormous "stations" or immense farms as are necessary to provide lands for incoming settlers at reasonable prices.

The tariff has been removed and all agricultural and farm implements and apparatus used for daily purposes are received free of duty from the United States, Great Britain, and Canada.

THE WEALTH OF THE COLONY.

The population of the Colony is slightly less than 1,000,000, and the average wealth is \$1,498 for each person, the highest in the world. The wealth and prosperity of the country is shown in savings deposits. At the end of the year 1905 there were 276,066 depositors in the Government savings banks and they had a total credit balance of \$43,331,338. When you stop to consider that in a country with less than 1,000,000 population almost one in every three has money on deposit in a bank, it shows how prosperous that country is.

New Zealand is rich in agriculture,

Christchurch are located at the verge of magnificent harbors. Christchurch is an inland city and Lyttelton, four miles distant, is its seaport. The cities are modern in every respect, have gas, electric lights, street-cars, colleges, large and expensive public buildings, etc.

LAWS PREVENT STRIKES.

There are many laws in New Zealand which add to the welfare of the people. The Conciliation and Arbitration Act absolutely prevents strikes. The Old Age Pension Act cares for men and women in their declining years. What is known as the Free Breakfast Table lessens the cost of living by removing the tariff on many of the necessities of life. The Government assists the worker to build and own his home. The Government has a penny postage. It owns and controls the telegraph and telephone systems and makes very low rates. It owns the railroads and carries passengers and freight at rates satisfactory to the general public. It is a Government representing all the people that they may prosper and be thoroughly contented and happy, with their cost of living reduced to the lowest possible degree.

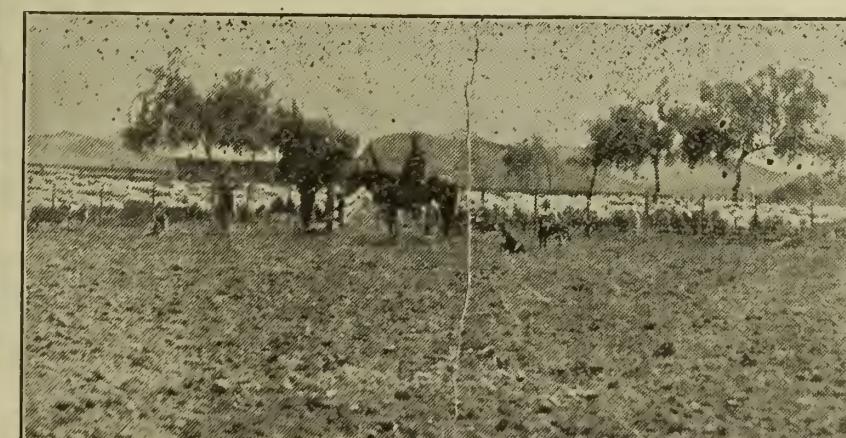

ALL PEOPLE ARE HEALTHY.

Living in a land where nature has showered so many blessings, where torrid heat and blizzards are unknown, where the climate is always tempered by ocean winds, it is not surprising that New Zealand has the lowest death rate of any country in the world. The people virtually live out of doors and I never saw so many healthy and rosy-cheeked little ones as I saw in New Zealand, barefooted in the middle of their winter, which was very much like our October weather.

THE CHARACTER OF THE PEOPLE.

New Zealand is populated with an English-speaking class, industrious, progressive, and educated. The people are courteous and hospitable. They admire Americans. They like the hustle which is found necessary for an existence in this country, and when I asked many of them if they would like to have farmers from the United States come and settle among them, they, without exception, paid the highest compliments to our farmers, and said they would gladly welcome them as neighbors and friends in a land where the climate is always mild, where strikes are not permitted, where drought and failure of crops are unknown.

The Kirlin Disc cultivators advertised on page 436 of this issue of THE KANSAS FARMER, are Kansas machines made by a Kansas man. Mr. Kirlin lived many years in Kansas and knows her needs and the conditions un-

A Few Ewes and Lambs, New Zealand.

and its temperate climate enables stock to forage on green vegetation through the year. Enormous crops are raised of wheat, oats, barley, turnips, and mangels. The values of exports during the past year were: Wool, \$26,900,965, gold (about) \$10,000,000, hemp, \$3,654,015, and butter over \$8,000,000. About 3,500,000 carcasses of frozen mutton and lamb are shipped annually. There are fully 20,000,000 sheep grazing on the islands at the present time. There seems to be a scarcity of herdsmen or shepherds and young men are in demand at all times. There is a special demand for men who understand milking and looking after cattle and a general knowledge of farming; such men can always find profitable employment.

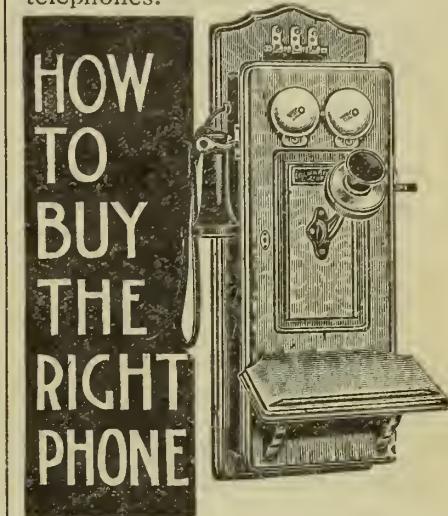

THE CITIES OF NEW ZEALAND.

Auckland is the largest city with 67,000 inhabitants, Christchurch second with 60,000, and Wellington and Dunedin have more than 50,000 each. There are many other very prosperous cities ranging from 5,000 to 10,000. The larger cities with the exception of

which farming is practiced here. With this thorough knowledge and with a large experience and inventive skill, he has been able to place before the farmers of the West one of the most perfect machines yet offered them. In these latter days when it is so difficult to secure farm help, the farmer must depend upon machinery to do his work. The new catalogues lately issued by Mr. Kirlin shows many styles of disc cultivators and lists equipped with the new magazine dust-proof disc-hub and the open disc for cultivating corn the second time when desired. Twelve years of use in the field is the best possible guarantee of the value of this line of farm tools. They are just the tools needed for preparing wheat ground, the cultivation of corn or other sown crops, and the killing of weeds. Write to Mr. Kirlin, 1208 Union Avenue, Kansas City, Mo., and you will get one of these catalogues free if you mention THE KANSAS FARMER.

Every Tuesday, balance of the year, the Chicago Great Western Railway will sell homeseekers' tickets to Minnesota, North Dakota, and Canadian Northwest at about half rate; to other territory first and third Tuesdays. Write G. W. Lincoln, G. P. A., 7 West 9th St., Kansas City, Mo. State number in party and when going.

C Every farmer knows the value of a farm telephone, but he is not in a position to know which is the best phone to buy. It's a good deal like buying a watch. The outward appearance of all telephones are very similar. But how about the works inside? That's the part you want to know all about before you buy. We have published a book about telephones.

C It tells "How to Buy the Right Phone." This book tells the reasons why the "EACO" phones have clearer, stronger talking qualities than others. It tells why "EACO" phones are better adapted to the use of farmer's than others. It tells how to organize a Farmer's Telephone Company and how to build a practical efficient working line that will be a source of pleasure and profit every day in the year.

C "EACO" phones are the favorite farmer's telephone because they are made handsome, strong and durable. Subscribers can be called up whether the receiver is on the hook or not, provided all the phones are fitted with our X. P. Condensers. "EACO" farm phones are especially made for heavy work on crowded lines and aside from being substantially made, are low in price. Get our book mentioned above and read how to start and build a farm line. Telephones are a necessity to every farmer, and every live farmer is getting in line as fast as possible. Write today.

Better Barn Roofing

There is no building around your premises that requires a better roofing than your barn. On the quality of its roof depends the protection of your stock, grain, feed, machinery, etc., which is of vital interest to you. One leak during a heavy rain is liable to cause more damage than a new roof of BEACON-ITE would cost.

When you put a new roofing on your barn, why not use a material that will not leak? BEACON-ITE LONG LIFE ROOFING is made of materials that make it absolutely water-tight. Isn't this the kind of roofing you want for all of your buildings, one that you will not have to patch after every rain?

About the cost: BEACON-ITE is the only roofing you can buy direct from the mills; thereby saving the dealers' profit. We pay all the freight charges.

Write to-day for FREE samples of this water proof roofing and our wholesale prices. Then judge for yourself.

Treatment of Lousy Live Stock.

R. A. CRAIG, VETERINARIAN PURDUE UNIVERSITY EXPERIMENT STATION.

Farm stock that become badly infested with lice during the winter months do not thrive as they should, and in the spring may show marked unthriftness. This is especially true when stock are not well cared for and in young animals.

The sucking lice are more harmful than the biting varieties, as the former have mouth parts adapted to penetrating the skin and sucking the blood of the host. However, the symptoms may be as marked in sheep and other animals, that are badly infested with biting lice. In such cases the wool or coat becomes matted and detached, and the skin irritated and inflamed as a result of the animals rubbing, biting, and scratching the parts.

Good care during the winter will prevent the lice from doing a great deal of harm, and the simpler remedies, such as mercurial and sulfur ointment rubbed back of the horns or ears and along the mane and back, and insect powder dusted into the coat, may help in destroying them. A thorough treatment of the herd with dips or washes can not be practiced during the winter months unless the treated animals are prevented from catching cold. A favorable time to use this line of treatment is in the spring. A one or two per cent water solution of a tar disinfectant should be used. A convenient way to apply the remedy in the larger animals is with a spray pump, and in sheep and hogs by dipping. Whatever method is used, the coat and skin must be thoroughly wet with the solution. Proper care should be taken in mixing the remedy, as there is danger of making it too strong and irritating the skin.

After treating the herd, the stables, sheds, or sleeping quarters should be sprayed with about a two per cent water solution of the disinfectant, or whitewash may be used instead. This is necessary in order to prevent re-infesting the herd from the surroundings. If there is much litter around the yards and it can not be gotten rid of, it is advisable to move the herd to other yards. Tar disinfectants in one or two per cent solutions do not destroy the eggs or nits, hence, it is necessary to treat the animal again in ten days or two weeks.

Stockmen sometimes ask if the feeding of sulfur to lousy animals will not drive away or destroy the lice. The feeding of small doses of sulfur will do no harm, neither will it help in getting rid of the lice, and it can not be con-

ZENOLOUM VETERINARY ADVISER FREE.

A copy of this interesting and well-printed booklet, containing sixty-four pages of valuable advice, prepared by the leading veterinarians in the world for live stock owners and printed at a great expense by the Zenner Disinfectant Company, 61 Lafayette Ave., Detroit, Mich., will be sent to you upon request, absolutely free of all cost. This booklet is intensely interesting and you should have a copy. Do not wait a minute. Write for it now.

sidered a remedy for this class of disorders when used in this way. Sulfur is effective, however, when used externally, and the addition of four ounces to every gallon of the tar-disinfectant solution used, greatly increases the effectiveness of the remedy.

The Southeastern Sale.

The Southeastern Kansas Improved Stock-Breeders' Association sale of Shorthorn cattle at Fredonia April 13, was one of the most successful sales held in the State for two or more years. A notable feature of the sale breeders of Kansas, Missouri, and Oklahoma, who expressed themselves pleased with the high quality of the offering and proved their expressions sincere by their spirited bidding throughout the entire sale. The top price of the offering was for the Scotch Missie bull, Captain Archer, bred by S. C. Hanna, of Howard, Kans., and sold to J. F. Stodder, Burden, Kans., at \$610. Great results may be expected from the use of this great red and great breeding bull in Mr. Stodder's good Silver Creek herd. The top-priced female was Emma Tillycrairn, a Scotch Emma with a heifer calf at foot by Captain Archer, also from the Hanna herd and selling to H. M. Hill, of Lafontaine, Kans., at \$550. The attractions of Mr. Hill's good offering were the good heifers by his Marr Missie bull, Imp. Mariner. Two of the best of these sold to Mr. Hanna at \$200 each, much less than their real value, but Mr. Hill expressed himself as much pleased that so good a breeder as Mr. Hanna should think them good enough to add to his great herd. The top of Mr. Hill's consignment was Choice Goods and going to head the choice herd that V. L. Polson is establishing at Fredonia. The entire offering went to buyers as follows:

1. J. F. Stodder, Burden.....	\$610
2. Benj. Levering, Benton.....	195
3. W. W. Dunham, Fredonia.....	140
4. A. L. Barner, Belle Plaine.....	175
5. H. M. Hill, Lafontaine.....	350

36. W. Thompson, Silver Belle, Arizona.....	105
37. W. C. Cummings, Heston.....	150
38. J. P. Newell.....	70

Thirteen bulls sold for \$2,145, an average of \$165 each. Twenty-five cows and heifers sold for \$3,515, an average of \$140.60. Thirty-eight head sold for \$5,660, or an average of \$148.90.

The Ashcraft Sale.

The draft sale of Shorthorns from the herd of A. M. Ashcraft, Atchison, Kans., was fairly well attended by local breeders and farmers and a few outside breeders were on hand. The cattle were in fair condition and did not sell quite as high as was expected by Mr. Ashcraft, but the general expression of breeders in attendance was that the values received were about as high as those at most sales where no animals of pure Scotch lineage or show-yard reputation were included.

The number of young bull calves in the offering served to reduce the average considerably.

Among the buyers were T. M. Ramsey, Farmington; W. M. Oswell, Atchison; John Volk, Farmington; L. B. Allen, Cummings; Glancy Bros., Atchison; John Carroll, Easton; Henry Buttram, Lancaster; Bert Barber, Atchison; John Wynkoop, Doniphan; Wm. Chapple, Troy; James Leland, Cummings; Leon Calhoun, Potter; Peter Begley, Potter; Wm. Donley, Potter; R. Mayers, Easton; Isaac Lawler, Potter; J. E. Reckliff, Troy; Thos. Kline, Cummings; J. E. Sullivan, Ellington; Guy Bell, Atchison; Lewis Bell, Nortonville.

Allen's Sale of Good, Well-Bred Short-horns.

When a class of cattle, rich in both breeding and individual merit, such as will be offered at public auction, at South Omaha, May 1, by Mr. Geo. Allen, of Lexington, Neb., the publisher is glad to print their merits and call attention to them. No offering of Shorthorns so richly bred along Scotch lines of breeding has been sent into a sale-ring in the West for a long time, if ever, as Mr. Allen is consigning to his sale and every animal but two listed for his sale was bred by him and they are all good ones. Of the 22 young cows and heifers in his sale, all are pure or straight Scotch breeding but three head, and of the 19 head of bulls all but four are clean Scotch. Most of the others are of pure Bates blood, such as Grand Duchess, Dukes of Oxford, etc., of which there are none better. In cataloguing his cattle for this sale, Mr. Allen has gone farther than most any one else in that he gives the breeders names of the dams as well as of the sires, so that one can tell if they are Scotch on both sides of their ancestry. At least two-thirds or more of the cattle listed for this sale are by the pure Cruickshank bull, Godwin 115676, bred by Col. W. A. Harris, and used by him on his herd until sold to Mr. Allen. He is a twin brother to the noted bull, Godoy, the

sire of many good Shorthorns in this country, yet his days of usefulness are over, while Godwin is doing valuable service in Mr. Allen's herd at the ripe old age of 13 years. Godwin is a son of the renowned Imp. Spartan Hero and Imp. Golden Thistle, by the great Sittyon sire, Roan Gauntlet. Bred to a number of the eligible daughters of Godwin is No. 3 of the sale catalogue, Serepta Duke 238508, a very handsome roan 3-year-old, a show bull of great merit, with lots of size and quality and the half dozen or more calves that will be sold by the side of their dams are all red and show up to the credit of Serepta Duke as a splendid breeder. Any one wanting a show and breeding bull of pure Scotch breeding will do well to look after this animal, said by good judges to be the best individual since the days of Young Abbotburn. Send for sale catalogue, mention this paper, and come to the sale.

The Lincoln Importing Horse Co.

A. L. Sullivan, manager of the Lincoln Importing Horse Co., Lincoln, Neb., sends in copy for a change in his advertising. Look it over. It is good reading. Mr. Sullivan writes: We are having a good trade and are shipping a number of good horses into Kansas. We now have on hand a number of thoroughly acclimated Percheron, Belgian, English Shire, and German Coach stallions, and nobody in the United States can undersell us on first-class stallions. Prospective buyers can not afford to purchase until they examine our stallions."

EDITOR KANSAS FARMER:—Rosenbaum Bros. & Co., of the Union Stock Yards, Chicago, offer the specials herein enumerated annually to be competed for at the International Live Stock Exposition for the purpose of supplementing the efforts of the exposition as an exponent of the advancement of our recognized present-day celebrities in the production of the animal form by adding to the prizes that have hitherto been offered by the exposition, the breeding associations, and other public-spirited individuals.

They propose to offer to the breeders and feeders in the different States an additional incentive to add further lustre to their achievements by bringing about a competition between State breeders. The specials are as follows:

To the State which sends to the International animals that win:

The greatest number of points, \$500.

Second greatest number of points, \$300.

Third greatest number of points, \$200.

These winnings are then to be turned over to the animal husbandry department of the agricultural college of the State winning, as an appreciation of the improved work that is being accomplished by the agricultural colleges in the education of farmers' sons in the science and practice of field tillage, the growing and care of crops, and the science of breeding and art of feeding, directing the experiment stations receiving the money to use it in paying prizes on live stock or to successful students in judging live stock and grains, or to both, at the winter meetings known as the "Farmers' Short Course in Agriculture" at the different agricultural colleges.

The details governing the disposition of the premiums are to be arranged by the dean and the professor of animal industry and the professor of agriculture at the college located in the successful State.

W. E. SKINNER, Gen. Mgr., Chicago, Ill. Union Stock Yards.

More Fame for McLaughlin Bros.

McLaughlin Bros., Columbus, Kansas City, and St. Paul, have added a new feather to their cap. In a recent letter they write: "During the Horse Show at Paris, the French Government officials wanted two of the best Percherons exhibited. They needed these horses for their most important stations in the Perche. On account of the fact that we had purchased the best stallions in France, they were compelled to come to us. In the 3-year-old-stallion class, horses purchased by us a long time prior to the show, won first, second, third, fourth, fifth, and sixth prizes. We sold the French Government the fourth prize stallion, 'Coco,' and the sixth prize stallion, 'Luce,' for a price higher than the Government ever paid anybody for two Percheron stallions. The French Government was placed in the same position as the buyers in America—they wanted the best stallions and were compelled to come to us."

The following letter explains itself.

"Republic of France.
Minister of Agriculture, Department of the Government Stud.
Paris, June 28, 1905.

"Mr. McLaughlin:—I wish to thank you very much for your kindness in permitting us to purchase for the Government Stud, two of your excellent Percherons. We have very great need of them for the stations in Perche, where it is necessary for us to have good reproducers.

"I pray you to accept, dear sir, my best regards.

"Director of the Government Stud,
"HORNEZ."

Gossip About Stock.

Kansas has 158,591 sheep and only 170,807 dogs. Kansas dogs are very profitable.

The last quarterly report issued by Secretary F. D. Coburn, of the State Board of Agriculture, gives all of the papers and discussions had at the last annual meeting and is mighty good reading.

Dr. O. L. Kerr, Independence, Mo., still has a few choice O. I. C. boars closely related to Kerr Dick, Big Mary, and his other famous World's Fair winners that will please purchasers wanting something of the most approved type and breeding in the popular O. I. C.s.

M. C. Vansell, of Muscaton, Kans., one of the oldest Shorthorn breeders in the State, is offering for immediate sale a pure Scotch bull which will please a most exacting purchaser wanting an all red bull for light service this

The Hog for Profit

is the Hess fed hog. The pig that gets a proper tonic to aid digestion and help every organ to do its proper work, puts on the fat the quickest and easiest. Dr. Hess Stock Food is such a tonic; there is nothing like it to give "tone," vigor, and easy keeping qualities to all kinds of live stock, and to cure and prevent disease.

DR HESS STOCK FOOD

gives healthy digestion and assimilation, so that the least food is wasted—every grain of corn and drop of milk makes pork. It is the prescription of Dr. Hess (M.D., D.V.S.), containing tonics for the digestion, iron for the blood, nitrates to expel poisonous materials from the system, laxatives to regulate the bowels. It has the recommendation of the Veterinary Colleges, the Farm Papers, is recognized as a medicinal tonic and laxative by our own Government, and is sold on a written guarantee.

5¢ per lb. in 100 lb. sacks; Except in Canada and extreme West and South. 25 lb. pail \$1.60. A tablespoonful per day for the average hog. Less than a penny a day for horse, cow or steer. If your dealer cannot supply you, we will.

KANSAS FARMER
Fifteen Months for \$1.00
Thirteen Weeks **FREE**

season. He is good enough to be in the reckoning in the strongest of the junior yearling classes this fall, and his breeding is excellent. Mr. Vansell is also selling Barred Plymouth Rock eggs from his choice flock at 75 cents for 15. Note advertisement and see or write Mr. Vansell.

John Bollin writes that he can still spare a few yearling sows bred to Nemo L's Duke, for May and June farrow, and some good summer and fall boars, some especially nice ones by the World's Fair winner, The Picket. Note the advertisement of Mr. Bollin and see or write to him.

E. E. Axline, the well-known breeder of Poland-Chinas at Oak Grove, Mo., reports a splendid egg trade, having sold recently a single order of 1,000 eggs. Mr. Axline's flock of Plymouth Rocks is of the same high quality as his herd of Poland-Chinas. He also has a few fall pigs of either sex with which he can supply his customers.

J. R. Roberts, the oldest Poland-China breeder in the Cherokee Strip, is one of the very few to report good luck with his early litters. Mr. Roberts' new herd boar, R's Grand Chief, the highest priced herd boar sold in Oklahoma, is siring phenomenally large litters, the first numbering 16 and the second 10. Prolificness is characteristic of Mr. Roberts' herd. He is making a special offer of late summer boars and desires to correspond with any one in need of Poland-Chinas of either sex.

The three days' sale at Kansas City, April 3, 4, and 5, under the management of W. C. McGavock, of Aberdeen-Angus and Hereford cattle was fairly attended, but prices ruled a little low on the female portion of the offering each day of the sale. The bulls, especially those of good quality and good serviceable ages, sold much higher than the females. The first day 63 Aberdeen-Angus, 17 bulls and 46 cows and heifers, were sold, the bulls at an average of \$97.20 and the females at an average of \$73.80. The average of the entire lot was \$80.60. Miss C. N. List, of Syracuse, Neb., topped the sale in the purchase of No. 3, a good Erica cow with a calf at foot at \$325. Miss List was a bidder on the good things throughout the sale, buying several good ones. Two other ladies were buyers. Miss Mary Best, of Medicine Lodge, and Miss McCreary, of Highland, buying one each. R. S. Williams, of Liberty, Mo., was possibly the heaviest buyer. Other buyers were Geo. Kitchen Jr., Gower, Mo.; H. R. Clay & Son, Pleasant Hill, Mo.; E. R. Wilhoit, Holt, Mo.; Chas. E. Sutton, Lawrence, Kans.; G. W. Switzer, Harrisonville, Mo.; J. W. Fishback, Kansas City, Mo.; Armour & Co., Kansas City, Mo.; M. W. Harding, Humboldt, Neb.; A. C. Mellette, Galena, Mo.; A. Laughlin, King City, Mo.; W. R. Kinmore, Highland, Kans.; W. M. England, Dallas, Mo.; J. Chambers, Bedford, Iowa; L. H. How, Humboldt, Neb. The Herefords, sold the 3d and 4th, averaged \$101 on 92 head, 34 bulls averaging \$118.80, and 58 females \$90. The top price for one animal was secured for a splendid bull calf just a little over a year old from the herd of Jas. Paul, Patch Grove, Wis., selling to W. A. Hurt, of Booneville, Mo., at \$460. Other buyers were: Klaus Bros., Bendena, Kans.; I. H. Roberts, Lancaster, Mo.; Samuel Drybread, Elk City, Kans.; Jas. Funkhouser, Plattburg, Mo.; J. McKensie, Kansas City, Mo.; M. W. Brabb, Alta Vista, Kans.; J. E. Summers, Sifton Hill, Mo.; C. W. Armour, Kansas City, Vista, Kans.; J. E. Summers, Clifton, F. Davis, Odessa, Mo.; W. H. Holt, Liberty, Mo.; W. A. Hurt, Booneville, Mo.; E. C. Lilly & Son, Piedmont, Kans.; T. P. Whitenburg, Pleasant Hill, Mo.; Geo. S. Smith, Craig, Neb.; Robt. Nelson, Morgan, Wyo.; E. E. Davidson, Randolph, Mo.; J. H. Lathrop, Washington, Ia.; R. P. Henry, Pleasant Hill, Mo.; F. W. Sheely, Durant, Ia.; John Gosling, Kansas City, Mo.; D. D. Rees, Penora, Ia.; Fred Sutton, Concordia, Kans.; Jos. Oab, Topeka, Kans.; Sweezy & Hurt, Booneville, Mo.; H. D. Henson, Williamsburg, Mo.

Cheep Summer Rates to California. The transcontinental lines always have made reductions in the round-trip rate to California for a few days each summer on account of some big National gathering. Not until this year were such low rates authorized for the entire summer. This new departure was adopted in order to stimulate travel to California, and thereby induce Americans to see their own country first, instead of going abroad.

Beginning June 1, and until the middle of September, first-class tickets will be sold to the principal California points at \$75 from Chicago, \$69 from St. Louis, \$60 from Kansas City, and proportionately from the East generally. These tickets will be limited for return until October 31.

The Santa Fe also announces that the summer rate to the Grand Canyon of Arizona and return, also to Phoenix and return, will be \$5 less than the above figures.

Tickets sold at rates named will be honored on the California Limited.

During the last week in April and the first week in May, also during the last week in June and the first week in July, the Santa Fe will make a rate of about one fare to California and back, account Mystic Shriners' convention at Los Angeles and N. E. A. convention at San Francisco. Several special excursions will be run from Chicago by way of the Grand Canyon.

The Wyatt Manufacturing Company. The Wyatt Manufacturing Company, of Salina, Kans., who make the famous Jawhawk stackers and rakes, and who were advertisers with THE KANSAS FARMER last year, start their advertising again with this issue. F. Wyatt, the proprietor of this business, came to Salina about three years ago. He realized the difficulty farmers meet in securing competent help to care for their crops of hay, and his invention of the well-known Jawhawk stacker has been one of the important factors in overcoming this great obstacle. No one knows better than the farmer what it means to secure help during hay har-

Save Money on Oil

We Sell Premium Machine Oil at Less Than Half the Price You Now Pay.

Our Premium Machine Oil is sold at \$3.50 per barrel. Thousands are using it and find it all right.

Every barrel guaranteed, and you be the judge. Other oil costs 35c to 40c per gal.; ours costs \$3.50 per barrel. Freight rate is 32c per barrel all points within 100 miles of Benedict, Kans. For each additional 25 miles add 2c.

After receiving and using 5 gal., if not satisfactory, return the balance, with bill of lading, and I will refund full price paid for said oil.

We Can Save You Money on Cylinder Oil. Write for Particulars.

T. C. Davis, Benedict, Kansas

Poland-China Bred Sow Sale

at Clay Center, Kansas, April 28, 1906

Instead of April 21, as appears in W. Breeders Journal.

40 sows bred to Expansion or sons of Expansion; some aged sows to farrow about May 1. Others are yearlings and gilts, to farrow in May and June. They are medium to large in type, are smooth and plenty of quality; not overfat, but a good, useful lot of the Expansion kind. Drop us a card and we will mail you free breeding register for your herd and history of the P. C. breed, with sale list.

H. C. Dawson & Sons, Endicott, Nebraska

PARKE, DAVIS & COMPANY.

DETROIT, MICHIGAN, U. S. A.
BRANCHES: New York, Chicago, St. Louis, Boston, Baltimore, New Orleans, Kansas City, Indianapolis, Minneapolis, Memphis, U. S. A.; Walkerville, Ont.; Montreal, Que.

vest. It comes at a time when every man who can or who is willing to work is employed and when the demand for help is greater than the supply, and at a time when a few days' delay may be the means of ruining the crop. With this machine the farmer can not only go ahead without delay, but can save 50 per cent of his labor bill. He can build a stack any size or shape and it will keep better than when stacked by hand. It is simple in construction, easy to move about, and any one can operate it. It has only been a few years since straw was all stacked by hand, and to get the help to do it was one of the serious problems of thrashing time, but in a short time see how the wind stacker has revolutionized the entire business, and to-day one man does the work and does it better than it was formerly done with four or five hands. So it is with the Jawhawk stacker. It does the work of three or four men and does it better and faster and without delay. In a year a farmer can save the cost of one to say nothing of the convenience of owning it. The price is within the reach of all, and it will pay you to read the advertisement and send to the firm for their prices. Mention THE KANSAS FARMER and write them.

How to Buy a Farm Phone.

One of the handsomest little books that has lately come to THE KANSAS FARMER office is one issued by the Electric Appliance Co., Chicago, Ill., bearing the title "How to Buy a Farm Phone." Not only does it tell all that its title indicates, but it is filled to the covers with information about how to organize a rural telephone line, how to build and operate it, how to make repairs, how to secure a franchise, how to make a subscribers' contract, and a lot of other valuable information that is difficult to obtain in so condensed a form from any other source. We have arranged with the Electric Appliance Co., of Chicago, to send one of these handsome little books free to each of our readers who will write for it and mention THE KANSAS FARMER in the letter.

Passengers east from Chicago to Fort Wayne, Findlay, Fostoria, Cleveland, Erie, Buffalo, New York City, Boston, and all points east, will consult their interests and find advantage in selecting the Nickel Plate road east from Chicago. Three through trains are run daily, with through day-coaches to New York City, and modern Pullman sleeping-cars to destination. Rates always the lowest, and no excess fares are charged on any train, for any part of the journey. Modern dining-car service, with individual club meals, ranging in price from 35 cents to One Dollar; also meals à la carte. Ask for tickets via the Nickel Plate Road, Chicago depot, La Salle and Van Buren Streets, the only station in Chicago on the Elevated Loop. Chicago City Ticket Office, 111 Adams Street. Detailed information may be secured by addressing John Y. Calahan, General Agent No. 113 Adams St., Room 298, Chicago.

"Hast thou an enemy? Make him thy friend. So hast thou gained a double conquest, for thou hast conquered both thyself and him."

Unusual opportunity for men without capital to become independent for life. Valuable book and full particulars free. Write today EDWIN R. MARDEN, Pres. Nat'l Cooperative Realty Co., 1166 Athenaeum Bldg., Chicago

Your Life Current.

The power that gives you life and motion is the nerve force, or nerve fluid, located in the nerve cells of the brain, and sent out through the nerves to the various organs.

If you are tired, nervous, irritable, cannot sleep; have headache, feel stuffy, dull and melancholy, or have neuralgia, rheumatism, backache, periodical pains, indigestion, dyspepsia, stomach trouble, or the kidneys and liver are inactive, your life-current is weak.

Power-producing fuel is needed; something to increase nerve energy—strengthen the nerves.

Dr. Miles' Restorative Nervine is the fuel you need. It feeds the nerves, produces nerve force, and restores vitality.

"When I began taking Dr. Miles' Restorative Nervine and Anti-Pain Pills I was confined to my bed. I had severe nervous spells, the result of two years illness with malaria. I gradually grew so weak that I was unable to sit up. The spells would commence with cold chills, and I would become weak and almost helpless. My circulation was poor. I had doctor'd right along but grew weaker and weaker. The Nervine seemed to strengthen me right away and my circulation was better. I have taken in all seven bottles of the Nervine, and I am entirely well."

ROSA E. WEAVER, Stuart, Ia.

Dr. Miles' Nervine is sold by your druggist, who will guarantee that the first bottle will benefit. If it fails, he will refund your money.

Miles Medical Co., Elkhart, Ind.

CONDUCTED BY RUTH COWGILL.

Ships That Never Came Back.

JOHN C. BAIRD.

I freighted a ship with Hopes and Dreams,
And trimmed the sails with prayer,
And hoisted the anchor to the decks,
On a morning bright and fair,
And she glided away in proud array,
On a gleaming jasper sea,
But in all the years of waiting and tears,
She never came back to me.

I freighted a ship with the Greed of Gold,
And set it afloat again,
And victualled it well, and barbed her decks

With guns and valiant men;
As she left the shore, the breakers roar,
A requiem seemed to be,
For in weary days, to my yearning gaze,
She never came back to me.

I freighted a ship with Fame's Desire,
And gave her the wings of steel,
And sent her away on a stormy day
With an anguished heart's appeal.
Then struggles began with my fellow man

Whose cargo the ships should be,
But she quelled the brawl for never at all
Did the ship come back to me.

Then I sailed a ship all laden down
With Love for my fellow man,
And all of her cost from my ledger I crossed
Ere the voyage of the ship began.

But never a ship that left the slip
Made such a voyage as she,
For a thousand weight of her previous freight
Came sailing back to me.

Housecleaning.

The time is approaching when the industrious housewife will begin her annual or semi-annual war upon dirt—the time when the "soap is on the stairs and the carpets on the line"—and a few suggestions upon the subject of arranging or rearranging the house might be opportune. The masculine side of the house is prone to ridicule the women for changing the places of furniture and pictures and for wanting to make things look different. They call it fickleness. They do not realize the necessity for a change or understand why things look so much better to her and seem so much more convenient, even if presently placed back in the same places they occupied a few months before. Human nature wearis of sameness. The Maker of all things realized this when He called into existence this varied and beautiful world. The wife sees the same things continually. Most wives seldom leave the home.

It is the demand of nature calling for a change and not fickleness of nature. I would advise such to make as much of a change as possible, even changing the furniture from one room to another. It can be done to advantage. It will be almost as good as a change of climate.

Housecleaning need not be made obnoxious to any one, and may be done with comparative ease. The habit of tearing up the whole house at a time and making life miserable for a week at a time is out of fashion and unnecessary. It is no wonder that it is looked upon with dread by all the inmates of the home. Housecleaning should begin early. March is a good time doing only one room a week. Begin with the top floor and work down, cleaning the attic or store room first, and before you know it the task is over and the men folks have hardly found it out. The appearance of the walls of the home is very important and they are so easily and cheaply tinted with alabastine (this is not an advertisement) that there is no excuse for their not being pretty. The white, hard finish is desirable from a sanitary point of view, but is tiresome to the eye and does not furnish a good background for pictures and it will not remain clean long. The tinted walls should harmonize with the other furnishings of a room. The walls of a room should be lighter than the floor-covering and darker than the ceiling and the general hue of wall and ceiling should be the same. The drop-ceiling effect is pretty, using a picture moulding at any distance from the ceiling that is desired, but for low rooms all horizontal lines should be avoided as they tend to lower the apparent height. Pictures break the monotony of the walls and beautify the home greatly. They need not be expensive, but care should be taken in their selection. Copies of fine pictures may be purchased for a small sum and are a good investment. The hanging of the pictures is important and their position and the light and the general effect need to be studied.

For the floors nothing is cleaner or

more sanitary than bare floors with rugs. The floor may be hard wood and oiled or varnished and waxed, or simply painted and left without covering for a foot or more from the baseboard. Matting is a cool, clean, and cheap floor-covering and it comes in pretty styles. To have an attractive home one does not have to be a millionaire, but what is needed more than that is good taste and the ability to arrange things to look cozy and homelike.

Tested Recipes.

Fruit Salad.—Three oranges, 3 bananas, 2 bunches of white grapes, $\frac{1}{2}$ can pineapple, 1 cup English walnuts; sweeten to taste; 1 box gelatine dissolved in cold water, then add 1 pint of boiling water; let it partly cool then pour over fruit. Sometimes I use jello in place of the gelatine.—Mrs. E. C. Nordstrom, Lyons.

Raisin Puffs.—1 tablespoon butter, 2 tablespoons sugar, 1 egg, $\frac{1}{2}$ cup milk, 1 cup flour, $\frac{1}{4}$ cup raisins, 1 teaspoon baking powder. Seed and chop the raisins, beat the butter, sugar, and eggs together until very light, add the milk and raisins, sift in the flour, and then the baking powder; beat until smooth and turn into small greased custard cups, having them $\frac{3}{4}$ full; steam from thirty to forty minutes. Turn out and serve hot with hard sauce.—Katharine Lawrence, Philadelphia, Pa.

Angel Food.—Whites 11 eggs, 1 tumbler sugar, 1 tumbler flour well sifted, mix well with sugar and gently fold into eggs never stirring. Flavoring to suit taste, and use baking powder if preferred.—Mrs. S. S. Hockett, Gage, Okla.

Philadelphia Butter Pie.—Cover a pie plate with crust as for custard pie, a piece of butter the size of an egg 2-3 cup sugar, 1 cup sweet cream—or rich milk will do with little more butter added, 1 tablespoon flour. Stir butter, flour and sugar together, then stir in the cream, pour in the plate and bake till brown.—Mrs. Sarah A. Morse, Sterling.

Cocoanut Cookies.—1 cup cocoanut, 1 $\frac{1}{2}$ cups sugar, $\frac{1}{4}$ cup butter, $\frac{1}{2}$ cup milk, 2 eggs, 1 large teaspoon baking powder, $\frac{1}{2}$ teaspoon vanilla, flour enough to roll out.—Mrs. Sarah A. Morse, Sterling.

Chocolate Pudding.—1 quart milk heated to boiling point, beat 3 eggs, 2-3 cup sugar and 2 tablespoons cornstarch or flour. At the same time you put the milk on to heat, put into it nearly 1 cup of grated chocolate, more or less just as you like. Just as the milk is about to boil, stir in your eggs, sugar and cornstarch. Cook about ten or fifteen minutes.—Mrs. Sarah A. Morse, Sterling.

To Purify the Blood, Eat Raisins.

A very agreeable little fad, that will have good results if it becomes epidemic, is the eating of raisins as a purifier of blood. The prescription calls for one-quarter of a pound of the best table raisins, eaten daily and slowly masticated, without swallowing the skin or the seeds. Raisins, old sailors and old miners will tell you, ward off disease and are also curative. Policemen who are obliged to add to their weight quickly in preparation for civil service examination will also testify to their value in adding to one's avoidance.

Young women afflicted with skin trouble will also find a cure in raisins, if, during the time they have their daily quarter of a pound, they adhere to a simple diet.

She Is the Same Woman Still.

Nobody of any consequence in these days would be willing to risk his reputation by denying that Woman has made within the last century, and is still making wondrous advancement along many lines of intellectual development.

We behold evidences of her progress everywhere. She carries off first prizes in the great universities. She occupies conspicuous places in the learned professions. Beginning as a writer of silly novels for the entertainment of very young people, she has become a writer of great works that challenge the best productions of the masculine mind.

Where there was only one Elizabeth three hundred years ago, one Mme. De Staël a hundred and fifty years ago, one

For Breakfast Luncheon or Tea

A few small biscuits easily made with Royal Baking Powder. Make them small—as small round as a napkin ring. Mix and bake just before the meal. Serve hot.

Nothing better for a light dessert than these little hot biscuits with butter and honey, marmalade or jam.

You must use Royal Baking Powder to get them right.

ROYAL BAKING POWDER CO., NEW YORK

George Elliot fifty years ago, there are hundreds, nay, thousands, of women now who can hold their own against man in counsel, conversation, or literature.

And yet—and yet—astonishing as it may seem, paradoxical as it may seem—the new woman, with all of her intellectuality, independence of thought, force of character, is the same woman still, in many charming respects.

She is just as much afraid of a mouse as she was in the darkest period of the middle ages. Even when she attends a literary night at the Business Woman's club, as she did on Friday evening last, and a mouse scratches behind the wainscoting, while her mind is supposed to be wrapped in a lecture on Scotland's greatest poet, she pulls her skirts about her and jumps on a chair, as her material ancestors did hundreds of years before business women's clubs were invented.

Would we—that is, would men—have it otherwise? Well, we should say not!—Chicago Inter Ocean.

Household Notes.

A piece of charcoal put into the pot with boiling onions will absorb most of the odors.

Lemons can be kept almost indefinitely under glass that is light and air-tight. Set one under a goblet and see.

To wash anything that is greasy use hot soda water. The alkali turns the grease into soap, which will do its own cleaning.

A cup of chopped celery, if added to almost any stuffing for fowls, will improve it.

Macaroni, being easily digested and very nutritious, forms a welcome addition to the sick-room menu. For the invalid it can be added to a custard and delicately baked or boiled in salted water till tender and serve with cream and sugar.

Try washing the hands with a little sugar added to the soap. This greatly increases the lather and cleansing power, and will remove dirt, chemical stains, etc.

A pinch of sugar added to finely made mustard not only makes it much more tasty, but keeps it fresh much longer.

Celery, when eaten freely, produces alkaline blood, and where this exists there is neither gout, rheumatism, nor nervous prostration to any extent. When cooked it is more healthful than when eaten raw.

Washing day is justly dreaded in the heat of summer, when all work is a double burden to the flesh. Anything that lightens the work is therefore especially welcome, but though the tools of to-day are superior to those of our grandmother's, modern invention has done comparatively little to lighten the labors of the laundry. In spite of the cost of washing machines and the representations of their agents, a perforated zinc rubbing board is still the most useful tool that a good laundress can command.

"A Kalamazoo Direct to You"

You save from 20% to 40% by buying a Kalamazoo Stove or Range direct from the factory at lowest factory prices. Moreover, you get a stove or range not excelled by any in the world. We guarantee quality under a \$20,000 bank bond.

The Young Folks

The Oracle.

I lay upon the summer grass,
A gold-haired sunny child came by,
And looked at me as loth to pass,
With questions in her lingering eye.

She stopped and wavered; then drew
near;
(Ah, the pale gold around her head!)
And o'er my shoulders stooped to peer—
"Why do you read?" she said.

"I read a poet of old time
Who sang through all his living
hours,
Beauty of earth—the streams, the flowers,
The stars more lovely than his rime.

"And now I read him since men go
Forgetful of these sweetest things;
Since he and I love brooks that flow,
And dawns, and bees, and flash of wings."

She stared at me with laughing look,
Then clasped her hands upon my
knees
"How strange to read them in a book!
I could have told you all of these!"
Arthur Davison Ficke, in Harper's.

Fleetfoot: The Autobiography of a Pony.

CHAPTER V.—MARCELLA.

Mr. Dearcot looked from one to another of his willing helpers, and with a frown settling on his good-natured face began a tirade of self-abuse.

"There is something wrong with the way I manage things, and with all my methods," he announced as he propped open a shed door which the wind immediately slammed shut again, almost entrapping his silken hat in the process. The men made merry over the mishap and while assisting him to secure the riotous door cautioned him against future disapproval of his manner of conducting affairs.

The lawyer, however, wanted to have his say. "It's just this way," he continued, "I love the farm for my own sake and for the children's and because I believe it is the only place to get the best that life holds. Then, on the other hand, after spending the better part of my years learning a profession, I can't very well give it up to do something I know nothing about. Some say I make a good lawyer; everyone knows I'm a Simple Simon in agricultural matters. If I sell my land and move to the city, there is nothing ahead but noise and smoke and endless traffic with no avenue of escape. If I continue to farm, in other words, if I continue to run you fellows into the ground, there will be no satisfaction for any of us."

"With all your conscientious efforts there will be losses and confusion, for even if you are a large force it is impossible to stretch over everything. And now, my good men, what are we going to do? My place is here to direct and oversee things, but being found wanting we will have to manage some other way. Does anyone know that way?"

Mr. Dearcot had been nervously whittling a stick, and upon looking up for his answer was surprised to find that he had but one listener besides myself and that was Joe, the individual whom I had kicked, but I was now trying to "make good" with friendly overtures. As he fondled my inquisitive little face he glanced smilingly at the unhappy combination of lawyer and farmer.

"You're all right, Mr. Dearcot," he remarked cheerfully, "and please don't make so much ado about nothing. Stick close to your profession, for they say you are without an equal in your special line. You'll have no trouble picking up a good farm-manager and then we will all get on beautifully. And another thing, don't waste any pity on us fellows; we like our work; if we did not, all your lads wouldn't have deserted you in the middle of your fine plea, just for the purpose of feeding the horses and milking the cows."

"Well, surely enough they are all gone, even Lyall," exclaimed Mr. Dearcot with a relieved look.

"And by the way, Joe," he went on, "I'd rather have your bright way of seeing things than all the gifts in the catalogue. Difficulties will straighten themselves out some way if we only can summon faith and patience to our aid, but very few of us are philosophers enough to try."

Just then Lyall came 'round the corner, carefully carrying his dinner pail which was flowing over with warm frothy milk. All the tear-stains had disappeared from his face and for the first time I noticed what a pretty boy he was. He smiled sweetly as he said: "Papa will you and Joe please push the little colt into the shed, I want to give him his supper before it gets cold."

Guided by gentle hands, and follow-

ing the tempting bucket of milk, I reached the comfortable room which was to be mine for all time. The walls were whitewashed and the floor was covered thickly with fragrant hay. Through a slatted partition I could see a long row of horses enjoying their evening meal, and not far from me standing before a manger piled high with food was that dear, old rogue, Big Jake. With many loving pats, Lyall left me after I had drank all the milk in the pail, and then I lay down feeling happier and more contented than ever I did in my life before. Soon the soft patter of rain-drops on the roof lulled me to sleep.

The next morning I was awakened by the sun burning down upon my back. Thoroughly rested I stood up and the first thing I noticed when I shook the particles of hay from my coat was a red ribbon dangling before my eyes. It seemed that while I slept some one had braided my fore-lock, meager as it was, and tied it with a dainty bow. In another moment I heard a merry laugh, and looking in the direction from whence it came I spied a perfect fairy of a little girl. She was plump, rosy-cheeked, blue-eyed and wore long, golden curls. Reaching up she encircled my neck with her small, white arms. "Poor, little darling," she said pityingly. "You'll have a hard time, but I dess I can pull you frue."

CHAPTER VI.—TIME PASSES.

Little Marcella Dearcot did not shirk the duty she had taken upon herself, that of "pulling me through." With watchful tenderness she cared for my every want, bringing me past ungainly infancy into sturdy childhood and from thence to the border-land of the fully-grown. This last state was reached when I was about two years of age, and though my beauty was commented on by all, a bitter disappointment rankled in my heart.

From the time I was able to use my reasoning powers I had dreamed of the days in the future when I should be a match for Big Jake. He was my ideal of a perfect horse, and I hoped to look so much like him that we would be known as "the match team" as were Mr. Dearcot's beautiful drivers; only, I had planned that we should do none but heavy work, such as hauling gigantic logs and great powerful machines. Then my heart would thrill with happiness as I saw myself doing more than my share in order to spare Big Jake; going up hills, I intended to pull far ahead, thus relieving Jake of the strain. In this way he could grow old gracefully and not become gaunt and hollow-eyed as I had seen other venerable horses do.

But my ambitions, like nearly all earthly dreams, came to naught; yet when the first shock of my dwarfhood was over, I lost no time in vain repinings, for what was the use in making myself and others miserable because I was not what I never was intended to be? And I have always been glad since then that I knew how to be contented with my lot. I think, also, that I have given more happiness by being just a pony than I would if I had been a mammoth horse. It seems there are only too many who are willing to do the great parts, but it is the little things that really make the world go round.

Until my second birthday I spent most of the time in the big park at the back of the barn, cropping grass and standing under the shade of the trees which grew in shapely clusters by the creek's side.

Of course, I did not live out in the open when the weather was severe and the fierce winds blew; it is only the poor animals who have no one to care for them which do that. I had a warm stable and a soft bed, and better still the company of Big Jake. At times he would come in, and without passing any compliments would eat a portion of my bed and calmly put out of sight all the corn-cobs he could find. On his way back to his own stall he sometimes stopped and sniffed with amused tolerance at my miniature harness which hung upon dainty pegs.

Oh! you are surprised that I have a set of harness at the early age of two years. It is nothing to be wondered at for the children, Lyall and Marcella, harnessed me when I was but a few months old. They were too careful of me to drive me fast or ride me then, fearing, as they said, that I would become wind-broken or "sway-backed." I don't mind being broken single and double, but I consider the "wind-break" a bad method. Then again no driver can make any progress when his horse is always swaying back, the motion should be forward.

I was more than pleased when I was old enough to be hitched up, for until that time I had no opportunity of go-

LOWELL INGRAIN CARPETS

"The all wool kind"

We have been telling you for weeks WHY you ought to insist upon getting a LOWELL INGRAIN the all wool kind—when you buy a carpet. Thousands have taken our advice and are highly pleased.

ISN'T IT TIME FOR YOU TO CONSIDER BUYING

Remember these points: Cover the whole floor—it's warmer, and easier to take care of; can be used on both sides, a great saving. LOWELL INGRAINS are made that way; can be had in newest styles and colors, just like high grade carpets. If it is wound on a hollow stick, it's a genuine LOWELL INGRAIN.

When you buy carpets, ask the local dealer for LOWELL INGRAINS. Look for the hollow stick and run no risk. Don't accept any other.

TOPEKA BUSINESS COLLEGE, Topeka, Kans.

ing into society. It was not until then, either, that I became fully acquainted with my own family. This interesting circle consisted of Mr. Dearcot, before mentioned, and charming Mrs. Dearcot, who besides having a great deal to look after in her own household, was constantly being called upon by admiring visitors, who either wanted advice, or knew some one who really needed advice; sometimes, also, there was a demand for such substantials as clothes, food, or money.

Next in order was Lyall and Marcella, my special benefactors, and last, but by no means least in my regard, was Baby Doris, a few weeks older than myself.

Besides these dear ones there were several rosy-cheeked, light-hearted girls who helped Mrs. Dearcot about the house and when they had nothing else to do gave me cookies and apples, and once in awhile drove me on a visit to their friends.

So you see, everything considered, we were a happy community, each one contented and doing his best.

Out in the barn-yard, although the different varieties of stock never could be reconciled to each other's rights, I noted with pleasure how perfect was the harmony among the human brotherhood. And this, in my opinion, was as it should be, for what would the reasoning power and noble, upright bearing of a man avail him if he saw fit to put himself on a social level with us, who are burdened with four feet?

No matter how late the men came in from work nor how tired they were, the horses never received a kick or blow. Often from my safe view-point in the park I trembled for blundering Big Jake, who made his way to the watering trough or to his stall regardless of who or what stood in his way; but somehow allowances were made and the dear old fellow went unpunished.

Mr. Dearcot seemed prosperous on the whole, but there were times when he would come in from the city pale and worn; it appeared that on such occasions no explanations were necessary for the faithful "home people" understood.

So the miracle of seasons came and went, each telling its story of the wisdom and kindness of the Great Master. Thus four years of my life passed away, but I did not regret them for they were happy, well-spent years.

The Little Ones

A Spring Alring.
All the good little kittens have washed
their mittens,
And hung them up to dry;
They're gray and fluffy, and soft and
muffy.
But it's time to lay them by;
And now that we've come to the spring
of the year,
They have them all out airing here;
And that is the reason, I do suppose,
Why this little tree that every one
knows,
By the name of Pussy Willow goes.
—Martha Burr Banks, in Good House-
keeping.

Once Upon a Time.
MRS. A. D. GRAY.

"I should guess there would be time for some more 'bout that farm, and those truly children," said Malcolm, climbing into my lap.

"Mary said in fifteen minutes dinner would be ready. Seems like when little boys have been out a 'bobbing' with their sleds for hours and hours, that fifteen minutes would be most long enough for them to get starved," and he sighed deeply.

"Oh, no! Little boys can go for days without a single thing to eat," I said.

"Fifteen minutes isn't anything. It won't hurt them in the least."

"It makes them feel all hollow like a cistern, anyway," said Malcolm. "But g'wan, muver; maybe I won't feel if I am starving."

"There is one think about that big, big farm that will surprise you. These four children, who lived there, didn't have a hydrant at the kitchen sink—to turn on the water—didn't have a well, either."

"Oh my, muver; how thirsty they must have been. Did they have to go down to the river, ever single time they wanted a drink?"

"No, they had something that little city boys know very little about. They had a beautiful spring down in their meadow. It was like a deep, deep well, and the purest, coldest water bubbled into it all the while from the hill. The grandfather had the sides lined with stone and a high stone wall built on three sides. Over the top was a large stone slab to keep out the dirt and leaves.

"It was ten feet deep, and it never went dry, but was a famous spring for

Miscellaneous Program.

KANSAS DAY.

Roll call—Quotations from Kansas writers.

- I. Kansas as a territory.
- II. Kansas as a State.
- III. Resources of Kansas.
- IV. Noted Kansas women.

I. The history of Kansas is most interesting reading especially to Kansans and, although this program would have been particularly appropriate for Kansas day—the birthday of the State—nevertheless it is a good subject at any time. To be a good citizen one should be familiar with the history of his own State. I am glad the history of Kansas has been made a text book in our schools. A great deal was crowded into the first 17 years of Kansas while it was a territory and history was made rapidly. They were decisive years and had much to do in shaping its future. If the paper under this topic were prefaced with a brief outline of its history previous to its becoming a territory, it would add to the interest and perhaps make it more comprehensive.

II. The first few years following the admission of Kansas into Statehood were full of peril and pathos. They included those dark days of the civil war—Quantrell's raid and internal wars. Afterwards time and attention were devoted to the building of the State interrupted only by some Indian wars and drouth and grasshopper raids. These two papers should cover a brief but complete history of Kansas.

III. Time and energy have proven that Kansas is not only a corn State, but that its resources are numerous and still undeveloped. It is surprising to one who has not investigated the subject to learn of the great number of natural products.

IV. The history of Kansas can not be written without writing of the noted men and it will not be necessary to include the men in this subject as they will be included in other papers. Kansas has her noted women—noted for their courage, wisdom, common sense—who were a power for good in the State, and a short sketch of some of them will be interesting.

The Madison Taka Embroidery Club.

Under the auspices of the Taka Embroidery club a birthday party was given Mrs. A. Hind on the evening of the 26th. Games of different kinds with cards were played, among them the game of five-hundred, under the kind management of Mrs. Austin Wash-

burn. The game of five-hundred was played by twelve, at three different tables, as a progressive game. Mrs. Filler and Mr. Washburn received first prizes; Miss Pearl Filler and Mr. A. Hind received the booby prizes. After the games were finished, refreshments were served by waiters dressed in pink with green paper caps and aprons, the club colors. The favor with each plate was a pink carnation, the club flower.

The woman whose voice is always controlled, who is gentle and moderate even in moments of great stress, who knows how to express a contrary opinion without giving offense or displaying personal animus, is the strongest woman in any club. I care not whether she holds office or not. At a woman's club the members, regardless of their social position outside, are all standing on exactly the same plane.

STATE ORGANIZER.

W. J. Brynham.....Overbrook

Shawnee County Auburn Grange No. 499.

Editor Grange Department:—It is a pleasure to me to be able to report favorably in regard to Auburn Grange. It is in a very flourishing condition.

We have received by initiation since March 30, 1905, twenty-four members, almost doubling our membership during the year giving us a total of fifty-two members.

We have changed our place of meeting from the schoolhouse, which we have occupied since our organization, to a beautiful and commodious hall which we have rented. This hall gives us much better facilities for our ritualistic work, making the beautiful ceremony much more impressive and satisfactory.

For the vexed question of how to make the grange interesting, we discuss the questions submitted by the National Grange, also farm topics interspersed with readings and recitations, and by this means make our grange meetings very interesting.

We have discussed the question of the removal of all internal revenue duties on alcohol denaturized and rendered unfit for use as a beverage, thus placing it within reach of all for industrial purposes, furnishing to all a cheap light- and heat-producing material, and to the farmer a ready market for corn and other farm products from which alcohol can be obtained. We have sent a petition to our Congressman, Hon. Charles Curtis, stating our action and desire in regard to this question now pending in Congress.

The attendance at our grange meetings is large, averaging about two-thirds of our total membership which is above the average attendance of all secret societies, and a feeling of harmony permeates the entire membership.

We are making arrangements to have a competitive display of farm products in the fall, including corn, cereals, vegetables, fruits, etc., and for the ladies, butter, bread, and flowers.

The members of our grange are availing themselves fully of the fire-insurance feature of our order.

GEO. LUNN, Master.

Equity Grange No. 1111, Anderson County.

The last meeting of Equity Grange, held in March, was very successful and one that will result in much good to the grange in this locality.

We initiated twenty-nine new members and voted on a number of new applications for the next meeting. There was a large attendance of the

membership of Equity Grange. A large representation from Diamond Grange, No. 575, located at Haskell in this county, was present, also a large representation from a new grange recently organized at Welda, Kansas. We flatter ourselves that the ritualistic work on this occasion was ably and impressively rendered, and that our new members went to their homes fully realizing the useful lessons taught in this beautiful ceremony. The evening's work and pleasure was closed by a grand grange feast for which the order is noted, and a good social time was enjoyed by all.

Before closing this note I must say that our deputy, Brother J. H. Smith, is devoting a great deal of time to grange work in Anderson County. He organized the grange at Welda and is at work in the organization of another one at Colony. MRS. LETTIE MYERS.

Wea Grange No. 445, Miami County.

Editor Grange Department:—Wea Grange, No. 445, held an interesting meeting Saturday, March 31. It was an all-day session. The morning was spent socially after which we all partook of a feast of fried fish that had been very artistically prepared by our lady members. After this a session of the grange was held.

The good-roads question was a subject that occupied a greater part of the time of this meeting. Those taking part in the discussion favored and urged the use of the King road-drag. Some very good ideas were suggested in regard to the selection of seed-corn.

Wea Grange was organized August 22, 1873, and has grown from a small membership until we now have about 90 members. Brother J. C. Lovett, who is a very enthusiastic patron, is our master. He is a charter member of our grange and an ardent supporter of our order. Sometimes I think us farmers fail to realize the benefits we as a class receive from the Grange in general and our local granges in particular. Many of the conveniences we enjoy have been brought about by farmers' organizations, and especially by the efforts of the grange. Whenever the farmers become lined up and united, something has to move, some social, business, or political change is wrought. No other organization enables us to so readily and intelligently get together in our demands.

Let us all appreciate more the work of our subordinate grange. Try to realize the influence it has in our community, consider the benefits of its social meetings, and the good we have derived from the lectures and addresses of eminent persons who have visited us and talked to us upon subjects of vital interest.

Let us be true and loyal patrons. Let us stand by our home grange, attend its meetings, get interested in the work. Let us love our order for what it has accomplished for us and assist it in accomplishing more. Let us ponder well the question of where we would be without the grange in this day and age of gigantic organizations.

Bucyrus, Kansas. C. E. Z.

Woman's Work.

An Open Letter to the Masters of Subordinate Granges in Kansas:

We, your committee on woman's work, desire to call your attention to page thirty-one of the Journal of proceedings of the Kansas State Grange held at Madison, Kansas, in December, 1905. During this meeting a standing committee on woman's work was appointed by the State Master, and it is the duty of the master of each subordinate grange in Kansas to appoint a local committee on woman's work to take an active interest in all matters for the public good in the community, such as public school-rooms and grounds, also in matters pertaining to temperance and questions involving good citizenship. It will also be the duty of these committees to devise means for social entertainment in our subordinate granges and decorations for grange halls, plan entertainments and programs, picnics, etc., so that grange day will be looked forward to with pleasure. Masters will please appoint these committees and report to this standing committee as soon as possible.

MRS. LETTIE A. MYERS,
Chairman, Welda, Kans.
MRS. ALICE M. MUNGER,
Manhattan, Kans.
MRS. EFFIE A. SCOTT,
Larned, Kans., Committee.

Granges Organized in Three Months.

The number of Granges organized and reorganized from January 1, 1906, to March 31, 1906, both inclusive, is as follows:

Organized.—California, 2; Connecticut, 1; Colorado, 2; Illinois, 1; Indiana, 2; Iowa, 1; Kansas, 4; Kentucky, 4;

STOP, WOMAN!

AND CONSIDER
THE ALL-
IMPORTANT PACT

That in addressing Mrs. Pinkham you are confiding your private ills to a woman—a woman whose experience with women's diseases covers a great many years.

Mrs. Pinkham is the daughter-in-law of Lydia E. Pinkham, and for many years under her direction, and since her decease, she has been advising sick women free of charge.

Many women suffer in silence and drift along from bad to worse, knowing full well that they ought to have immediate assistance, but a natural modesty impels them to shrink from exposing themselves to the questions and probable examinations of even their family physician. It is unnecessary. Without money or price you can consult a woman whose knowledge from actual experience is great.

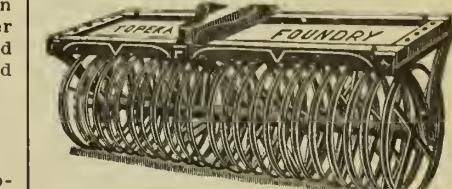

Mrs. Pinkham's Standing Invitation.

Women suffering from any form of female weakness are invited to promptly communicate with Mrs. Pinkham, at Lynn, Mass. All letters are received, opened, read and answered by women only. A woman can freely talk of her private illness to a woman; thus has been established the eternal confidence between Mrs. Pinkham and the women of America which has never been broken. Out of the vast volume of experience which she has to draw from, it is more than possible that she has gained the very knowledge that will help your case. She asks nothing in return except your good-will, and her advice has relieved thousands. Surely any woman, rich or poor, is very foolish if she does not take advantage of this generous offer of assistance.

If you are ill, don't hesitate to get a bottle of Lydia E. Pinkham's Vegetable Compound at once, and write Mrs. Pinkham, Lynn, Mass., for special advice.

When a medicine has been successful in restoring to health so many women, you cannot well say, without trying it, "I do not believe it will help me."

Agriculture

Pure-Bred Seed-Corn.

I would like your advice regarding seed-corn for this year's planting. Do you think it would pay me to buy pure-bred seed-corn to plant my whole field of about seventy acres, or would it be just as well to plant most of the field to common corn such as is grown around here and plant only a bushel of pure-bred corn so as to secure better seed for next year's planting? I shall have to buy most of my seed-corn this spring, as I saved only about two bushels of good ears.

I had thought of getting McAuley's White Dent corn. I want a corn that is not too late in maturing, as we have dry weather in the latter part of July sometimes, which might injure late corn worse than early. I am farming upland soil. Do you think it would be better to get seed grown on upland or would it be just as well to get seed grown on bottom-land?

Any information you may see fit to give me in regard to which variety of corn I had better plant and as to whether I should buy pure-bred seed or not will be gladly received.

Clay County. C. H. LONBERGER...

If you can get good home-grown seed-corn of some variety which produces well in your locality perhaps it may be advisable to plant your general crop with this kind of corn. In sending away for pure-bred corn you are not always sure whether the variety will be well adapted for growing in the new soil and climate. Seed-corn brought from another State or section of the State in which the climate and soil differ is apt not to produce as good crops the first season or two as the crop from home-grown seed of the same variety. It may usually be preferable, as you suggest, to secure only a bushel or two of pure-bred corn for planting the first season, and plant this corn in a field by itself, so that you can keep it pure. On the other hand, if some of your neighbors have already secured well-bred corn and have grown it for a few seasons, seed from such corn may be preferable to plant to planting other home-grown seed of corn which may be less pure in type. I do not advise to plant mixed corn.

McAuley's White Dent corn should succeed well in your section of the State, especially on upland. This is a hardy, vigorous-growing corn and a good producer. The McAuley's has ranked very high in the yield for the last two seasons compared with 80 other varieties tested at this station. Other varieties of white corn adapted for growing in your section of the State are the Hammett, grown by P. A. Hammett, Marysville, Kansas, also the Boone County White, and the Silvermine are good varieties of corn which have been introduced into Kansas from other States, but you should secure Kansas-grown seed if possible, especially if you plant this corn in large area.

For planting on upland I should prefer seed-corn grown on upland provided the corn is of good quality, fairly pure in type, and a variety well adapted for growing in that locality.

A. M. TENEYCK.

Cane As Green Manure.

Do you consider cane of any value as a green manure? JAS. R. PLUMB.

Lyon County.

We have never made any experiments at this station which give definite data as to the value of cane for green manuring, and I find no published record of the crop having been used experimentally for this purpose at other experiment stations. It would seem to me, however, that cane could be successfully used as a green manuring crop. My plan would be to sow late in the season, probably immediately after the wheat harvest. Last season we put a disk drill right behind the binder and when we had finished cutting the grain the field had been planted again to green manuring crops. In this trial we planted largely cow-peas, although some plots were planted with soy beans, sorghum, corn, Kafir-corn, rape, and small grain. Cow-peas made the best stand and the best growth last season. The sorghum did not make a good stand, but the growth was satisfactory when the crop was plowed under in the first part of September for green manure.

Perhaps the danger in using sorghum for green manuring will be that the sorghum may become too rank and too mature before it is plowed under. Also, it is not advisable to plow under sor-

ghum and plant to fall grains, rather plow early in the fall but plant to corn and cultivated crops the next season. This allows the sorghum to decay and the soil will settle and get into good seed-bed condition before planting to corn.

I refer you to a letter answering questions regarding the relative value of sorghum and cow-peas for green manuring published in THE KANSAS FARMER, October 19, 1905.

A. M. TENEYCK.

Experiments With Chemical Fertilizers at the Kansas Experiment Station.

EDITOR KANSAS FARMER:—During the past year there has been a great deal of inquiry from Kansas farmers regarding the use of chemical fertilizers. Some experiments have been carried on in the use of chemical fertilizers at this station during the past three seasons, with barley, oats, and corn, and experiments in fertilizing wheat were begun last fall. During the seasons of 1903 and 1904 trials were made only with nitrate of soda. In 1903 nitrate of soda applied at the rate of 200 pounds per acre at seeding time gave an increase in yield of barley of 4.8 bushels per acre, the yield from the fertilized plot being 20 bushels and from the unfertilized plot 16.2 bushels per acre, respectively. During the same season oats fertilized with 130 pounds of nitrate of soda per acre yielded 19.5 bushels, while the unfertilized plot gave a yield of 24.4 bushels per acre.

In 1904 nitrate of soda was applied to oats and barley at the rate of about 150 pounds per acre. As a result the fertilized barley yielded 35.2 bushels per acre and the unfertilized 17.7 bushels per acre, the yield of the fertilized crop being practically double that of the crop not fertilized. With oats the plot which was not fertilized yielded about 2 bushels more than the plot which received the fertilizer.

In 1905 nitrate of soda was applied to oats and barley at the rate of about 80 pounds of the salt per acre. During this season, also, we made experiments in the use of sulfate of potash and superphosphate fertilizers, these fertilizers being applied at the rate of 125 pounds per acre. In this experiment the barley which was fertilized with nitrate of soda yielded 59.9 bushels per acre, while the unfertilized check-plot gave a yield of 54.2 bushels per acre. The yield of grain from the plots fertilized with potash fertilizers and phosphate fertilizers was several bushels less than that received from the unfertilized plot. With oats the unfertilized plot gave the largest yield, the lowest yield being secured from the plot which was fertilized with sodium nitrate, namely, 32.6 bushels per acre. These experiments were carried on on land which was poor in fertility, being the upland soil of the station farm, which has received no manure for a number of years and which had been continuously cropped with corn and small grain. The land is very deficient in humus and nitrogen, thus there was a beneficial effect in the use of sodium nitrate, especially on barley, although the results were negative in the use of the fertilizer with oats, partly probably on account of the ranker growth of straw on the fertilized plots, which caused the oats to lodge worse than was the case on the unfertilized plots. These experiments with barley and oats are being continued in 1906.

Similar experiments have been conducted with corn during the past three seasons, as already described for barley and oats. No definite results were secured from the use of nitrate of soda on corn in 1903 and 1904. The results of the trial in 1905 were as follows:

Unfertilized corn yielded at the rate of 55 bushels per acre.

Corn fertilized with 100 pounds of nitrate of soda yielded 62.3 bushels per acre.

Corn fertilized with 250 pounds of superphosphate yielded 57.4 bushels per acre.

Corn fertilized with 200 pounds of sulfate of potash yielded 63.4 bushels per acre.

As a result of the single trial the use of the chemical fertilizers has given some increase in the yield of corn, barely sufficient, however, to pay for the fertilizer. These experiments in fertilizing corn are being repeated in 1906.

I do not, as a rule, recommend the use of chemical fertilizers in this State in the growing of wheat and corn and other standard farm-crops. Doubtless chemical fertilizers may be profitably used in the growing of special crops and in intensive farming, but Kansas lands are not yet so deficient in fertility but that by proper rotation of crops and the addition of barn-yard manure the soil may be maintained in good

cropping condition and continue to give large yields of corn and small grain. What our Kansas soil needs more than chemical fertilizers is rotation of crops. Too many farms have been cropped continuously with corn or wheat for too long a period, until the soil has become apparently exhausted in fertility and a change of crops in which grasses and alfalfa are rotated with corn and wheat and other small grains will again in part restore the fertility and improve the soil texture so that we may continue to produce large yields of grain without the use of chemical fertilizers.

A. M. TENEYCK.

The Importance of Sub-Packing.

Realizing the fact that few farmers comprehend the vital importance of the sub-surface packer, it certainly is not out of place in this number to devote considerable space to its merits.

In the first place, let us consider some of the practical demonstrations of the effect of packing the under portion of the furrow. The first experiment which really called my attention to sub-packing as the direct cause of increased yield was in 1883. In 1882 we had harvested the best crop of spring wheat I had ever seen in any section. This was in the northern part of South Dakota, the yield being more than 40 bushels per acre. The straw was long and stiff and the harvester was raised to the highest point in order that as little unnecessary straw as possible need be cut to handle.

In due time the field was cleared of the crop and the plowing done to a fair depth. On account of no rain that fall the soil was rather dry during the winter. Considerable snow fell, however, so that in the spring all of the plowed ground to the full depth of plowing was moist. Work of harrowing and seeding began as soon as the frost would permit. First, three horses were driven over the field attached to a harrow, second, two horses attached to a seeder, and third, three horses attached to the harrow the second time. Going over the field three times with these teams resulted in many hoof prints. Strange as it may seem, the only wheat that grew to any reasonable height and produced heads of grain was grown in these hoof prints where the weight of the horses had made the soil firm to the sub-soil below. In the remainder of the field the top soil was held up from the sub-soil by the long stubble that had been turned under the fall before.

Two years later we rented 160 acres and the seed was put in with an end-gate weeder, a device attached to the end-gate of a common farm wagon and driven by a sprocket wheel attached to the wagon wheel. In operating this one man drove the team and another man tended the machine, both riding. In addition to the weight of wagon and men there was also that of from four to six bushels of wheat carried. This total weight caused the wheels to firmly pack the soil to the bottom. Here again there was a marked illustration of the importance of sub-packing. The season being somewhat dry the stand of wheat in the field generally was thin and short, while in these wheel tracks it was at least a half taller, much thicker, and productive of a far better berry.

THE REASON WHY.

To clearly grasp the force or value of any scientific principle, it is necessary that we understand the reason why. The great difficulty we have to contend with in the growing of crops in the semi-arid sections is to be able to carry the crop through some prolonged dry period without damage to the crop. To add to the force of this let me say that many times during the early years of struggle for existence in North and South Dakota, I have heard men say that if rain had come one day sooner or two or three days or a week sooner their crops would have been saved.

In the face of the above facts it is apparent that we must do everything in our power to provide moisture in ample available quantities to carry these crops at least a few days longer than they would otherwise live.

The first step is to store ample moisture below the surface to supply the needs of the crop at any and all times. The next but equally vital step is to control this water, so far as it may be possible, by increasing the water-holding capacity of the soil and by increasing the power of capillary attraction and thus lifting the moisture as rapidly as possible from our storage house below up to the soil in which the main feeding roots of the plants carry on their active work of gathering the necessary plant elements. This is all brought about by thoroughly knitting

The Government of Canada

Gives absolutely FREE to every settler

160 Acres of Land in Western Canada

Land adjoining this can be purchased from railway and land companies at from \$6 to \$10 per acre.

On this land this year has been produced upwards of twenty-five bushels of wheat to the acre.

It is also the best of grazing land and for mixed farming it has no superior on the continent.

Splendid climate, low taxes, railroads convenient, schools and churches close at hand.

Write for "20th Century Canada" and low railway rates to Superintendent of Immigration, Ottawa, Can.; or to the following authorized Canadian Government Agent.

and firming the seed-bed and root-bed. In addition to controlling the moisture, this packing of the lower portion of the furrow slice also facilitates a more liberal growth of roots and rootlets and increases the available supply of nitrates and bacteria. All this providing the surface is kept loose to admit air and prevent the loss of moisture by evaporation. The packing of the lower portion of the furrow slice is not only important in increasing the yield of the crop you plant this year, but if the work is properly done even on quite sandy soil, it absolutely prevents the soil from blowing.

Some advantages of deep plowing and sub-packing, then, are these:

(1) It increases the water-holding capacity of the soil.

(2) It increases the upward movement of moisture by capillary attraction.

(3) It facilitates the development of available nitrates and bacteria.

(4) It makes it possible for the little hair rootlets or feeders of the main lateral roots to permeate this soil in every direction.

(5) With these four combined conditions and with water previously stored below, it is possible for the plant to resist the ill effects of any dry period common to the most arid sections.

(6) With the above five conditions present the farmer is assured of a very much larger crop than otherwise when proper cultivation is given, and finally the presence of these conditions and their results very greatly increases the profits of the farmer who carries out their provisions as outlined.—H. W. Campbell, in *The Scientific Farmer*.

Horticulture

Don't Make Garden in a Day.

J. C. Whitten, horticulturist of Missouri University, gives the following timely suggestions for garden-making:

"If the garden is planted all in a day, to get the disagreeable job out of the way, it is probable that only one or two species of plants will do their best. Some will have been planted too early and others too late.

"For best results in garden-making each kind of plant should be put out at the time when conditions are best suited to it. Lawn grass-seed, sweet peas, parsnips, onions, spinach, and some other species should be planted as soon as the soil can be worked in spring. Seeds of all these will germinate, and even make stronger growth, when the soil is only a few degrees above freezing. If it freezes more or less on cold nights after they are planted, no harm is usually done.

"Other plants like nasturtiums, candytuft, beets, potatoes, carrots, etc., have a larger heat requirement and should be planted in mid-spring, or at least later than the first mentioned list. They will not endure well if put out on the first days when the ground begins to thaw out, but they should be planted before the soil gets very warm.

"Corn, beans, melons, cucumbers, tomatoes, and many others require a warm soil and time will be gained if they are not planted until the soil is well warmed up to a considerable depth.

If put out too early, the seeds are liable to decay in the soil. Even if the plants do grow they will become stunted by the cold and will not develop into good plants. It saves time to plant these warmth-loving kinds after the soil is warm.

"Some species need a great deal of heat. These are lima beans, okra or gumbo, eggplants, and some others. They should be the last vegetables planted. Still other species should be planted at intervals so as to get a succession of vegetables for the table. Most kinds which grow quickly may be planted in succession. Radishes, beets, lettuce, peas, and many others are best only when they are tender and succulent. Seeds of these may be planted every three weeks for a time, so as to have them tender during the first half of the season.

"No date can be mentioned for planting the different sorts. Seasons differ. It may be warmer one year on the first of April than it is two weeks later another year. If one will watch the starting of leaves and flowers on early species of trees and shrubs, he can get an index as to the time to plant. To plant sweet peas when the willow catkins are coming out is a good rule and similar comparisons may be made for other plants. This is accurate for

SAVE ALL THE GRAIN YOU GROW!

Let Us Reason Together

BETWEEN seed time and harvest, the grain grower has to trust very largely "to luck."

Nature makes the crop in her own way.

But when harvest time comes he must "get busy."

His profits then depend upon the wisdom with which he harvests his grain.

The wise man begins to get ready weeks before the actual time of harvest.

He knows he can't "trust to luck" then, and he does not want to be caught unprepared.

The first thing he does is to make sure that he has the right facilities for harvesting—the right kind of machines for the proper cutting of his grain.

He wants to get every spoonful of grain that Nature has given him.

He wants to get it with

- the least delay in time;
- the least labor on his own part;
- the least hardship on his horses;
- the least likelihood of trouble and annoyance.

He cannot "trust to luck," and certainly he cannot trust to a poor harvesting machine, a worn-out harvesting machine or an *uncertain* harvesting machine.

How about *you* and your harvest?

If you are a businesslike farmer, you will get ready for harvest now.

Go to a dealer who handles any one of the International line of harvesting and haying machines.

Get a catalogue, look at the machines, study their construction, and you will *see for yourself* that they are built to meet every requirement.

In principle of operation—in design—they embody all that the most skilled mechanical experts have discovered in the past 50 years.

In materials they have lumber, steel and iron of the highest grade only—the selected products of the manufacturers' own mines and mills, produced for the purpose of harvesting machine building.

In workmanship, it is the product of the best facilities that money and experience can produce.

In everything that makes a machine reliable, trustworthy, durable and efficient, the

Champion
Deering
McCormick

Milwaukee
Osborne
Plano

Harvesting and Haying Machines, represent the highest grade of excellence.

These machines have been before the public for a long term of years—some of them for more than half a century. Other machines—scores and scores of them—have come and gone. These have remained, growing every year in popularity. Is the stamp of approval placed on a machine by the farmers of America and grain growers of the world worth anything?

Is it not certain that their popularity has been merited? Men do not buy machines year after year, unless the machines do satisfactory work.

To-day the standard harvesting and haying machines embraced in the International line, are better than ever before, because they are the products of riper, richer experience, more expert skill, and better and greater facilities for manufacture than were possible in the past.

The manufacturers of these several machines, by close co-operation, are able to own, control and operate their own coal mines, iron mines, lumber camps, coke ovens, steel mills and other sources of supply, producing their own materials, under their own supervision.

They get these materials when they want them, not being dependent upon uncertain and fluctuating markets; they get them of the right quality.

By co-operation they are enabled to employ the most expert skill in designing improvements and in the actual manufacture of the machines.

By co-operation they are enabled to employ extra facilities for the economical production of machines of the highest quality, facilities which are impossible for an individual manufacturer.

By co-operation they are enabled to surpass even their proud records of the past.

—If you expect to save *all* your grain;

—If you want a harvesting or haying machine on which you may depend with absolute certainty;

—If you want to be free from "break-downs," delays, and repair bills;

Take a little time, go and talk to an International Agent.

Inspect the machine he handles and get a catalogue.

It will pay you whether you buy this year or not.

If you don't know an International dealer—write to us for the name and address of one nearest you.

INTERNATIONAL SUNDAY SCHOOL LESSON.

John 2:1-46; Luke 7:11-17; 8:41, 49, 56.
Christ's Life: Lessons from His Resurrection Miracles.

It was part of the mission of Jesus to emphasize the reality, importance, and permanence of things spiritual, as opposed to things material. To this end some of his most impressive parables were spoken, as for example that concerning the man whose soul was required on the very day on which he

proposed to build larger barns in which to place his goods (Luke 12:13-21). Jesus' miracles in which the dead were restored to life are especially designed to emphasize the same truth. They do it most effectively. They amount to a demonstration. The reappearance of the spirit in the body after death proves beyond controversy the indestructible character of the spirit. The spirits so restored had evidently survived the incident of death. There are significant gradations in Jesus' miracles of raising the dead. He worked the miracle on the body of a little girl as it still lay upon the couch in her boudoir (Luke 8:41). He worked it upon the body of a young man as it

was being carried to the grave (Luke 7:2). He worked it upon the body of an adult which had been three days in the tomb (John 11). It has been commonly agreed that these miracles were wrought to prove Jesus' divinity. May it not rather be suggested that their chief design was to prove man's divinity. They are an object lesson. In a startling and irrefutable way they show the indestructible and imperishable quality of the human soul. Science, so long supposed to be in hopeless antagonism with religion at this point, has lately changed its note. The most recent and authoritative utterance discount the materialism which denies spirit in God or man.

Dairy Interests

The Profitable Dairy Cow.
PROF. C. S. PLUME, OHIO STATE UNIVERSITY.
(Continued from last week.)

CHANGES IN THE HERD.

As the months rolled by, it became clear to father and son that radical changes must be made in that herd. The cows showed an average for the herd at the end of the first year of only 180 pounds of butter-fat each, which at 25 cents a pound yielded a gross return of \$45.00. The feed and cost of keep ran up to \$40.00 each, so where was the profit? And the scales and Babcock showed that some of the cows were boarding at the expense of the Winslow family. It was interesting, for the fact is, these robber cows lacked dairy type. John discussed them with his father. There were six of them, and he showed them up in their true light. Pointing to one of them, she had made only 2,000 pounds of five per cent milk that year, he said, "Look at her beefy thighs and smooth meaty back. She hasn't any room between her thighs there for an udder anyway. The sooner we get rid of her the better off we'll be. Then take old Speckie. She never did have any belly, and her bag is all cut up in front so her fore teats are three inches above the others. She isn't a good feeder, and a poor feeder never made a good breeder or milker. Let's cut down the whole herd by throwing out these six. It's money in our pockets." Old man Winslow saw the wisdom of this proposition. He couldn't think of any argument quite equal to the facts produced by scale and Babcock test. Furthermore the arguments on cow-shape which John and Haecker presented were invincible. So the cows were sold.

You have heard the saying that "blood will tell," and that "every man has a right to be well born." Scientific men apply this to the beasts of the field as well as to the man who directs their destinies. The Winslow family had little surplus money. It was representative of many a hill family in worldly goods. Things must be accomplished gradually. But Mr. John Winslow had not forgotten his lessons of other days. He had studied pedigrees as a student. He had learned of famous cows and great sires. Had not thousands of purebred dairy cows records of 14 or more

So the hunt for a bull began, and it ended in the purchase of an animal of a style and quality that neighborhood had never seen before. He was a breeder, as had been his sire before him, and his calves showed constitution, style, and quality.

The second year the Winslow herd averaged 250 pounds of butter and things were generally improving. The old gentleman began to see more uniformity in the cows, in style and make-up. The calves he said were just like so many peas. They used to wonder what sort of milkers the heifers would develop into. Then began the study of calf-form, and caif-udders. It was seen that some of the calves had not only well-developed udders, extending out front and behind, but they also had the thin thighs so essential for room between. Those were good signs, thought John.

CLASSES OF DAIRY COWS.

In New England more than elsewhere in America, feeding stuffs are high in price, because in the main they are produced far away on the fertile lands of the West. The farmers bought prudently of grain, and many gave painstaking study to the relative cost of feed stuffs and their value in combinations. There were men about Rockdale who were intensely interested in what they fed their cows; but they had not reached the point of learning whether they were feeding profit-producing cows or not. Winslow senior always watched the grain bin, much as did his neighbors, but until his son brought new ideas to his attention, he had quite overlooked the significance of the individuality of the cow. The Minnesota experiments of Haecker had interested him greatly. Later on, Prof. Beach, of the Connecticut Agricultural College, published some experiments of the same kind, that he thought were even more telling than those of Haecker. Beach had 50 cows, which he divided into three groups. There were 35 classed as of the dairy type, which from the pictures resembled some in their own herd, which John said had the proper shape. Some others had shallow bodies and lacked belly and digestive capacity, while eight others were smooth and fleshy in type. These cows had credited to them 103 annual milking records, 80 of which were produced by those of the dairy type.

The results secured show clearly and decisively that the dairy type was the money maker. The little pamphlet which contained this report expressed it in figures this way:

Number cows.	Cost of food.	Yield butter fat, pounds	Profit.
Dairy type.	35	\$54.43	301
Shallow body type.	7	49.42	201
Fleshy type.	8	50.50	206
			\$28.09
			5.81
			6.09

pounds of butter-fat in seven days? Had not the descendants of Golden Lad, King of St. Lambert, Paul DeKo, Sarcistic Lad, American Champion, and others proven the unquestioned value of blood? They certainly had. "And blood, blue blood if you please, was wanted in the herd," said Mr. John Winslow to his father. Said the son: "Father, we have never had the influence of a good bull in our herd. We have the common-grade stock of our neighbors. It has brought us nothing of value. The calves are without merit, and the heifers are like the other poor ones of the community. We have gotten rid of six of the herd. Let's buy a young bull that we can use on the remaining cows, that will bring us something worth having. Let's buy a bull from a splendid pure-bred cow of dairy type, sired by a bull that has proved himself a breeder. Think what it means! Too many men think only of the cost of a bull in money. The value of a bull is measured down through future generations. The first calves have 50 per cent of his blood, and if he is a good breeder he should wonderfully tone up our herd and greatly add to our milk and butter record. This is simply the experience of the best breeders in history. We can use this sire on our herd and the stock of the neighbors for two or three years, and then sell him while he is vigorous and valuable, and then buy another not closely related to him to breed on the old cows and their daughters. Instead of buying a \$20.00 grade bull, let us seek a pure-bred one, that is a good individual and well bred, and pay the price. We ought to get a good one for our purpose for \$100, but let's get the right one anyway."

If you have a son, a partner of yours, who is earnest, business-like, industrious, and intelligent, you had better do as old man Winslow did, and let him take the lines in his hands. If you don't the chances are you will be sorry.

Young men of energy and brains, no matter what their business, want to know what the other fellow is doing and how he does it. This has a general application, irrespective of business. The farmer's institute grew out of this feeling. The Institute is an educational medium to help farmers. Under right conditions, it introduces new ideas into a community. Consequently, when the first institute was

held, it was a success.

John Winslow had a son, John Jr.,

who is a good example to all.

John Jr. is a good example to all.

held at Rockdale, the Winslows took a lively interest. They could not help it because the dairy cow was up for discussion. The principal speaker was a great dairy authority, who had two characteristics of a delightful sort. Next to telling a good story, he most enjoyed talking about the cow. He told some mighty truths, even if he did say that whenever he saw a cow he wanted to take his hat off to her as though she were a lady. John got some new inspiration from him, and came away surer than ever that he was working in the right direction.

Five years after John's return home the herd had come up to an average yield of 350 pounds of butter-fat, and the three-year-old heifers were beauties, for the bull first bought had proven a great breeder. He was sold for almost what he cost to a neighbor and then another of the same breed of somewhat different blood-lines took his place. He was of the same type and character, and thus they hoped to continue the uniform development of the herd. It gratified John not a little bit that a neighbor should want to own the old bull, for it meant that the gospel of good breeding was spreading in the community.

The health of their stock had been good ever since the new administration began. The lessons which he had learned from the college veterinary instructor had been helpful on occasions, and simply emphasized the useful character of his training during those four years. Milk-fever, the dread of all dairy-cattle men, had visited him but a little. His motto was, "An ounce of prevention is worth a pound of cure," so he fed cooling, laxative foods before and after calving, kept the cows clean and in healthy condition, and

then acted quickly if sickness occurred. Later on in his career, when he had many heavy milkers, he adopted the method of injecting sterilized air into the udder when milk-fever occurred and with highly-gratifying results.

As the herd grew in age and quality, the subject of future improvement was never lost sight of. Good dairy literature found its way onto the sitting-room tables, including both experiment station publications and dairy and live stock journals.

(To be continued.)

The Apiary**Transfer Bees to Modern Hive.**

EDITOR KANSAS FARMER:—Will you please tell me how to move a swarm of bees from an old hive into a new one? They were put in an old box two years ago, and I wish to take them out of this and place them in a new hive. Can any one tell me how to do it?

Lyon County. J. R. COOK.

In answer to the above inquiry will say that a movable-comb hive should be used as a new home for the bees in question.

Cut or split sticks one-fourth of an inch in diameter and long enough to reach one-quarter of an inch above and below the frames. Notch the ends of these splints and fasten them in pairs at one end with wire as far apart as the top bar of the frame is wide. Prepare 12 or 15 pairs of splints so as to have them in readiness for use when the combs are to be transferred from the old box hive. Wrap a cotton rag around the end of a stick, say 12 inches or more in length. Set fire to it and blow smoke from it into the hive where the bees now are in order to alarm them, and at the same time pound on the hive. The smoke and pounding will alarm them and they will in a few moments fill themselves with honey from their stores and will then not be cross. As soon as they have been thus treated, which will require not to exceed five minutes, turn the box or hive mouth upwards and place over it an empty box or nail-keg as a place to receive the bees as you drive them out. Wrap a cloth around the hive and box at the place where they come together, then with a hammer or club drum the old box for say 10 or 15 minutes and at the end of this time the principal part of the bees will have gone up into the keg or box placed above the mouth of the hive. Then gently set the box containing the bees on the old stand occupied by the old hive. Try off the side of the old hive and carefully cut out the combs, keeping a close outlook for the queen as she may not have gone out with the bulk of the bees. If found, put her in the box into which the bees have been driven. Lay a frame from the new hive on its side on a table or board. Cut and fit the combs into it. Save all the comb possible that contains brood or unhatched bees. Small pieces not larger than 2 or 3 inches square may be cut and fitted in the frames, side by side, until the entire box is filled. But, as a rule, there will not be many if any of these small pieces to look after as the combs will most likely be in larger pieces. I have often found one comb that would fill an entire frame. When a frame has been filled, as above outlined, slip one of the splints under the frame and the other one under the top, then fasten the splints securely at both ends. Put on as many pairs of splints as are required to hold the combs in position. Then lay the frame in the new hive. Pursue this course until all the comb has been transferred. I would, however, advise leaving out all drone combs or about so, as the presence of a large amount of drone comb causes many drones to be reared, and as they are not required in large numbers, the rearing of them should not be encouraged. When all the combs have been transferred to the new hive, place it on the old stand and hive the bees just as you would hive any other swarm. In one or two weeks the combs will be firmly fastened to the frames of the new hive, and the splints may be taken off. In case there is little or no honey in the combs that have been transferred, the bees should be fed a syrup of granulated sugar, made by dissolving ½ of a pint of sugar in ¼ of a pint of water. This syrup may be fed to them by setting the cup containing it over the frames and under the top cover of the hive. Now while the fruit-trees are in bloom is a good time to transfer bees.

Rice County G. BOURNE.

BUYING A CREAM SEPARATOR

Thousands of dairy farmers are buying a Cream Separator this spring. The purchase of a separator is a most important investment. Great care should be taken to make no mistake.

The Cream Separator is much different from any other farm machine. It either wastes or makes money twice every day in the year, and it may last from two to twenty years, according to the make of machine.

There is a big difference between the DE LAVAL and other Cream Separators, notwithstanding much the same claims are made for all "on paper," and some of the biggest claims for the poorest and trashiest machines.

DE LAVAL machines skim cleanest, have the biggest capacities, do the best work under every-day use conditions, produce the best cream and make the best butter, so that there is easily a difference of from \$50—to \$150—per year between the benefits and savings of a DE LAVAL machine and a poor one.

Then DE LAVAL machines are made up of much the best material and workmanship and last at least twenty years, with small cost for repairs, while other machines last only from two to ten years and cost a great deal meanwhile.

If the buyer wishes to be guided by the best authority and the best experience of others he must purchase a DE LAVAL machine, and he can surely make no mistake in doing so.

98 per cent of the creameries of the world, which have been using Cream Separators for twenty-five years, now use DE LAVAL machines. Almost every prominent dairy user does so. 700,000 farmers scattered all over the world, or more than ten times all others combined, do so. Every important Exposition for twenty-five years, ending with St. Louis in 1904, has granted the Highest Honors to the DE LAVAL machines.

DE LAVAL machines prove their own superiority. There are agents in every locality whose business it is to supply machines in this way and who are glad of the opportunity to do so. They set them and start the user right, which means a great deal in the profitable and satisfactory use of a separator.

While there is an ample discount for cash, if the user can't conveniently buy in that way he can do so on such liberal terms that the machine actually pays for itself by its own savings.

There is no reason why every farmer having cream to separate should not buy a separator this year, and there is surely overwhelming reason why it should be a DE LAVAL.

A new DE LAVAL catalogue to be had for the asking will interest everyone thinking of a separator.

At a bargain, one Davis No. 3 hand cream separator. New. N. J. Shepherd, Eldon, Mo.

Combination Thief - Proof Whip and Walking Stick

The Greatest Novelty of the age. No buggy whip complete without one. Price, \$1; postage paid. E. T. Davis Co., Tippecanoe City, Ohio. Send your orders haled.

A Reward FOR THE Man Who Milks

The man who ships his cream direct is rewarded for quality. He stands alone. He doesn't have to bear the burdens and suffer for the mistakes and carelessness of his neighbors. If your cream is clean and not too sour and good flavor, you get the highest grade and the best price. If your facilities for handling your cream are better than your neighbor's and you can keep it longer you need not ship so often. Consequently you economize on time.—"Time is money."

Everything favors the individual shipper.

Our system takes care of him. Our factory is his natural home.

Send us your cream and we'll send you the money.

Respectfully,

BLUE VALLEY CREAMERY CO.,
ST. JOSEPH, MISSOURI.

THE KANSAS FARMER**The Poultry Yard**

Conducted by Thomas Owen.

Lice On Chicks.

EDITOR KANSAS FARMER:—Could you tell me what to do for my little chicks? They seem well for a week or two and eat well and of a sudden they spin like a top and die in a few minutes. I feed them cheese, hard boiled eggs, beans, peas, corn-meal, and plenty of onions all mixed for a meal. A. K.

Pfeifer, Kansas.

Answer.—Your chicks act as if they were troubled with the large gray head lice so common to young chicks. They bore into the head of the chick causing dizziness and apoplexy. Grease the heads with grease into which has been mixed a few drops of carbolic acid. See answer to Ellis County subscriber in regard to feeding grit to young chicks.

State Turkeys.

Do you know where I can get eggs of full-blooded dark gray turkeys? I would like to get some eggs as quickly as possible. If you know where I can get them will you please let me know?

Cloud County. J. E. MAILHOT.

Answer.—Our correspondent wants what are known as State turkeys. Breeders of same would do well to advertise them in THE KANSAS FARMER.

Indigestion In Chicks.

EDITOR KANSAS FARMER:—Will you please give in the columns of your paper the causes of little chickens dying. They are strong and healthy when they hatch out but in a few days their bodies and feet shrink to nothing and they eat until they die. They are not lousy nor bred in. I feed them cracked corn wheat and boiled meat, sweet milk and clear water. Ellis County.

A SUBSCRIBER.

Answer.—The one great cause of mortality among young chicks is indigestion. This is caused, not from a lack of any kind of food, but because they are fed and pampered too much. They are fed too soon after they are hatched. For at least thirty-six hours they do not need any feed, it being necessary for them to fully digest the yolk of the egg which they absorb just before hatching. Another most essential thing is that chicks should have plenty of small sharp grit. Before feeding them anything else let them take all the grit they will and keep it constantly before them. If you have not the regular chick grit, coarse sand will take its place though not as good as the grit. This and plenty of exercise ought to make your chicks thrive. Of course, you must look out for lice and grease their heads and under the wings occasionally with any kind of grease mixed with a few drops of coal oil or carbolic acid.

Feather-Eating Fowls.

My chickens are losing their feathers around the neck. I concluded it must be a parasite and washed the parts with an emulsion of thin soap, carbolic acid and sulfur, but it had no effect.

My poultry house is as clean as lime and lime-wash can make it. The roosts get a frequent painting with clean grease mixed with crude coal-oil. The roosts are planed 2 by 4 scatlings. The chickens are healthy otherwise and are doing well. Can you give me cause and remedy through THE KANSAS FARMER? MRS. J. M. YOUNG.

Leavenworth County.

Answer.—If the loss of feathers is not caused by parasites it may be caused by feather-eating fowls. This habit in fowls when once acquired is very difficult to break though feeding lots of meat will help the difficulty. Salting their soft food will also help dispel the craving for feathers. It is the blood in the quill they are after as it has a salty flavor. Too many roosters with a flock of hens will often cause the hen's head to be picked clean of feathers. The remedy for this is to allow only one rooster to each dozen of hens.

Poultry Pointers.

A dust bath is essential to fowls' health and happiness. By it they scour off the scurf and scales from the skin and rid themselves of vermin. The finer, lighter, dryer the dust the better, because the dust must be light and fine to get into the lice to kill them. It is much easier to provide dust baths so as to keep the lice from appearing than to get rid of them after they once get a good start. Sandy loam is often better than sand or some kinds of road dust which are coarse and

418 Kansas Avenue, Topeka, Kansas

heavy. Wood ashes and coal ashes lighten it up. The best place for the dust bath is in the open air of the scratching shed. Here the dust quickly settles and the hens that are not compelled to breathe it.

Every year the earth that forms the floor of the poultry houses should be removed to the depth of three or four inches and fresh earth put in its place. This is very necessary to the health of the fowls as the soil, after forming the floor of a house for a year, becomes filthy from droppings and germs that promote disease. A neglected house is a sure breeder of cholera and other ailments to which poultry are heir. When the fresh soil is put in, it is well also to make a thin whitewash, add a gill of crude carbolic acid to every gallon of the wash, then apply with a spray pump, forcing the mixture into all the crevices of the building, roof and sides. This is an excellent purifier and germicide as well as destroyer of lice and mites upon whose presence in the house it is usually safe to rely on. Then litter should be placed on top of the fresh earth floor. This litter serves to carpet the floor, keeping the birds' feet warm as well as serving as a medium in which to mix the small grains to encourage the fowls to scratch and thereby obtain the exercise they so much need. Four inches of litter is plenty, as too much rather discourages the efforts of the fowls and they do not take as much exercise as if a smaller amount of litter was used. The yards outside of the houses should be plowed up early in the season so as to purify the ground and give the hens a chance to dig up worms and scratch around generally. The yards should be plowed up several times during the year.

Poultry Notes.

Fowls that have the run of the farm do not need much grain, especially during the growing season. The bugs and other different insects that they pick up readily take the place of it.

When the hens stop laying, in many cases it will be found a good plan to try to start them up again by changing the feed. Reduce the grain to a minimum and give them meat and skim-milk in liberal quantities.

Early-hatched fowls can only be made profitable when they have the best of care. If allowed to run about out of doors on cold, wet mornings or if exposed to severe storms, considerable loss may be expected.

When chickens are scattered about the brooder they are all right; when huddled together they are cold; when they stick their heads out from under the curtains they are too hot. They will grow and thrive if kept in a warm even temperature.

In feeding poultry for market, apply the same principles that you do with other stock. When you begin to fatten them do it just as rapidly and systematically as possible, otherwise no profit will be realized. Ordinarily, two weeks of good feeding should fatten a fowl.

Chickens, when confined in coops or limited runs so they get no food except what is furnished them, should be supplied with scraps from the table, bone-meal, and vegetables with their daily feed of grain. Feed a good variety, feed liberally, but never feed more than is eaten up clean at any one time.

The best way of feeding corn-meal to poultry is to pour boiling water over it, which practically cooks it. A common error is to make the feed too wet and soft in which state it is more or less injurious to the fowls, compelling them to take more water than their nature requires. One of the poorest feeds for poultry of any kind is corn-meal mixed with cold water. Even cold milk is a decided improvement.

Until the poultry are past all danger of drowning, it is well to restrict their range to a lot near the house so as to be able to recoup them at any time should showers threaten, and no matter how balmy and clear the evening, always see them safely sheltered at night. A good day run is absolutely necessary for the health of the turkeys, either young or old, and it is useless to attempt to keep them on damp, cold, or marshy ground. N. J. SHEPHERD, Eldon, Mo.

A magnificent steel engraving of Hagerman Pass, the most famous mountain pass in Colorado, has been issued by the Colorado Midland Railroad. This engraving is 26 by 40 inches and suitable for framing. It will be sent to any address on receipt of 15 cents in stamps by Morell Law, traveling passenger agent, 566 Sheldley Bldg., Kansas City, Mo., or C. H. Speers, G. P. A., Denver, Colo.

able supply in sight for the next several weeks. Run to day 5,000, market 10c higher. Clipped stock will preponderate from now on, clipped lambs selling at \$5.25@\$5.50, clipped weathers \$4.75@\$5.25, woolled lambs \$6.15@\$6.60, ewes \$5.50@\$7.50, a few yearlings \$6.60@\$6.25. Woolled feeding lambs, 66 pounds, sold at \$5.90 last week, spring lambs \$9 @11. J. A. RICKART.

South St. Joseph Live Stock Market.
South St. Joseph, Mo., April 16, 1906.

The cattle market was irregular last week, but beef steers closed without much net change, cows and heifers 10@15c lower, stockers and feeders a shade higher. To-day the run is 9,000 head, market steady to strong. The beef steers last week began to show signs of the wind up of the winter feeding, more tail ends than usual, and less toppy lots. A few drovers sold at \$5.60@\$5.85, but the number above \$5.25 was much smaller than in recent weeks. Top to-day is \$5.35 in the native division, although some fancy quarantines sold at \$5.50. There was nothing to speak of here last week from Colorado or the West, as there has every week for a month or more before. One fancy lot of 907-pound native feeders, raised in Northeastern Kansas, sold at \$5.15, highest price for feeders this winter, and one lot of fancy-bred stockers from New Mexico sold at \$5.45c per pound.

Cattle receipts so far in April continue the rate of increase over a year ago that has been maintained ever since January 1, nearly 30 per cent. Not as many cattle are going to the country, but packers are absorbing the surplus, which makes their operations on a scale of 40 per cent heavier than at this time last year. Of course, at this time last year there was a scarcity of beef steers, and the price was rapidly advancing, standing about \$1 higher than at present, top prices last week ranging on the various days from \$5.30@\$5.85, against \$6.15@\$6.75 same week last April. Bulk of steers sell at \$4.65@\$5.25, good heifers \$3.75@\$4.75, cows \$3.25@\$4.50, canners and stock cows \$2.25@\$3.25, bulls \$3.15@\$4.25, veals lower, \$5.60@5.50, feeders \$4@\$4.75, stockers \$3.75@\$4.60, exceptions on both sides of these figures.

Hogs steadily advanced last week, and predictions favor still further gains this week. The top to-day was \$6.60, market steady, bulk of sales \$6.40@\$6.50. Farmwork is occupying all of the time of feeders now, and although the high prices lead some farmers to make sacrifices to market everything available, receipts will probably continue moderate. Packers are not able to get more than 50 per cent as many hogs as they want. Weights below 200 pounds held up strong as compared with butcher weights, which command the top, while heavies have sunk back a notch.

Higher prices for mutton seems to be inevitable, account of the small avail-

CATTLE.

WHEAT FARMS ON EASY TERMS IN Sherman County, Kansas

At from \$5 to \$15 per acre. One crop will pay for the farm. Healthful climate, splendid schools, railways close at hand, good neighbors. Soil is black loam, good depth, no sand, very productive. 1905 Wheat crop averaged 25 bushels to the acre. Write me at once, as these farms will not last long at the present prices.

Albert E. King, McPherson, Kansas

Stand Up for Osborne County

In the great Solomon River Valley, the richest section of the Northwest. The best all-purpose county in the State. The home of Alfalfa, the king of all grasses, where land values are always increasing, where prices now are very low. The most productive soil the sun ever shone upon, ideal climate, abundance of pure water and timber. Prices \$10, \$15, \$20, \$25 and \$35 per acre. These prices will double inside of two years. Write me for full particulars and list of farms.

A. L. BROWN, (the man who sells Osborne County lands),

Osborne, Kans.

We do not deal in extreme Western lands, hot air, hot winds, sand, sage brush and blue sky, but handle Osborne County lands, exclusively. That's what makes our business grow.

Mention Kansas Farmer when you write.

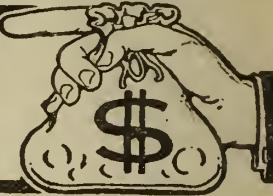

WE GIVE YOU TEN YEARS TIME

in which to pay for

Farm and Ranch Land in Kansas, Nebraska and Colorado

All you need to make the land pay for itself and also make you and your family independent for life. Low Prices.

Horses and Mules**FRANK IAMS**

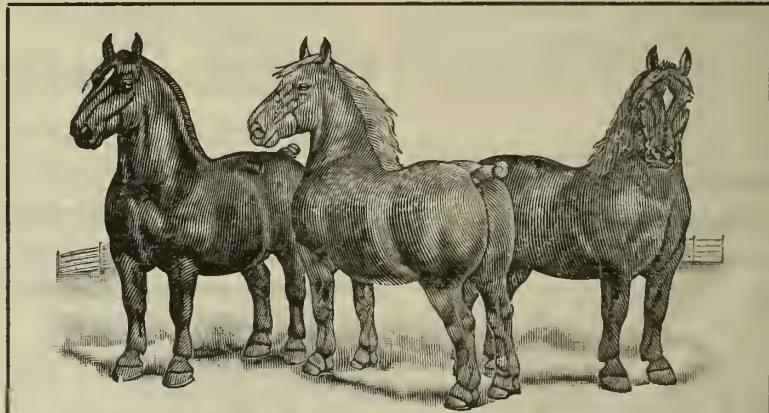

and his "Big 4" three year old Percheron stallions, weight 8340 pounds. Winners of 1st, 2d, 3d and 4th prizes at Iowa and Nebraska State fair (over all). They are "sensational show stallions"—"Iams' sort," Iams sells models like these "Peaches and Cream" stallions at \$1000 and \$1500. It's up to you, Farmer John! Will you be "humbugged" by "bunco salesmen?" Iams owns and sells more 1st-class stallions than any man in the United States. He has his "scam" gets away from Iams. "Iams' daily "Horse show" and his "Town of horse barns" filled to the roof with wide-as-a-wagon "black boys."

50—STALLIONS—50

2 to 6 years old, weight 1700 to 2600 pounds, 90 per cent blacks, 50 per cent ton stallions." All registered, approved and stamped by European Government. Dad, it's "100 to 1" that Iams is pushing his competitors off the roof and hypnotizing his buyers with "top notchers" at 50 cents on the dollar, "let live prices." Iams' "horse show" at Iowa and Nebraska State Fair was the "talk of the town." The "best ever." All winners and sons of winners. His 2, 3 and 4 year old Percherons, Belgians and coach stallions won every 1st, 2d, sweepstakes and grand sweepstakes prize at Nebraska State Fair. At Iowa State Fair they were winners of 90 per cent of same prizes in above classes, and the Iowa and Nebraska people said Iams is a "hot advertiser" but "he has the goods" better than he advertises. Teddy, it's "10 to 1" that Iams' "Peaches and Cream" stallions are "hot stuff" (for competitors). "It's a cinch" that Iams saves his customers thousands of dollars in commissions and middlemen's profits. Iams places \$1000 insurance for \$60.

\$1000—SAVED AT IAMS'—\$1000

Ikey! What a rich graft these "slick stallion salesmen" are working on the honest farmer selling 4th rate stallion at \$2000 to \$5000. Iams sells "top notchers," so good, big and cheap that they do not need to be peddled to be sold. Mr. Buyer, see Iams' stallions yourself. Take no "gold brick stallion salesman's" word. Iams has "the goods" you read about. His establishment is worth going 2000 miles to see. Iams makes his competitors "holler." He is knocking "high prices" out of the X'ms tree. Iams saws wood, "butts in," sells more stallions each year. He makes every statement good. Georgie, dear! Buy a stallion of Iams. His \$120 stallions are much better than our neighbors paid those Ohio men \$4000 or. Then I can wear the diamonds. Iams speaks the languages, buys direct from breeders, pays no buyers, salesmen or interpreters, has no two to ten men to divide profits with. Iams guarantees to sell a better stallion at \$1000 to \$1500 than are sold to Stock Companies for \$2500 to \$5000 by slick salesmen, or pay you \$100 for your trouble, you the judge. Iams pays horses' freight and buyer's fare; gives 60 per cent breeding guarantee. Write for eye-opener and greatest horse catalogue on earth. References: St. Paul State Bank, Citizen's National Bank, St. Paul, Nebraska.

Matchless 18th..... Statesman 15539..... S. Campbell
Imp. Matchless 16th..... Senator (27441)..... A. Cruickshank

In selecting the foundation of my herd I was careful to get the best Cruickshank breeding and individuals to be found, and they cost me from \$500 to \$1000 each. This consignment is made up of choice young animals, many of which I would have preferred to keep, but it being my first sale in the West, I desire to make it an attractive one. All cows and heifers old enough for service will be safe in calf, or have calf at side by the Scotch bulls whose pedigrees will appear in the catalog, which will be sent on application. Breeding lists furnished at time of sale. This will be a good time to get choice show cattle and herd-heads.

WHY NOT
LIVE WHERE
YOU CAN HAVE
SOME
PLEASURE
NEAR AT
HOME?

This is truly a Wonderland, occupying the central part of the great San Joaquin Valley and embracing almost every variety of climate and production of the Northern Continent. There is no land on earth where extensive farming is more profitable than on the Fresno Irrigated Farms. The intensive method of farming brings land to its highest degree of cultivation, produces more comfort in the home for the reason that it makes neighbors very much closer. Thousands of acres of the richest soil in the world lie waiting the coming of the small farmer on the tract of the Fresno Irrigated Farms Co. It is only under intensive farming that these lands will give up their best. When the land is worked to its utmost that best is something never dreamed of by farmers of the older States.

EXPENSES are light on the small diversified farm and one is always certain of having the table necessities. This is not a shiftless man's country for to succeed on a small farm in this State a man must apply himself to the business on hand. Hundreds of successful men in California made their start and achieved success through diversified farming, having bought their land and made part payment in the beginning and then cleared their places in three years from the proceeds. Why can't you do the same?

If you have \$800, \$1,000, \$1,500, or \$2,000 write to us and we will give you information that is interesting. Remember this depends upon the man.

The demand in California for the produce from the diversified farm is increasing. The wonderful amount of tourist travel has created a demand for the luxuries of life faster than our farmers have been able to supply them. Why shouldn't you get the benefit of this condition? Write us at once for our illustrated 64-page booklet, giving full particulars. We will mail it to you free.

KANSAS FARMER

Volume XLIV. Number 17

TOPEKA, KANSAS, APRIL 26, 1906

Established 1863. \$1 a Year

THE CALIFORNIA EARTHQUAKE.

Early on Wednesday morning, April 18, the city of San Francisco and surrounding country were violently shaken by an earthquake. As people rushed into the streets in their night clothes, the earth seemed to heave and roll beneath their feet, massive buildings tottered and fell, and fire broke out in the falling structures. Many were killed, many were injured in various ways, and some are believed to have perished in the flames. While it is known that several hundreds met violent deaths, the exact number has not been ascertained and will probably never be known. The earthquake broke the water-mains so that the firemen were deprived of their usual means of combatting the flames. They resorted to dynamiting whole blocks of buildings in the hope of checking the fire, but, fanned by the fierce winds, the fire leaped at a bound the openings created by the dynamite, and the destruction sped on until about three-fourths of the city had been burned.

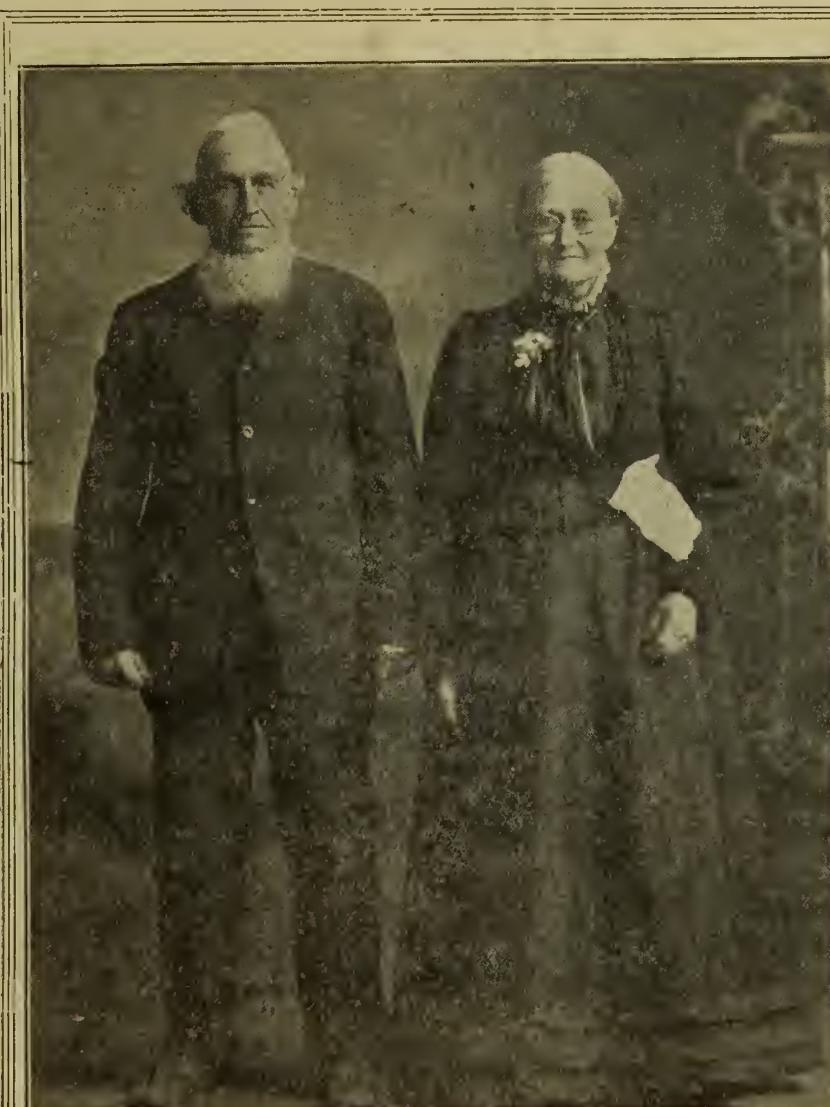

It has been stated that 250,000 people were rendered homeless. Most of them gathered in the parks and in other open spaces. Their privations, their sufferings, and their losses appealed powerfully to the sympathies of their fellow men all over the country, with the result that relief in large measure was despatched to the stricken as rapidly as express trains could carry it. A million dollars was promptly appropriated by Congress, and a million and a half followed on Tuesday of this week. The railroads promptly offered to carry all relief goods free of charge. Without delay, Kansas despatched many carloads of flour, carloads of meat, carloads of potatoes, and in addition, telegraphed thousands of dollars in money. With commendable promptness and energy, Governor Hoch addressed himself to the work of obtaining and forwarding relief. He was placed at the head of the State committee and in cooperation with other willing workers did effective service in promptly sending supplies to starving and shivering unfortunates.

The confusion which resulted from the sudden and prolonged catastrophe called for the exercise of prompt and decisive authority. The Golden Gate City was fortunate in the fact that the military post there was commanded by a man of the judgment and capability of General Fred Funston, who, without waiting for orders or the unrolling of any red tape, promptly issued and caused to be executed orders which rapidly brought chaos to an end, made looting dangerous, systematized relief work and restored sanitary conditions.

The relief work was at first placed in General Funston's hands, and was executed with a soldier's promptness and a philanthropist's tenderness. Later, the relief work was turned over to Dr. Edward Devine, of the National Red-Cross organization.

The California coast has had previous experiences with earthquakes. On October 21, 1868, San Francisco was shaken by an earthquake in which four persons lost their lives. After this, many houses were constructed of redwood logs neatly dressed and usually covered with weatherboards. Tall buildings were tied with iron rods as security against earthquake shocks. In the early days of the city, it was several times destroyed by fire, but after each fire a finer city took the place of the one destroyed.

The San Francisco just now the center of interest contained, a few days ago, about 400,000 people. Its wealth and business were immense. Doubt-

Mr. and Mrs. T. F. Little, Emporia, Kans., Who Have Taken The Kansas Farmer for Forty-One Years.

EDITOR KANSAS FARMER:—We thank you for your kindness in sending us a free KANSAS FARMER the past year because of our age and length of time we have taken THE KANSAS FARMER (since 1865), and we would show our appreciation of your kindness by enclosing one dollar for the Y. M. C. A. building. We are glad to have lived in Kansas while it is being made a great; GREAT, GREAT State, and THE KANSAS FARMER has helped.

Emporia, Kans., April 14, 1906.

MR. AND MRS. T. F. LITTLE.

less a more beautiful city will spring from the ashes and ruins. Doubtless the advances recently made in fire-proof construction will make the new city secure against such losses by fire as have just been experienced. Buildings of Portland cement concrete reinforced plentifully with steel rods are practically proof against fire. In many modern buildings this construction is used not only for walls but for beams, floors, ceilings, and roofs. Metal casings and doors furnish nothing to burn, while glass in which pigeon wire is embedded retains its place even though the heat break it. It remains to be seen whether such construction can be so strengthened by increasing the numbers of steel rods as to make it secure against earthquakes. There is little doubt but that, properly used, such materials may be so made as to be capable of resisting shocks that would throw down buildings as usually constructed of brick or stone and mortar.

While some will probably want to get away from the scenes of the great catastrophe, while some will fear a

repetition of the earthquake, most persons will quickly recover from the shock. It will be realized that it takes nature a long time to get ready for such a convulsion, so that the middle-aged person who now lives at San Francisco is not likely to see another like calamity.

CLEANING DODDER-INFESTED ALFALFA-SEED.

Recent experiments conducted by F. C. Stewart and H. J. Eustace, of the New York Agricultural Experiment Station, show that almost any alfalfa-seed on the market may be made practically free from dodder and safe to sow by careful hand-sifting through a wire sieve having twenty meshes to the inch. A cheap, serviceable sieve for the purpose may be made by constructing a light, wooden frame about 12 inches square by three inches deep and covering the bottom of it with twenty-mesh wire-screen made of No. 32 (English gauge) round wire.

One-fourth to one-half pound of seed should be put in the sieve at a time and vigorously shaken during one-half

minute. A man should be able to clean from five to ten bushels of seed per day.

Dealers in alfalfa-seed should either sift all the seed they sell or else provide their customers with the means of doing the work themselves. Dodder is so troublesome a weed that no one can afford to take the risk of sowing unsifted seed.

POISONING CUT WORMS.

The Oklahoma Experiment Station reports that further experiments in poisoning cut worms, which have been working on wheat and alfalfa, have shown the following mixture to be superior to spraying with Paris green, as formerly recommended:

Thoroughly mix while dry, one pound of Paris green and fifty pounds of wheat bran, make moist, but not sloppy, by adding water in which a quart of cheap molasses has been dissolved. Place this mixture in spoonful piles where the worms are working. It attracts the worms from the wheat and oats. It is also good grasshopper poison.

A VALUABLE HOOK.

One of the most valuable books recently published is Black's Medical Dictionary. It is written so any intelligent person can understand it. More than its name implies, it describes as well as defines. By its use one can be informed of the treatment of the common ailments. The value of the book for general use is best shown by a quotation as follows:

"FAINTING or Syncope, is a temporary loss of consciousness associated with feeble action of the heart.

"CAUSES.—The manner in which the loss of consciousness is produced appears to be that the feeble heart is unable to pump blood up to the brain, thus causing anæmia of that organ, and rendering it unable to act. If the person who threatens to faint lies down, or, still better, if she sits and then bends forward so as to bring the head below the knees, the faint is averted. The feebleness may be due to some long-standing heart disease, which through an overstrain suddenly reaches a climax. Or it may be a part of the general muscular relaxation which takes place in a hot bath, fainting in a bath being sometimes a cause of death in weak persons. Powerful emotion, generally of a sorrowful nature, but sometimes even great joy, is a very common cause. Extreme pain, such as that due to the crushing of a limb, and shocks to the nervous system, such as a blow on the head or on the abdomen, are very apt to cause fainting, or even the more serious condition known as "shock." Disgusting smells and sights, breathing of bad air, and general exhaustion are also causes. As a rule, a combination of these causes is necessary, except in hysterical persons, and persons weak from some illness, who are specially liable to faints. Certain drugs which depress the heart's action, such as tobacco or chloroform, when taken in large amount, produce syncope.

"SYMPTOMS are well known. There are certain warning symptoms, such as pallor, feebleness of the pulse, a sinking feeling, and a dulness of sight and hearing. When the faint has occurred, the person lies still, breathing very faintly, with feeble pulse, pallid complexion, and often perspiration standing in drops on the face.

"The faint, as a rule, lasts only a few seconds or minutes, but it may last for hours, and hysterical persons may pass from one faint, only to fall into another, several times.

"TREATMENT. The faint may often be prevented by attending to the cause

as stated above. The person in a faint should be laid flat on the back, and care should be taken that breathing is unimpeded. If care be not taken to leave the fainting person lying flat, death may ensue, but if this be attended to nothing more is usually necessary. Stimulants may be applied to the skin in the form of cold compresses on the head, slapping of the hands, pinching of the cheeks; or to the nose in the form of smelling-salts or eau-de-Cologne, or the pungent fumes of burnt feathers."

The book is published by the Macmillan Company, New York. It may be had postpaid through THE KANSAS FARMER at publisher's price, \$2.50.

Investigations of the U. S. Geological Survey have resulted in the collection of data that may lead ultimately to the introduction into general use of a new form of power—that developed by the gas producer and gas engine. The most gratifying discovery developed by this investigation is the fact that the cheaper coals—lignites that have heretofore hardly paid for mining—have been found, both in their natural condition and after briquetting, to be especially adapted to the production of power.

A SOUTHWESTERN DEVELOPMENT ASSOCIATION ORGANIZED.

The convention of Southwestern interests held at St. Louis last week was a large gathering of delegates from various sections of the vast domain lying west of the Mississippi River and south of the 40th parallel. The purpose was to promote a more complete development of the resources of a country whose possibilities have been but partially realized and slightly used.

The representations made by the delegates showed that the greatest need of nearly every section is more people. In some localities more and cheaper capital is needed, but in general, money is ready or easily obtainable.

The largest delegations were from Arkansas, Oklahoma, Indian Territory, and Texas. Kansas had but few representatives. It is fortunate for the State that Governor Hoch was there. He was more in demand than any other speaker, and his joyful devotion to and admiration of Kansas met a ready response.

The deliberations resulted in the formation of a permanent organization under the name "Southwestern Industrial and Development Association." The plan of organization is comprehensive, and if fully carried out should lead to more rapid realization on the dormant wealth of this great region.

The convention adopted the following resolutions reported by the committee:

Resolved, That we demand of Congress the immediate passage of a Statehood bill in the interests of Oklahoma and Indian Territory.

These Territories have met the requirements any set of fair-minded men should exact of them, and are entitled to have conferred upon them the right of self-government. The entire present condition of government in these Territories is to retard the industrial development of the entire Southwest, and is a crime against the civilization of this age.

Resolved, That a copy of these resolutions be wired at once to the President, Senator Beveridge, and Representative Hamilton.

Resolved, That we appeal to Congress to enact a law at its present session removing restrictions on the alienation of the surplus allotments of Indians in the Indian Territory of less

than full blood. We believe, after carefully studying the question, that the Indians of that Territory, of mixed blood, are taken as a class, as competent to manage their affairs as the average citizens of the several States, and to deny them this right is an insult to their intelligence, and will tend to discourage them, rendering them less fitted for citizenship than they are at present.

That the present law in force in the Indian Territory in its practical application is in direct line with the desires of the so-called grafters, and will result in the lands being bought up in piecemeal by that class of speculators, to the detriment of the bona fide settler and Indian owner, and to the hindrance of the industrial development of that section of the Union and the entire Southwest.

That it is the desire of the Indian owners of the land that the recommendations we make be embodied in a law.

We make this request to Congress after careful consideration of the question in all its phases, and believe that justice to the people concerned demands the passage of such a law.

Resolved, That a copy of this resolution be wired to the President, Secretary of the Interior, Senator Spooner, Senator Clapp, and Representative Curtis.

Resolved, That this convention heartily endorses the work of immigration now being carried on by the various railroad systems traversing the Southwest and desires to encourage such work by its moral support and hearty cooperation.

Resolved, That the various States here represented be urged to establish publicity and industrial bureaus through their several Legislatures and provide funds for the support of such bureaus, so that the advantages of the Southwest may be more advantageously and aggressively advertised.

Resolved, That this convention heartily endorses the work undertaken by the National Rivers and Harbors Congress, which convened at Washington, D. C., on January 15, 1906. That it recognizes the necessity for improving the waterways of the United States as the most potent and forceful means of internal development. That it recognizes the importance of having the Congress of the United States make more liberal and generous appropriations for the river and harbor work in the future. And it is the sense of this convention that the various clubs here represented give their hearty support to the work of raising funds to educate the people of the United States to the necessity of having such liberal appropriations made."

Resolved, That the commercial and industrial interests of the Indian Territory demand that some disposition should be made of the segregated mineral lands, whereby the surface of the lands can be cultivated, pending investigation of the lease conditions in that Territory proposed to be made by Congress.

That unless such provision is made thousands of acres of land will be allowed to remain idle, to the detriment of the business interests of that section of the Southwest.

Resolved, That a copy of this resolution be wired to the President.

Resolved, 1. That it is the sense of this convention that the United States should be represented by not less than seven commissioners in the Pan-American Congress to convene in Rio Janeiro, Brazil, in July of this year, and that at least one of them should be a resident of that portion of this country, lying west of the Mississippi River, and another of that portion of this country lying east of the Mississippi River and south of Mason and Dixon's line.

2. That this convention tender United States Senator Morgan, of Alabama, its thanks for calling the attention of Congress to the lack of representation of the sections herein named in said Pan-American Congress and causing means to be provided for the same.

Whereas, with the understanding that this convention when called had for its principal object the building up of our respective sections by securing desirable immigration; therefore, in order that this great subject of immigration may not be lost sight of in the multiplicity of other matters, it is resolved,

Resolved, That the great Southwest will most cordially welcome good people from any of the other States of the Union and from foreign countries.

Resolved, That in the Southwest section of this country there is a great field for the employment of labor at good wages, and an undeveloped empire of resources for the profitable employment of millions of capital now lying idle or bringing in only small returns in the Northern and Eastern States.

Resolved, That it is the sense of this convention that the question of immigration is paramount to all others, and that some plan should be formulated, that action may be taken in a decided and forceful manner. We recognize that nothing can be accomplished without financial aid, and we think that in addition to the duties of the vice president and secretary of each State and Territory, they should also be required to make and collect an assessment and advertise each State and Territory as a part of the Southwest.

The exercises closed with a banquet tendered by the St. Louis Mercantile Club at the Jefferson Hotel. About six hundred guests sat down at 8 o'clock. At 10 o'clock the speaking began. Several Governors and other persons of note had made their remarks by 12 o'clock, at which hour Governor Hoch was invited to respond to the toast, "Kansas." His attempt to cut short his remarks was met with many calls to "go on." The Governor did "go on" for over an hour with a speech in which argument and jollity were so intermingled and made to reinforce

BUY THE WAGON THAT'S MADE IN SAGINAW

The Handy Wagons made in Saginaw are made by men who know how a handy wagon should be made and who make it as it should be. That's why they last longer, run easier, carry heavier loads and give satisfaction. Farmers know the advantage of a low wheel, wide tire, light draft wagon—but there's more than one kind—the good and bad. To get the best, buy the

FARMER'S HANDY WAGON

made in Saginaw. We make them of the most durable material, hardwood, clear selected stock and first-class metal constructed on the most approved method. They are sold at a reasonable price, and built for a life-time of service. Our free 1906 catalog gives detailed description and tells why they are the best low-down farm wagons made. Write for it. Address

FARMER'S HANDY WAGON CO., SAGINAW, MICH.

Also makers of Handy Hay and Stock Racks and Handy All-Steel Frame Silos.

Branches at Kansas City and Des Moines.

each other that cheers came from even those who had advocated adverse views. One of the most telling periods was that in which he endorsed and admired the record and positions of Governor Folk, of Missouri.

BLOCKS OF TWO.

The regular subscription price of THE KANSAS FARMER is one dollar a year. That it is worth the money is attested by the fact that thousands have for many years been paying the price and found it profitable. But the publishers have determined to make it possible to secure the paper at half price. While the subscription price will remain at one dollar a year, every old subscriber is authorized to send his own renewal for one year, and one new subscription for one year, and one dollar to pay for both. In like manner two new subscribers will be entered, both for one year, for one dollar. Address, The Kansas Farmer Company, Topeka, Kans.

Miscellany

The Agricultural College Y. M. C. A.

The subscriptions for the Agricultural College Y. M. C. A. building are progressing favorably. The following letters to Secretary McLean have the right ring:

A FARMER'S LETTER.

Inclosed \$5 for your College Y. M. C. A. building. I think Kansas farmers can do nothing better for their boys than help complete this building and then contribute to the best possible work of that organization.

Manhattan, Kans. W. FRYHOFER.

THE GOVERNOR'S LETTER.

The effort made by the young men of the State Agricultural College to erect a Y. M. C. A. building in Manhattan for the benefit of the students of that institution and other young men is a noble one and worthy of every encouragement. When erected it will stand as a monument to the faith and work of these splendid young men, and of honor to the beautiful city in which it is located. E. W. HOCH.

THE CENTURY GRADER
Best Light Grading Machine made. Grades Roads, Cemeteries, Lawns, Parks, Race Tracks; Levels Land for Irrigation, Cuts Ditches, Clause Feed Lots, Barn Yards, Etc. Easily operated by one man. Light, practical and low priced. For general use about the farm or for grading town streets or country roads this grader is unequalled. Descriptive Catalogue FREE.
The WHITE CITY GRADER CO. Box F-7 WHITE CITY, KAN.

Modern Silage Methods
That is the title of our new 216 page book. It tells everything anybody could possibly want to know about the silage subject. You can't think of a question that it does not fully answer. How to build, from foundation up, all kinds of silos. All about the crops and how to cut and fill. How to feed, with the most complete feeding tables ever published. About 40 illustrations help to make things plain. Used as a text book in many Agricultural Colleges. We have always sold the book for 10 cents, but for a limited time, to any reader who will ask for it, and name this paper, we will send a copy free. Write at once.
SILVER MFG. CO., Salem, Ohio.

Agriculture

Selection of Seed-Corn.

EDITOR KANSAS FARMER:—I have been a reader of THE KANSAS FARMER for some time and there are some things that are of particular interest to me and I think should be to every tiller of the soil. One of these things is corn and corn with a capital C. Men that try to raise corn should make it more of a business than they do and not do so much haphazard work. I believe that the first thing to take into consideration is seed, and I have found by experience that the best way to have good seed is to save it myself. I will give the plan that I followed for a number of years in Northeastern Iowa.

I found that seed selected late in the season when husking to crib would vary from one to four weeks in time of maturing, which in some seasons made a lot of soft corn. I found that to have corn that ripened uniformly you must plant seed that ripened at the same time, so I used to go through the field when the husks began to turn and select my seed for the next year. I selected ears of a certain type, of uniform size and maturity, and as near perfect as possible. I left husks enough on the ears to tie them together two and two, and hung them where they would dry thoroughly. When dry I sorted out the best, shelled them, and put the seed in barrels. I headed the barrels up and set them where no moisture could get to them. It was some trouble but the stand of corn I used to get from the seed more than paid for the trouble. I am going to follow the same plan in Kansas.

Franklin County. H. E. CURTIS.

Alfalfa Sown on Sod.

EDITOR KANSAS FARMER:—In your issue of March 22 J. J. Hyssell, of Rice County, asks about sowing alfalfa on sod. While the practice is generally discouraged in Eastern Colorado where people are coming in and starting new on their homesteads, there are several cases where the sod was broken 2 inches deep and harrowed well and alfalfa sown that have proven better than cases where alfalfa was sown on old ground, and we believe if sown just at the time of the spring rains it will grow better than when sown on old ground. Alfalfa sown here last spring is now up, and many roots have gone down over five feet as shown by digging. Crops that do well on Eastern soil do not do so well on Western soil, and I think alfalfa will do well on Mr. Hyssell's land if the soil is plowed shallow. Do not be afraid to use the harrow with teeth slightly sloped backwards.

HOWARD GAMBLE.

Kiowa County, Colorado.

Kentucky Blue-Grass for Pasture.

Will Kentucky blue-grass do well here for pasture? J. D. MITCHELL, Dickinson County.

Kentucky blue-grass may succeed fairly well in Dickinson County on low bottom-land and in draws where there is a sufficient moisture supply, but on the average farming-land of your section of the State, Kentucky blue-grass will not prove a very profitable grass to grow for pasture. It is possible that in time the Kentucky blue-grass will become well adapted and grow successfully in your part of the State. In this county (Riley) we find many pastures are becoming fairly well set with Kentucky blue-grass, but the grass is not so productive as other domestic grasses which we can grow. Bromus inermis and English blue-grass are superior to the Kentucky blue-grass in productivity, and the last-named grasses may be used either for pasture or for meadow. It is true that the Brome-grass and English blue-grass may not make so permanent a pasture as Kentucky blue-grass, and I do not recommend using them as permanent pasture, but rather as crops in rotation with other crops, the plan being to seed the land to grasses and clover or grasses and alfalfa and keep the fields in grass for four to six years, when the land should be broken and planted again with corn and other grain crops. Used in this way the Bromus inermis and English blue-grass are productive and profitable grasses to grow, and much larger crops of corn and other grain may be grown by using the grasses as a rotation crop than by cropping the land continuously with grain, as is too often the present practice.

There is no good domestic grass which we can grow for permanent pasture in Central Kansas. If the purpose is to continue the land permanently in pasture, better not break it up but let

the native wild grasses grow, and maintain the soil fertility by an occasional application of manure or other fertilizer and by disking where this is possible. There are probably no grasses so well adapted for growing in Kansas where the land is kept continually in grass as the native Kansas grasses.

A. M. TENNEYCK.

Handling Alfalfa Crop.

Last spring, about April, I plowed 10 acres of ground and left it fallow. In August I re-plowed the land to the depth of about 10 inches, and kept it harrowed down until September 1, when I sowed broadcast about eighteen pounds of alfalfa seed per acre and harrowed it once. I now have a fine, thick stand about four inches high which completely covers the ground. The land is fairly sandy and from 3 to 10 feet to water. I am at a loss to know how to handle the alfalfa. Shall I save any of the crops for hay? How often shall I mow it and when? Shall I mow it close to the ground or not? Please advise concerning best methods of handling the crop and I will follow instructions.

J. B. WANGLER.

Harper County.

You may cut the alfalfa regularly this season. Cut for hay as soon as the plants are about one-fourth in bloom. Mow close to the ground, the same as you would mow any other grass for hay. You ought to secure three good cuttings and perhaps four from this field during the present season. When alfalfa has become well established, as it is the second year after seeding, it may be cut closely and regularly as often as it makes a growth and comes into bloom. In fact it is urged that cutting alfalfa frequently causes it to grow ranker and more rapidly, and a larger production of hay may be secured by mowing relatively early at each cutting. The objection to allowing alfalfa to stand too long or until it is in full bloom before cutting for hay is that the leaves will be shattered more in making the hay than will be the case in harvesting less mature alfalfa, also the young shoots may start again from the crown of the alfalfa before the late mowing, and if these shoots are cut off it delays the start of the new crop and causes a less growth of alfalfa during the season.

A. M. TENNEYCK.

How Is Your Alfalfa?

EDITOR KANSAS FARMER:—I should like to hear how the alfalfa that was sown last fall looks this spring anywhere in Kansas. My guess is that it will be hard to find. Alfalfa will never become as noxious a weed in Kansas as it is in California and Nevada.

J. C. BALCH.
Ferndale, Washington.

Horticulture

The Earth Taste in Kaw Valley Potatoes.

EDITOR KANSAS FARMER:—It is a serious commercial mistake to so handle a crop as important as that of the great potato fields of the Valley of the Kaw in Kansas, as to have to market the product at a low price to make a sale at all because of the deterioration due to allowing an early crop to lie in the ground undug until they can be sold as a late crop. We refer to the earth-taste of potatoes, so plainly apparent to the taste, when the cooked vegetable is served upon the table, and so well known in Lawrence that the private families buy but a bushel at a time. When the householder buys in large lots he demands Northern potatoes or the Colorado Irrigation tuber, and ear after ear are shipped here from outside to take the place of the home-grown potato, which latter has to be shipped where it is not known. Still further we know of growers who raise and ship by the car, who carefully provide their own family supply by purchasing outside potatoes.

The cause of the faulty practice is, of course, a financial one. When the crop matures, the demand is strong and the price good; the crop is dug in haste and shipped; first returns are good; soon hot suns upon wet soil sunburn the potatoes before they can be picked up and sacked; the damage is not noticed; the cars arrive in bad order, and prices break so badly that shipments must stop. If weather conditions have been unfavorable, many potatoes have been shipped with the black sticky soil adhering. Every excuse given the commission-men helps beat down prices; the returns on some ears are ridiculous; on others there is a serious loss. Now here comes in the faulty

practice. If dug and stored in bins, the potatoes go through a sweat and soon rot—a total loss. If allowed to remain undug they keep perfectly until October some years, other years the earth-taste results. When they are dug and handled in late fall, they will keep in ordinary cellar-storage. Are they not in reality an early potato, dug and sold as a late potato?

CAUSES OF EARTH-TASTE.

Now what causes the earth-taste in the undug potato?

(1) Is it a sour soil from excessive wet as is mostly believed? (2) Is it hot sun on dry soil? (3) Is it hot sun on wet soil? (4) Is it the result of the grass-and-weed-sod which forms over the field? (5) Can it be that the tuber is readjusting itself to a new growth, and that this is the cause of the "taste?"

Next comes the problem of a modified field-practice to change the usual conditions prevailing. Running a lister between the rows has been found to be a partial benefit. If done as soon as the vines have died, it affords drainage and buries the crop a little deeper. How would a light application of air-slacked lime, applied with a manure-spreader, act to sweeten the soil? Millet as a catch crop over undug potatoes has been a success in parts of this State; will it act to help sweeten the soil, use up surplus moisture, and afford shade? How will oats-hay act? Sorghum will make a quick shade and will pump out lots of moisture and in the end will sweeten the soil, but it will leave a stiff stubble; will this stubble be harder to handle than the present weeds and grass? Cow-peas will make both shade and growth enough, but they maintain a decidedly moist ground-surface which might injure instead of benefit. So much for an effort to keep the fully matured and undug potatoes from acquiring the earth taste.

STORAGE IN SUMMER.

Now how far has experimentation gone in the successful storage during the hot summer months of the early-dug crop? Will cold-storage finally step in to give us a dry, above-chilling temperature? How small must be the bulk to prevent damage from the sweat? Can we break up the sweat by rehandling at the proper time? How would it do to lay sacked potatoes end for end upon the surface of the ground and cover with earth in a single lengthwise row? A few years since we piled in mid-summer thirty bushels of potatoes upstairs in the barn, every few bushels whitening the pile with a handful or two of air-slacked lime. They kept perfectly until late fall, the rot loss instead of being as usual several bushels was only a single dozen tubers in the thirty bushels. Besides, the lime made the potatoes dry and crisp like irrigated potatoes. But alas, we relimed the potatoes as we stored them in the cellar bins and before spring the lime had drawn the cellar moisture, the potatoes had sprouted, and the bins were an interwoven mass of sprouts and potatoes. Still the liming was a complete success in keeping down rot in loosely-piled, shaded potatoes.

Kaw Valley practice is to plant so very early in the spring as to even chance a late freeze or two. This, with Northern seed, will make the quickest possible crop return for an urgent market. So far so good. But why not confine this first planting to what the market will absorb at that time and plant a late crop for the winter demand?

The two main obstacles are that a too open soil at that time of year (July) prevents the even start of the seed-potatoes; and that it is impossible to hold seed-potatoes without deterioration to that late season. Now can not we go to the Southeast Atlantic States and learn something about second-crop seed-potatoes? Could we get such seed through refrigerator-car and cold-storage service? What can we learn from Michigan and the hill country of Colorado concerning the term-length of the late-crop potatoes, and gauge our planting to our climate?

Will THE KANSAS FARMER, with its unequalled facilities and great influence, kindly invite the potato-growers to take up this subject in its columns? Let us collate our experience, modify our practice where experiment will justify, absorb what experience we can from other fields, and continue to experiment with a view to raising the grade of our product and eliminating the earth-taste from the Kaw Valley potato.

EVAPORATED POTATOES.

Before leaving the subject I wish to refer to another phase of the matter. When the Klondyke rush occurred, a report got out of a new food product evaporated potatoes. Realizing its

There is no satisfaction keener than being dry and comfortable when out in the hardest storm.

F. W. BIRD & SON, (Established 1817)

Chicago, Ill.

importance I asked for information, with the result that a very vague report reached me that as an article of diet they were a disappointment; and as a new industry the evaporating of potatoes failed because of limited demand and the discoloring of the sliced potatoes as soon as cut. All the same, there is a fortune for the man who can evolve a partially prepared food from the potato, to take its place among the many other popular breakfast foods. Say, for instance, that the sliced potato was submitted for so many minutes to a roasting heat of so many degrees; the resultant product mixed equal weight with a carefully browned and roasted corn-meal and then put up in air-tight tin cans, tinfoil, or waxed paper. There is now upon the market and to be had at most groceries, a comparatively new product—Saratoga potatoes; the grocer gets a new supply several times a week from Kansas City—the thinly sliced potatoes are brought to a crisp brown in hot lard; are then drained and packed in pasteboard boxes lined with waxed paper. The grocer keeps them in air-tight glass until sold. As the lard becomes old the crispness changes to a wilted condition, but heating in the oven just before using restores the crispness. The retail price is sixty cents per pound and the demand is brisk for ladies' functions. Why not grind the Saratoga potato and press perfectly dry into cartridge form and wrap air-tight? But enough of this. Who shall discover a new product that will keep better than the tuber itself?

Since writing the above I came across an article from the pen of S. S. Clawson, of Ashwood, Tenn., who writes in part:

"Potato-growing has increased in a radius of five miles of Ashwood, and elsewhere in the country, until there were over 4,000 acres of the spring crop planted there last year. The spring crop must be shipped to market at once, or as soon as dug, as they are very perishable. Within the last few years the farmers of Maury County have been planting fewer acres of the first crop and more of the second, as the second is more profitable. The second crop need not be sorted for seed purposes, the small ones being as good for seed as the large. The second crop is a pure gift, as the seed comes from the small ones of the first crop."

Now, if any Kaw Valley growers have experience with Tennessee second-crop seed-potatoes, why not let it be known; if not, why not try them? Would it be possible to plant the late crop to follow a crop of oats or oats-hay? Let us get around the earth-taste if possible and raise the value of our product.

GEORGE WEST MAFFET.

Douglas County.

Spraying Pumps and Methods.

EDITOR KANSAS FARMER:—The rapid spread of fungus diseases will compel those who have large orchards to do some spraying with sulfate of copper to destroy fungus spores, notably the apple scab. The corrosive effect of sulfate of copper, blue vitrol, is such that the cylinder of the pump should be of brass. Iron and steel are very readily corroded and destroyed. In purchasing a pump it is well to select one that shall answer for spraying either with insecticides, such as Paris green, arsenate of lead, and disparene, or blue vitrol, a fungicide.

The pump should have considerable power and be capable of developing a heavy pressure. If the orchard is small and a hand pump is used, it is better to have a pump that can develop a pressure of sixty pounds than one of forty pounds. A pressure of one hundred pounds is very much better. There is, however, considerable doubt of developing one hundred pounds pressure without the use of a gasoline engine.

Experiments conducted in California indicate that a pressure of one hundred fifty to one hundred seventy-five pounds is still more effective. The farmer who simply sprays a family orchard will doubtless purchase a pump, costing \$12 to \$15, and mount it on the head of a kerosene barrel. The orchardist who has ten acres or more should purchase some one of the power sprayers geared to and driven by the wagon wheel.

The writer has used one of this class for fifteen years. Since power of this kind is utilized by driving along the row without stopping, a sufficient amount of misty spray can hardly be applied in the very brief time in which the wagon passes a tree. This defect may be partially overcome by driving and spraying twice around each row.

With an orchard larger than twenty-five acres across, it would be well to select a power sprayer driven by a gas-

oline engine. A gasoline engine of two or two and a half horse power can readily develop one hundred pounds pressure which can be utilized in making a finer mist of the spray and more surely forcing it into the calyx of the apple. There is also a saving of time, a matter of great importance since there are four to six days' time for the securing of the very best results in spraying. It is important that the orchard should be covered as rapidly as possible and thus utilize the very brief period before the calyx closes.

In the selection of the running-gear the tire of the wheel should be at least four inches in width and six inches would be better. R. A. Simpson, of Vincennes, Ind., bolted two three-inch rims, one on either side of a common farm-wagon wheel. In this way he secured a set of rims nearly eight inches in width. Equipped with wheels of this character he was able to haul his gasoline engine and filled tank over any ground that the horses could walk over, a matter of very great importance since it sometimes happens that on flat lands in extremely wet weather the ground becomes so soft that it is practically impossible to haul a tank filled with spray through the orchard.

In the selection of the pump it is imperative that it should be one which has an agitator, keeping the liquid constantly stirred up so the strength of the spray will be uniform. It is also well to use a pump having a revolving brush which will constantly keep the sediment and any stray twigs or leaves free from the base of the pump. Since the liquid must be forced through fine nozzles, the greatest care must be taken to keep the liquid free from lint or sediment which might clog the nozzles and impair the quality of the work.

BORDEAUX MIXTURE.

The ordinary formula in use is four pounds of sulfate of copper, five pounds of lime to fifty gallons of water. In order to dissolve the sulfate of copper and slack the lime with the least trouble perhaps the following suggestions may be useful in doing this work. Should the sulfate of copper be placed in the bottom of the tub or barrel it would not rapidly dissolve since the solution at the bottom becomes too strong to continue to dissolve. The best results are secured by suspending the sulfate of copper in a sack in the upper portion of the water.

The farmer who desires only a small amount for his few trees may dissolve four pounds of sulfate of copper in twenty-five gallons of water. He may put five pounds of fresh lump lime in twenty-five gallons of water. Lime slaked under water in this manner is less liable to burn than when slacked in large quantities in open air.

In uniting the solution of copper sulfate and the lime water, it is not well to pour one into the other but to pour a stream from each into a third barrel large enough to contain the united fifty gallons. The resulting solution is much more effective if the two separate solutions are poured in unison into the third barrel than if one is poured into the other. Those who have large orchards use elevated storage-tanks from which water is drawn off into smaller tanks, in one of which the lime is slaked, and in the other sulfate of copper dissolved. Streams from these are run into a third tank from which the spray tank is filled.

If fifty pounds of sulfate of copper are dissolved in twenty-five gallons of water, each gallon of this stock solution will contain two pounds of sulfate of copper. Doubtless, for many farmers it will be more convenient to measure out two gallons of this liquid and add it to twenty-three gallons of water and then combine a like proportion of the lime water for each fifty gallons desired.

ESSENTIALS OF SUCCESS.

1. Spraying materials should be properly compounded.
 2. The spray should be applied at the right time.
 3. The solution should be applied with such power as to create a fine misty spray.
- E. F. STEPHENS.
Crete, Neb.

The late Dr. Dashiell was fond of telling the following story on himself. "Preaching on one occasion at his old home, an old colored man who had taken care of him when he was a child was delighted with the sermon. At the close of the service he shook the doctor warmly by the hand, and said: 'Larry, you's a good preacher, you's a good preacher. I tell you, you's a soundin' brass and tinklin' cymbal.' Of the same sort was the colored woman's compliment to the cultured and affable Bishop Galloway. She said, 'Brother Galloway always do preach a powerful good tex'."

Feeding Cattle for Market.

R. J. KINZER, ANIMAL HUSBANDRY DEPARTMENT, KANSAS STATE AGRICULTURAL COLLEGE, AT THE KANSAS IMPROVED-STOCK BREEDERS' ANNUAL MEETING, JANUARY 8-10, 1906.

The world's greatest problem is now and always has been its food supply. Wheat, or its products, is the great staff of life among the cereals, and beef is man's staff of life among the meats. In the United States we consume something like 14,000,000 tons of grain as human food and about 6,000,000 tons of beef annually. The amount of beef consumed annually by each person in the United States amounts to about 150 pounds. Thus we see that the problem of furnishing beef for our own people is by no means a small one, to say nothing of our export trade.

To be a successful cattle-feeder requires something more than muscular exertion. What to feed, how to feed, and when to feed are all questions that must be settled or the profits will not be burdensome; no matter how carefully a man may feed or how well he may prepare his feeds, unless he has the right kind of cattle his profits are not going to be great. Therefore, one of the first essentials in the profitable production of good beef is a thorough and clear conception of what constitutes a good feeder. A scrub Jersey or Holstein steer may make as many pounds of gain from a bushel of corn as a Shorthorn, Hereford, or Angus, but in the first case you are producing a cheap grade of beef, while with the steer of a good beef type and a good feeder, every pound of gain is worth from one to three cents more than that of the scrub. And there is certainly much more pleasure in feeding a good hunch of cattle than in feeding a poor one.

As to what time of year is the best to feed is a question on which feeders differ greatly. Many of our largest cattle-feeders claim they can not afford to feed during the winter months, as it requires more feed per pound of gain. And then the question of shelter and yards is also important. If cattle are expected to gain well and be profitable, they must be kept comfortable, but this can not be done in a small, muddy yard where only poor shelter has been provided. This is a subject on which there is much difference of opinion. The stockmen of the New England States give more attention to the care of their beasts than the farmers of the Mississippi Valley; and the farmers of the Mississippi Valley spend more time in caring for their stock than the ranchmen of the West; and our Scotch and English friends give more attention to the care and comfort of their animals than all three of these classes just mentioned. And we Americans go over there and pay them good prices for thus caring for their cattle, and then wonder why we can't raise as good cattle in America as they do in England or Scotland.

Perhaps you will say this has little to do with the fattening of cattle. Perhaps it has; but to produce the best carcass of beef the most economically the beast that is to produce it must be started aright, and this can not be done unless his ancestors have been properly cared for and fed.

So, first of all, look to the comfort of the breeding herd. The general health of the herd needs consideration.

DIPPING BOGS AND CATTLE IN KANSAS.

Professor R. J. Kinzer, head of the Animal Husbandry Department of the Kansas Agricultural College, writes: "We have used Zenoleum exclusively as a dip and disinfectant for our hogs, sheep and barns during the past season, with the best of results in all cases, and can give it a most hearty endorsement." You can get Zenoleum of the Zenner Disinfectant Company, 61 Lafayette Ave., Detroit, Mich. It only costs \$1.50 per gallon, express paid. "The Zenoleum Veterinary Adviser" can be had free on application. We urge you to write for it.

also the rearing of the calves with the least cost or drain to the parent's system, and the maintenance of maximum vigor in the herd. On the other hand, overcare is as detrimental as the lack of care. A life of ease, comfort, luxury, and freedom from exertion will lead to a low condition of the system. Treat the breeding herd in such a way as to produce strong and active calves. Give them plenty of good, clean feed, ample shelter, plenty of sunshine, and plenty of exercise, but do not pamper until they degenerate. The results of an experiment some years ago at our own experiment station show that there was a saving of twelve per cent in the cost of feed on steers well cared for as compared with those that had but poor shelter and care. The life of a beef animal is intended to be a short one, and the aim of the owner should be to crowd to maturity and market at as early an age as possible. What is more miserable to look upon than a herd of wet, cold, poorly-fed, and poorly-sheltered, shivering cattle, standing as close together as possible, for protection from the blasts of a storm, with their heads on the ground and their tails to the storm? Such exposure not only will exhaust the vitality of the best of beasts, but it is cruelty and an extravagant waste of feed.

What we want in our fattening cattle is maximum weight at a minimum cost. And under cost consider the length of time which they are to be fed, the amount and kind of feed which they are to consume, and the value of the yards or pasture which they are to occupy.

The price of land has increased; feeds are too high in price and the price of cattle is too low for us to make it a profitable business to feed as was the method fifty years ago. Cheap pasture lands and the free range are almost a thing of the past, and our cattle now must be turned to market at an early age. Grass is the most natural feed for cattle, and it is hard to get any combination of feeds that will equal it for cheapness of gains. Summer feeding on grass is preferred by many to winter feeding. One of the largest cattle-feeders that ever operated in this country said that he could not afford to feed during the winter months. But the average farmer has considerable more time to do feeding during the winter months than he has in the summer; and this is perhaps why we find so many feeding in the winter. I was unable to find figures giving a comparison of the relative cost of summer and winter feeding; but the averages of 100 experiments with hogs in winter and 99 in summer show a saving of 11 per cent in favor of summer feeding. A great many who summer-feed find cottonseed cake about as economical as any feed to use in connection with grass. Cottonseed-meal or cake will produce fat as fast as any feed we have, but the price of this product is hardly in keeping with the price of fat cattle, and there is some objection to it on account of its sometimes causing sickness, or what is called cottonseed poison; however, this is seldom seen when cattle are on pasture. If used for dry-lot feeding it should not be fed for too long a period or in too large quantities.

Corn will perhaps ever hold its place as the chief feed for fattening cattle, and it is safe feed for either grass or dry-lot feeding. When feeding on grass, soaked shelled corn can often be used to advantage. By using a wagon tank, soaking is a cheaper operation than grinding, and experiments show that there is a saving of 15 per cent in favor of soaked corn as compared with whole shelled corn, and about 5 per cent can be saved by soaking where there are hogs to follow the steers. Ground corn is always preferable to whole corn where the expense of grinding is not too great. Corn-and-cob meal in nearly all experiments has proven about equal to corn-meal as feed for steers. This gives fourteen pounds more feed per bushel of corn, but the expense of grinding is considerably more with the corn-and-cob meal than with corn-meal.

When the price will permit, bran may often be used to advantage. Steers fed on bran and hay by the Pillsbury A mills, of Minneapolis, made an average daily gain of nearly two pounds per day for a period of four months. Two or three pounds of bran, fed in connection with corn-meal, will often prove a valuable addition to their ration.

Oil-meal has long been used as a food for fattening cattle, and with good results in most cases, when fed in connection with corn, but it is a too highly concentrated, nitrogenous food to be fed alone with profit. At the Kansas station it required 732 pounds of oil-

Farmers Say**SLOAN'S LINIMENT**

**Is the Best Remedy on Earth.

The Continuous Stay

is what gives Advance Fence its superior strength. Our stay wire is never cut, but is woven into the margin cables from one stay to the next—continuously up and down for many rods without an end. Thus all the strength of the wire is retained for service—not wasted—as in cut stay fences. This is really the only correct way to weave a fence, but it requires complicated machinery and is a little slower—but when you consider the difference in results, its worth while—it produces a fence about twice as strong with the same wire.

30 Days Free Trial. Place your order with us for what fence you need and try it. If after 30 days you would rather have your money back, just return the fence to us at our expense and you shall have your money by return mail.

We Prepay Freight on 40 rods or more and guarantee the safe delivery of your shipment by the R. R. Co.

PATENTS.

J. A. ROSEN, PATENT ATTORNEY
418 Kansas Avenue, Topeka, Kansas

meal and 814 pounds of hay to produce a hundred pounds of gain. At the present prices this would make a hundred pounds of gain cost about fourteen dollars.

In our feeding experiments we have been unable to find any combination of feeds that will equal corn-and-cob meal and good alfalfa hay; and at the present prices of the various by-products, we doubt if there is much economy in feeding any of them.

Last winter at the Kansas station, with 2-year-old Shorthorn steers fed 219 days, it required 612 pounds of alfalfa and 690 pounds of corn-and-cob meal to produce a hundred pounds of gain, and the cost of gain was six and a half cents per pound.

One mistake that is sometimes made is turning on pasture, steers that have been heavily grained during the winter. This is usually a losing operation, and the more radical the change from the dry lot to the pasture the greater will be the loss. The increase in the cost of gains as the age of the steer increases and as the length of the fattening period increases are factors that must not be overlooked. We find that it takes all the way from 400 to 1,500 pounds of feed to produce a hundred pounds of gain, the amount depending on the kinds of feed used and the length of the feeding period.

From a fat-stock-show record, the cost of gain is given as \$4.03 for calves, \$7.98 for yearlings, and \$12.54 for 2-year-olds. The amount of grain required per hundred pounds of gain increases about 10 per cent after 60 days, 15 per cent after 90 days, and 20 per cent after 120 days.

With the most careful feeding and the very best care, we can not hope to produce the highest class carcass of meat unless we have the right kind of a machine for the changing of our farm products to beef, and we must all concede that "blood tells" in beef production as much as anywhere.

Kansas is producing good cattle, and she can produce still better ones by using a little better blood, by giving the old cow a little better feed and a little better shelter.

DISCUSSION.

Mr. Martin: There is one question I would like to ask that is agitating the farmers some; that is the subject of summer feeding and winter feeding. Now, in making up this statement, was the price of grazing land taken into consideration in summer feeding against winter feeding?

Professor Kinzer: Certainly; this considered the whole feeding question.

S. C. Hanna: In this connection, I wish to inquire of Professor Kinzer if he has noticed Mumford's report from the Illinois Experiment Station? That experiment demonstrated (at least my conclusions were) that the cheapest possible beef gains were from broken car corn and clover hay (I believe they had no alfalfa) and a moderate amount of oil-meal.

Professor Kinzer: The results are contradictory to those from experiments in recent years. Ensilage ranks with corn and corn-meal and corn-and-cob meal in producing rapid gains in fattening cattle. Corn-meal and corn-and-cob meal seem to be of about equal efficiency in producing quick finish. In this test more rapid gains were secured with whole than with shelled corn, and equally as good as with meal. A reasonably quick finish may be secured without the feeding of an extremely heavy grain-ration. Where conditions are such as prevailed in this experiment, corn-and-cob meal is not so valuable for fattening steers. The presence of cob in ground corn does not materially increase the efficiency. Whether or not cattle-feeders should use ground meal or corn-and-cob meal largely is a matter of convenience.

Mr. Elmer: I heard the professor say something about silage being equal to corn. Does that mean pound for pound?

Professor Kinzer: Silage ranks with ear corn and corn-and-cob meal in its ability to make rapid gains in fattening cattle. Last winter at the station we fed a bunch of steers on ensilage; that is, we supplied ensilage in place of corn as far as we could, and we did not find it to make any cheaper ration than feeding straight corn and alfalfa.

Mr. Elmer: Have you any figures for feeding snapping corn

Professor Kinzer: No, I have not.

J. C. Robison: The gentleman spoke of feeding ear corn. We have been experimenting a little this fall in that respect—not with cattle, but trying to make flesh on horses, and we have been experimenting with a bunch of fifty 2-year-old stallions, part outside and part inside of the barn. Those on the outside we began feeding snapping corn and alfalfa hay, and they are still get-

ting ear corn, and they have gained two pounds per day; and those we had in the barn, on ground corn and oats and bran, with not to exceed one pound of oil-meal, are gaining close to four pounds a day; and we find that we can put a pound of meat on colts outside for just about half the cost of those inside the barn.

J. W. Robison: You see in that experiment the object in the outside horses is to grow them up to a point where they are ready to take on flesh. The ones in the barn have reached that point and are taking on flesh. They get no very increased quantity or quality of feed, but they get currying, and they get bedding, and the best possible care to put finish on them. In speaking of the quality of the two lots, I think it is safe to say that nobody ever comes and buys a colt out of the pasture. It's hair is rough; it is not as ambitious. It appears that no man is good enough judge of a horse to buy a horse that is not put in good condition in competition with one that is. Now, as to those experiments that are given from Illinois: nobody disputes the truth of any bulletin that Mumford sends out; but we don't know the condition of the silage; it is not told what it is composed of. There is silage, and there is silage again. I find when I feed cattle cobs, unless they are ground extremely fine, that you can pick up little particles of cob practically undigested. It may be said that it lightens up the food and aids digestion, getting the nutrient out of the corn better. That would be very good if there was no better way of doing that. A little bran, a little chopped hay, a little alfalfa, makes a very good thing to lighten up the corn-meal and not let it lie in a dough state on the stomach. About the best place I know of to run corn-cobs through is a cook-stove, with a good piece of beefsteak on top of the stove. If we have to feed cobs, they should be run through the grinder first. The question was broached here about feeding on grass. I have fed from 150 to 200 cattle on a pasture every summer with grass and corn. We take those cattle out of stock-cattle, some of the most mature, and about March 1, I turn them out on that grass pasture and, in place of the half-bushel of corn that we gave them in the dry lot, give them about a peck. About four years ago, when corn was worth seventy-five cents a bushel and wheat hardly as much, we fed them wheat, because there were four pounds more of wheat in the bushel. We put cottonseed-meal with all of it. Now, the corn is not much more than half the price of cottonseed-meal. Corn with us is worth thirty-five cents; so you see the price of the two kinds of feed—of all kinds of feed—should be a large factor in determining the quantity of each kind that the animal should consume to reduce the cost to the minimum. The best feed is pure grass because it is cheapest—with this peck of corn or an equivalent and oil-meal. Hogs follow, and we make nearly three pounds of beef and one of pork out of every bushel of corn; that is, feeding for several years it runs something near that—sometimes exceeds it, sometimes runs a little below.

President Potter: Did you ever select a bunch of cattle as you selected these and put them on grass alone and see what they would do?

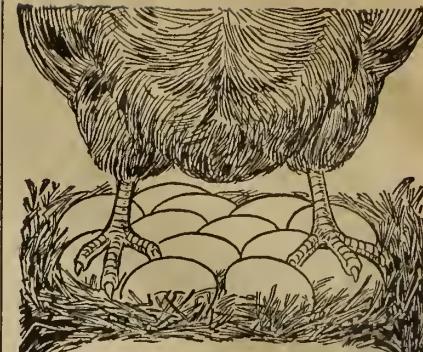

J. W. Robison: It will vary some; we do not always take the best cattle, but we take the most-matured ones. I think that a fair sample of the different kinds of cattle as to taking on flesh.

C. E. Westbrook: I would like to say one word to you farmers in particular in regard to Mr. Robison's talk—in regard to feeding those colts. The colts get a very much better growth—make more useful horses and get more muscle—when outside than they do when kept in the barn. This mere laying on of flesh on horses is not the valuable stuff for us, particularly in Kansas. As Mr. Robison said, people do not buy on their judgment as they do on looks.

Mr. Blair: A point of vital importance has been touched upon, and that is the matter of breeding stock. Whether it is best to bring them up outdoors on bran and muscle-producing feed, or indoors; whether it is the best way to let them rough it a little, or keep them up and feed them well and make them mature early, and keep them plump and so they will hold their heads up well. It is my opinion that it is the very best feeder that makes the very best breeder.

Mr. Westbrook: There isn't a horse in his stall, unless he has been abused, but what will go out and exercise. You must give them liberty.

J. W. Robison: I did not think that it needed explanation about the bene-

A Setting Hen

would not be annoyed to death with lice if Instant Louse Killer was sprinkled over the hen and into the nest. She cannot get away; the lice feast happily on the feathered martyr to maternal instinct.

INSTANT LOUSE KILLER

(Powder or Liquid)

will make the setting hen and all her children happy. It destroys lice on poultry stock and ticks on sheep. It kills bugs on cucumber, squash and melon vines, cabbage worms, slugs on rose bushes, etc. Instant Louse Killer is the original powder louse killer put up in round cans with perforated top. Be sure of the word "Instant" on the can—it has twenty-five imitations. If you will sprinkle Instant Louse Killer on the setting hen and nest, we will guarantee the brood will come off free from lice; it is also a reliable disinfectant and deodorizer.

SPREADING TEST 30 DAYS

FREE

YOU can use this American Manure Spreader a month **FREE** to prove it is as represented. Upon receipt of your order, we will ship the Spreader promptly and *prepay the freight*. Use it 30 days on your farm. If you don't find it all we claim—send it back at our expense. *The test won't cost you a cent.*

We make you this offer because we know what the American Manure Spreader will do. **We know it will Pay for Itself.**

You get this unusual opportunity because we make more high grade Manure Spreaders than any other concern in the world.

That's why we can give you this chance to test our Spreader in your own way in your own fields.

American Manure Spreaders are made right.

We are old established manufacturers. We buy everything in big quantities. Thus we always get the very best at rock bottom prices.

Our men are experienced. They have been building Manure Spreaders for many years.

This means the best possible machines at the lowest possible cost.

We sell *direct to you* because we are able to give you much better value for your money and a better understanding of the machine than any one else could. We always keep in close touch with our customers. They tell us just what our Spreaders are doing, and we keep the standard of our machines so that every penny you pay us comes back to you in full Manure Spreader value. *We do not belong to any Trust or Combination. We are an entirely Independent Concern.*

The American Manure Spreader of today represents the highest development in Agricultural Implements building.

It is absolutely modern and up-to-date.

It is a sensibly and practically built machine.

Nothing about it is exposed to unnecessary strain. There is no complicated mechanism to get out of order. Every part is made extra strong and all are substantially put together.

The American Manure Spreader doubles the value of every bit of manure you put on your land. It breaks up and pulverizes it thoroughly. The distribution is uniform. Every foot of your land gets its share, and the manure is in such shape that it mixes easily with the soil.

After using the Spreader **A Month FREE**, you can take time to pay for it.

It may earn its cost before you remit us any money.

Send for particulars of our generous proposition today.

You will be well pleased if you do.

If you tell us the number of acres you cultivate, and how many horses, cattle, sheep and hogs you keep, we can give you the Government statistics as to value of your manure crop.

Write to us today. Do it now!—before the matter has a chance to slip your memory. Address—

AMERICAN HARROW CO.

Detroit, Mich.

nt of action in a horse. A horse is not like Mr. Kirkpatrick's hog, which is merely laying on so much flesh. No horse can develop speed and action without having room to practice. Now, no colt, be he draft or any other breed, can develop that straightaway action unless he has opportunity to practice it. We are not trying to finish those colts out there. We do not want to finish them down; we do not want them too fat; so we just keep them in that pasture until they are thrifty. We often give them bran and oats and a little forage, to assist in making the bone and blood, and muscle.

Mr. Keats: I would like to ask Mr. Robison how he expects to make the most clear money out of the feed?

J. W. Robison: As I said, I think we never sold a colt out of the pasture. His hair is rough and thick and he is not kept up. They are all one class of horses coming right up. We take the most mature ones and the ones ready for market and put them in the barn and finish them, and the profits come in both bunches. We never want to put a horse on the market unless he is conditioned up and fit for sale, just as a good cattle feeder will condition his cattle. The money comes out of the ones in the barn.

Secretary Heath: Last year on this subject we had quite a discussion—an extra-good paper by E. B. Mitchell, who is manager of the Tebo Lawn Shorthorns, one of the greatest show herds in this country—and he summarized this question briefly. He said:

"We, as improved-cattle breeders, are supposed to be manufacturing beef by the improved method, and I firmly believe that the feeding qualities of even pure-bred cattle can and will be endangered by the overindulgence of the idea that fat cattle will not breed. How frequently we see very promising animals pass through a sale ring whose misfortune it is to fall into the hands of some misguided victim of this teaching, and for lack of proper care pass forever into oblivion! Is it not a fact that an animal worth owning is deserving of good care? If we were to take an invoice of our pure-bred herds, I am sorry to say that we should find some that have become impoverished for lack of sufficient foodstuffs to develop the young things into the massive, broad-backed animals of which we read, and to which we point with pride. That this is a vital point in the future of the pure-bred cattle business there is no doubt in my mind. Every home of pure-bred cattle should be a living example of these higher ideals and a school of instruction to the novice. And now, for fear of being misunderstood in this connection, I wish to say that good keep does not necessarily mean show-yard form, and yet I firmly believe that the more this is cultivated the more inherent the fleshing qualities become. Prices on pure-bred sires are now within the reach of all, and let us breeders put forth every effort to make the contrast of individual merit between the pure-bred and the scrub greater than ever before, at the same time placing ourselves in position to say, as would the Jewish vendor, 'He has dirt sheep. You never got so much for your monies!'"

Professor Kinzer: It makes no difference whether raising horses or cattle, the most essential thing is plenty of sunshine and plenty of exercise. Do not feed your animals too much corn and give them some alfalfa. Now, as to the feeding indoors and outdoors: we find that in nearly all cattle experiments gains can be made a little more economically when fed inside. Good open sheds will make larger average gains, but the gains will be a little cheaper inside than out. As to the cost of grinding, we find it costs twice as much, or a little more, to grind cob-meal than it does to grind straight corn-meal. Professor Mumford's statements are rather contradictory to this. Bran is better than cob, but when you can get the cob for the grinding I think it the more economical than to use bran.

The Brown County Breeders' Short-horn Sale.

Under the efficient management of Everett Hayes, of Hiawatha, the Brown County Improved Stock-Breeders' Association held its first annual sale at Hiawatha, Kans., on Thursday, April 19. This was a combination sale made up of animals selected from the herds of G. Y. Johnson, Willits; T. J. Sands, Robinson, Everett Hayes, Hiawatha; John McCoy, Sabetha; Jas. P. Lahr, Sabetha; Ed. Schuler, Falls City, Neb.; A. F. Robinson, Morrill; Bert G. Wise, Reserve; Geo. Mannville, Faustette, Mo.; and W. W. Brown, Weston, Mo.

The animals were in good shape generally and the sale was a lively one. Col. Geo. Bellows, of Maryville, Mo., was at his best and conducted the sale in the most satisfactory manner. He kept the crowd in a good humor by his ready wit and spirited manner of handling the business and got every dol-

lar the cattle were worth in most cases. Owing to the large number sold there were of course many bargains, but both the consignors and purchasers seemed well pleased with the results. The crowd in attendance was a large one, and was composed of farmers from the country adjacent to Hiawatha with the exception of a few from a greater distance. Most of the stock was sold to local buyers and the sale may be regarded as a great missionary effort which will insure a permanency of the Shorthorn breed and the success of future sales by this association.

Fifty head of cattle were sold, though only 48 of these were included in the catalogue. Of those catalogued 30 were females which brought \$2,270, an average of \$75.66. The 18 bulls brought \$1,667.50, average \$92.64. The 48 catalogued animals sold for \$3,937.50, average, \$82.03.

From these figures it will be seen that the demand for bulls was fairly good, while the females did not sell so well. It should also be stated that there were a good many young animals in the offering which served to reduce the average.

In addition to the animals catalogued, there were two bulls sold for \$85 and \$87.50 respectively. These are not included in the averages given.

Animals bringing \$100 or more sold as follows: Lady Alexandrian 5th, W. E. Smith, Baker, \$132.50; Hannibal's Beauty, Leo Deuhn, Leona, \$130; Nancy Belle, Ray Callan, Hiawatha, \$105; Lyda, John McCoy, Sabetha, \$160; Benson, N. B. Hanson, Willits, \$130; Lilly, T. J. Sands, Robinson, \$100; Scottish Hero, W. P. Lair & Son, Horton, \$175; Loudon Duke 234108, E. T. Byers, Hiawatha, \$120; Maid's Lad 243874, A. R. Walters, Baker, \$115; Prides Model 242486, T. J. Whelan, Mayetta, \$140; Baron Mysie 176261, Geo. Mannville, Faustette, Mo., \$150.

Other buyers were W. B. Fordyce, Powhatan; Boyd Overfield, Hiawatha; John Hall, Powhatan; A. B. Vandyke, Sabetha; E. D. Ludwig, Sabetha; J. N. Richards, Hiawatha; Phil Mahoney, Reserve; C. D. Havens, Mayetta; Stephen John, Hiawatha; Jackson Hart, Hiawatha; A. A. Hoverson, Troy; A. F. Robinson, Morrill; Louis Kenistada, Home; J. W. Field, Hiawatha; Ira McCoy, Sabetha; David Davis, Hiawatha; J. F. Reeler, Hiawatha; S. W. Round, Hiawatha; T. J. Dawee, Troy; Finley McCray, Baker; T. S. Wise, Reserve; J. C. Berry, Hiawatha; W. W. Brown, Weston, Mo.; N. B. Hanson, Willits; Hans Torkelson, Hiawatha; M. A. Murphy, Willits; Frank Van Dolsen, Fairview; J. O. Hetler, Hiawatha.

Arrangements have been made for a second sale to be held this fall, probably in November.

Allen's Pure Scotch Shorthorn Sale.

It has been a revelation to many Shorthorn breeders in the West, to know that Geo. Allen, of Lexington, Neb., has so many well-bred Scotch cattle, and to learn that he will make a public sale May 1, of nearly 50 head at the South Omaha sale pavilion. Mr. Allen reports eight calves dropped by the young cows booked for this sale and there will be others before May 1. There has been an unusually large demand for sale catalogs, which shows a wide and growing interest in straight Scotch breeding such as is found in Mr. Allen's consignment to this sale. The sale catalog shows the breeding of this lot of cattle, giving the names of the breeders of the dams, as well as of the sires so that one can see for himself how richly these cattle are bred and tell what is meant by straight Cruickshank breeding. The entire offering is a select lot and will enter the sale ring in prime condition, affording an opportunity to get foundation stock, herd-headers and prize-winners that should not be neglected by the enterprising and successful breeder. In the advertisement in this issue, note the breeding of the two young bulls; No. 8, Barnpton Duke 2d is a very fine young bull of pure Scotch breeding, belonging to that grand old family, known as Barnpton Butterflies. No family of cattle stood higher in Mr. Cruickshank's estimation. Barnpton Flower in this pedigree was the dam of the great breeding bull, Barnpton 37763, that sired Earl of Aberdeen, Baron Victor, Spartan Hero, and others, to which is largely due the popularity of the Cruickshank cattle of to-day. No. 14, Lucky Boy, is likewise a richly bred Scotch. The helper

No. 29, is a choice bred Cruickshank Matchless, and so we might go on analyzing the breeding of nearly every animal booked for the sale, but it is better that the reader interested do this himself and then make up his mind to attend the sale.

Sedalia Shorthorn Sale.

The dedication cattle sale in the new Live Stock Show pavilion, Missouri State Fair Grounds, being a combination Shorthorn sale held April 20, again demonstrated the fact that fine weather is not always favorable to a public sale—the preceding few days of nice weather had caused the "spring work fever" to attack every farmer within reach, and it would have been a masterful attraction that could coax them away from their work, hence the attendance was not so large as was expected or as the occasion warranted. Breeders were present from many parts of the State, and they heartily echoed the sentiment expressed by Colonel Harriman in his speech opening the sale, when he said that the stockmen and farmers of Missouri are to be congratulated upon having provided for their use so magnificent a structure as the great new show pavilion, and they are under lasting obligations to the enterprise and liberality of the State Fair Board for having furnished it. Colonel Harriman was in fine mettle and his address was an eloquent tribute to improved live stock, to good cattle, to the progressive enterprise of the men who have given to Missouri her splendid reputation among the breeders of America and to the well-known breeders who had consigned stock to this sale. He did all of the block work, and was ably assisted by Cols. C. J. Hieronymous and S. W. Kidd in the ring.

The offering was composed largely of young stuff and many of the animals were too thin in flesh, hence the average given in the summary—while not what the quality of the stock warranted—were considered good by experienced stockmen present. This sale emphatically demonstrated the fact that Sedalia is to be a public sale center for pure-bred stock—with a more favorable time and the stock more carefully fitted, the averages will rank up with the best sales in the country.

Besides the contributors and the buyers mentioned below, the following named prominent stockmen from a distance were present: Chenault Todd, Fayette, Mo.; Col. John D. Snyder, Winfield, Kans.; Messrs. Harris & McMahen, Lamme, Mo.; John Koonts, Cartage; Arthur Rhys, Cartage; R. B. Wornall, Kansas City; L. M. Monsees, Smithson; Chas. F. Wadeigh, Green Ridge; E. B. Mitchell, Clinton; R. K. Thompson, Beaman; S. W. Roberts, Pleasant Green; G. P. Grimes, Madision; T. H. Carskadon, Dalton; G. M. Bowlers, Paris; D. W. Byrne, Keytesville; H. J. Maddox, Plad; Dan Donnouhie, Appleton City; A. M. Hillas, Hughesville; Ed. Patterson, Buncombe.

The sale was under the management of Chas. R. Gentry, Sedalia, Mo.

Following is a summary of the sale:

8 bulls averaged.....\$128.12

13 females averaged.....86.50

21 head, general av.....102.40

A detailed report of the sale follows:

C. E. LEONARD & SON'S CONSIGNMENT.

1. Cow, Dr. O. L. Kerr, Independence, Mo.\$200.00

2. Cow, John Welch, Mussel Fork, Mo.100.00

3. Cow, Dr. O. L. Kerr.100.00

4. Bull, J. P. Newell, Cartage, Mo.295.00

5. Bull, W. H. Rissler, Lamotte, Mo.75.00

N. H. GENTRY'S CONSIGNMENT.

6. Bull, Henry Hanb, Whiting, Kans.\$130.00

7. Bull, Henry Shuster, Sedalia, Mo.65.00

8. John D. Crawford, Sedalia, Mo.87.50

HARRIMAN BROS. CONSIGNMENT.

9. Bull, Dr. O. L. Kerr.\$162.50

10. Dr. H. K. Givens, Fayette, Mo.110.00

JUNO K. KING'S CONSIGNMENT.

11. Cow, Walter Morey, Sedalia, Mo.\$62.50

12. Cow, Dr. O. L. Kerr.85.00

GENTRY BROS.' CONSIGNMENT.

13. Cow, Dr. O. L. Kerr.\$72.50

14. Cow, McFarland Bros., Sedalia, Mo.70.00

24. Cow, Dr. O. L. Kerr.	125.00
25. Cow, Dr. O. L. Kerr.	57.50
27. Cow, Dr. O. L. Kerr.	77.50
28. Dr. O. L. Kerr.	47.50
30. Cow, J. F. Butterworth, Sedalia, Mo.	62.50
32. Cow, Dr. O. L. Kerr.	105.00
33. Cow, W. H. Rissler.	70.00

A New Record for Shorthorns.

The pure-bred Shorthorn cow, "Florance Airdrie 6th", owned by the Nebraska Experiment Station, has just the present her milk and butter records which is a leader for cows of this breed. She produced between April 7, 1905, and April 7, 1906, 10,487 pounds milk, 413.01 pounds of butter-fat, and 481.84 pounds of butter. Her average test was 3.94, and she was with calf during the last six months of her lactation.

Florence was purchased from Mr. William Ernst, of Tecumseh, Neb., on April 20, 1903, and from that date to the present her milk and butter records are as follows:

Year	Milk	Butterfat	Butter
1903.	7537.5	358.51	418.26
1904.	7112.5	316.03	368.70
1905.	10487.0	413.01	481.84

Total 3 yrs. 25137.0 1087.55 1268.80

Average for 3 years. 8379.0 362.51 422.93

She was born June 20, 1898, being now about eight years old and in her prime. If she retains her normal condition, she will, no doubt, produce a still larger record next year. During the three years she has dropped three bull calves and is due to freshen again in July of this year.

The Square Deal Poland-Chinas.

Mr. Wm. D. Calder, owner of the Square Deal Stock Farm at Bancroft, Kans., has just added a new herd boar that ought to prove a coker. This is Calder's Chief by Garver's Choice by Kansas Chief, the boar that became famous as the head of C. M. Garver's herd at Abilene. There is not enough of Kansas Chief's blood among the Poland-China herds of the West, and we are glad to know that Mr. Calder has secured one of his best grandsons as herd-boar. Later Mr. Calder will have some litters in his pens by this young boar, and it will pay to keep an eye on them.

Mr. Calder has for sale now good young boars that ought to make money for some one. They were sired by Square Deal 36749 and out of Daisy Calder 87343, who is a daughter of Calder's Perfection 33581, a great grandson of old Chief Perfection 2d. Daisy Calder's dam was Black Beauty 73707 by Shawnee Chief 23502. That pedigree is good enough for any one. The advertising card of The Square Deal Stock Farm is on page 478.

Mall Bids at Public Sales.

It is a matter of surprise and wonder that the small breeders and farmers do not take more interest in the public sales of pure-bred hogs now being held in various parts of this and other States. Now is the time when herd-headers are needed and if the farmer finds it impossible to attend any of these sales he can always send his bid by mail. A small bid placed in the hands of a competent auctioneer or fieldman will sometimes secure a choice animal at a bargain.

One of THE KANSAS FARMER fieldmen recently carried to a sale of pure-bred hogs a limit bid of \$30 for a boar. His instructions were to use his best judgment and secure a hog worth the money. He was able, through his experience, to fill this order for \$19, for which price he secured the best boar pig in the entire offering, though many sold for double that sum or nearly so.

A competent auctioneer or a qualified fieldman is, in very many cases, better able to select good animals and to pick out the bargains than is the farmer who is less familiar with such matters. A small bid in good hands is often and practically as good as a personal bid in securing good animals at public sales.

Hebrew's Hog Sale.

One of the successful hog sales held this spring was that of J. A. Hebrew of Stockton, Kans. Mr. Hebrew is one of the substantial farmers of Rooks County. He has

CONDUCTED BY RUTH COWGILL.

The Heart of the Hills.

There's a wonderful country lying
Far off from the noisy town,
Where the wind flower swings,
And the song-bird sings,
And the tumbling brooks come down—
'Tis a land of light and of laughter,
Where peace all the woodland fills;
'Tis the land that lies
'Neath the summer skies
In the heart of the happy hills.

The road to that wonderful country
Leads out from the gates of care;
And the tired feet
In the dusty street
Are longing to enter there;
And a voice from that land is calling,
In the rush of a thousand rills—
"Come away, away,
To the woods to-day.
To the heart of the happy hills."

Far away in that wonderful country,
Where the skies have deepest hue,
In the shadows cool,
By the foaming pool,
We may put on strength anew;
We may drink from the magic foun-
tains
Where the wine of life distills;
And never a care
Shall find us there,
In the heart of the happy hills.

—Boston Transcript.

The Two Pictures.

I have before me two pictures, one "the Shepherdess" by Millet. She is a peasant girl watching her sheep. She stands, hooded and cloaked, her crook leaning against her while her eyes are bent upon the knitting that her hands are doing. Her whole attitude portrays anything but joy. The countenance is sad and dejected. She sees not the beauty all around her. She is probably bemoaning her hard lot. She is not typical of toil, but of drudgery. The other picture is "The Song of the Lark" by Breton. It also is a picture of a peasant girl. She has her sickle in her hand going forth to reap in the field. She is a strong, joyous country girl listening to the song of the lark. Her head is up and her whole attitude bespeaks a happy, contented spirit. This picture makes me think of work, the work that makes one happier, better, and healthier. This is not drudgery. Work is one of the greatest blessings to mankind. The men and women who have health and ability to push their work before them and see it move in order and system ought to be the happiest people on earth. Work is noble and was ordained of God. Drudgery is slaving, and work becomes such when it is irksome and one is driven to it. Housework is both healthful and pleasant if done with moderation, taking time to enjoy the beautiful things as they come along. The first picture spoken of represents the busy woman who needs to do two things at once. While she tends the sheep she must knit—but knitting may be done without keeping the eyes constantly upon it. She might see the beauty around her and enjoy God's sunshine, thanking Him for health and ability to do what she must instead of repining her hard lot. Life is indeed to a great extent what we make it, and after all, happiness does not depend so much upon circumstances. It comes from within. It is one of woman's duties and privileges to be happy and cheerful, but if she were dependent entirely upon outside circumstances it would often be a difficult of attainment.

In the routine of housework it is hard not to bury one's self in the work, to be so absorbed with it all that one is lost to everything else and half the joy of life is lost. I know there are the three meals a day to be prepared, dishes to be washed, sweeping and dusting and a thousand and one other "little things," and then there is the ever present sewing to be done. John and Mary and Jack and Jane must have clothes. But while these things are to be done let us take them up one at a time as if each were the only thing, taking time as the day glides along to enjoy everything that comes along. Like the young girl in the second picture, let us go about our work with a song in the heart and a light in the eye and be master of the situation and "not like dumb driven cattle." The only way to enjoy life is to get pleasure every hour as we pass along. We go this way but once. Like the busy bee, let us take the sweets as we come to them from the thistle blossom as well as from the rose. Many make the mistake of living in the future thinking when the children are grown up they will have time for this or that, or when the mortgage is paid off, or the quarter section is paid for they will take more time to read or enjoy some coveted pleasure. That is a mistake.

Every year brings its duties. It is only a mirage that allures. When the children are around you with their innocent prattle and unaffected love is one of the sweetest times of life. Think not of the bother and care. Enjoy them while you may. Be to them a companion and chum, for the time is fast fleeting when you may enjoy this pleasure, and you can only look back with regret. A contented, satisfied mind is necessary to happiness in one's work. President Roosevelt was buried in the midst of a pile of work when a friend happening in asked him how he could stand such a strain. He answered with a look that showed that he meant it, "Oh, I like my job." That is the secret of his wonderful ability to accomplish so much and his endurance. I think as a rule the country women are the most contented and happy of any, and can say with zest and earnestness, "I like my job." Their environments are such as tend to make them happy. They are away from the hurry and rush of city life and escape many of the complexities of living that come to women who live in the city. They may live the simple life in which is true enjoyment. They can get so close to nature, which is so restful, and to nature's God, which is peace.

What is it then that turns toil into drudgery? It is not hardship. It is not because it is routine and must be repeated over again and again, nor has physical inability anything to do with it. It is because it lacks soul, interest, thought, and love. If our work is drudgery it is because we make it so.

Care of the Teeth.

"A pearl in the mouth is worth two on the neck," is an up-to-date adage which women would do well to ponder over. A woman of many charms will often fail of impression if the teeth are not delicately clean and white.

There are many factors which go to determine the soundness of one's teeth, but none more potent than that of use. Good, vigorous action is necessary in order that a supply of blood may be called to the teeth to nourish them. Give a muscle no exercise and the veriest novice knows it will get soft. Give the teeth no work and they become chalky and an easy prey to decay.

Too much cooking of food and the use of soft, prepared dishes have had much to do with getting people out of the habit of chewing. Those who live on coarse foods requiring thorough mastication have the perfect teeth of animals, white and hard and even. The blood supply is perfect on account of the stimulation given by thorough exercise of the jaws.

The higher the civilization, the worse the teeth. For not only do people eat food which is too greatly refined to require chewing, or soft and mushy from over preparation, but they also eat sweets and condiments, and worst of all, perhaps, they overeat.

"The use of sugar," said a dentist whose reputation is world wide, "is bad in two ways. It not only promotes fermentation in the mouth, but it creates a false taste, which will have to be satisfied with other things equally detrimental and unneeded. And they who eat more food than necessary never can have a naturally cleansed mouth, for the saliva is provided to dissolve perfectly only the food the body needs.

"For the many who do not or can not regulate their habits so that their teeth are kept naturally in good condition, there are many simple helps which do much to counteract any bad tendencies. Cleanse them thoroughly with a plain preparation of chalk and orris root, using tepid water and a stiff brush. This should be done after every meal. At least once a day examine them thoroughly with the aid of a mirror to make sure that they are properly freed from all food particles. When you are having dentistry done, be sure to see that a space is left between the teeth sufficient to allow you to pass dental floss (common sewing silk will do) back and forth to dislodge any food that may get in. A good dentist should see to this, and also that there are no jagged edges to break and cut the silk and prevent its free movement. But the mouths of nine out of every ten people who have had extensive work done show an opposite condition of affairs.

"The necessity for clean teeth at night should be especially borne in

Only \$38 THE GREATEST BARGAIN ON EARTH

KEEP OUR COMPETITORS AWAKE NIGHTS TO TELL HOW WE DO IT.

HAPGOOD PLOW COMPANY, 804 FRONT ST., ALTON, ILL.

mind. This will prevent the growth and development of micro-organisms in the mouth. These are generated most rapidly during sleep, while the person is quiescent. They cause putrefaction and decay of the teeth.

"When teeth require filling they are often acutely sensitive on account of high acidity of the saliva, and very great pain results from any work done on them. This may be largely obviated by the use of an alkaline wash in the mouth for two or three weeks previous to a visit to the dentist. A tiny pinch of common baking soda, bought at a druggist's to insure purity, is dissolved in a quarter of a glass of water and used to rinse the mouth thoroughly night and morning."—New York Tribune.

Laundry Hints.

To Bleach Table Linen.—Javelle water, in peach time of all others, is a necessity. It will take out the old stains in table linen that were overlooked when the clothes were sent to the laundress. Besides this, it will whiten the handkerchiefs yellowed by perspiring faces and hands. To make it, dissolve half a pound of sal-soda in a pint of boiling water. In another dish dissolve a quarter of a pound of chloride of lime in a quart of boiling water. Pour the two together, stir, settle, and turn off the clear liquid, leaving the settings. Keep in a tightly corked jug in a dark closet.—New York Sun.

To Clean Lace.—Baste the lace to a piece of white flannel with short stitches, and as near the edge as possible; then baste across the piece several times each way, and wind the strip of flannel around a smooth glass bottle, stand the bottle or lay it in a warm suds of rain water and some good washing powder, and dip it up and down and about until it looks perfectly clean; then since in warm, clear water and put it out to dry in the sun. I have seen some beautiful Battenburg collars and muslin ties with lace edges washed thus.

To remove a vinegar, wine, or a fruit stain from a white linen cloth, the following will be found effectual: Hold the stained parts in boiling milk and the stains will be found to quickly disappear.

If a spoonful of borax is put into the last water in which white clothes are rinsed, it will whiten them very much. The borax should be dissolved in a little hot water before it is added to the rinsing water.

In washing black muslins and lawns a tablespoonful of turpentine should be

You Will Prosper in the great, growing Southwest

If you purchase a farm in the Southwest now, while the land is cheap, you will soon see grow up around you a community of prosperous, energetic men, who like yourself, have seen the possibilities of the Southwest, and have taken advantage of them. This very condition, which is rapidly forming all over the Southwest, is making the value of land increase rapidly, to the certain profit of those who own it.

There are more and better opportunities for making money—for home building, in the Southwest—along the line of the Missouri, Kansas & Texas Railway to-day, than anywhere else. You have only to get on the ground to prove this. If you are in any way interested in the Southwest, write to-day for a copy of my new paper "The Coming Country."

Go Southwest Now

Take advantage of the homeseekers' rates, April 17th and May 1st and 15th, and go and see the country for yourself. On above dates most lines will sell both one-way and round trip tickets at exceptionally low rates. If your nearest railroad agent can not give you the rates, write me for particulars.

FIFTH TERM JONES' NATIONAL SCHOOL OF Auctioneering and Oratory Davenport, Iowa

6th term opens July 23, 1906. All branches of the work taught. Students now selling in 13 states. For Catalogues write Carey M. Jones, President.

added to each pailful of rinsing water. Use gum arabic water instead of starch for black cottons. This gum arabic water is used to freshen muslins of all colors which have become limp. Sprinkle the gown and turn it wrong side out while drying. Sprinkle with clear water and iron on the wrong side.

A tablespoonful of sal-soda, over which boiling water is poured, is recommended for taking stains off coffee pots. With this treatment no boiling is necessary.

Scraps of soap too small to be used any other way may be saved in a can and cut up and used in the boiling water to boil the clothes.

The state of the irons has much to do with the success of the ironing. When the irons show a tendency toward rusting or black specks, it is time that they are washed in soap suds. Dry them carefully after this washing. Sandpaper is a good thing to have at hand when irons become sticky with starch. Rubbing an iron once or twice across the sandpaper will render it smooth again. If the sandpaper is lacking dry salt on a piece of paper will answer the same purpose. Flatirons should not be left where the steam of cooking can reach them, as that causes them to rust. Always set the irons away on end rather than flat on the shelf. Those which have once been allowed to grow red hot never retain the heat so well afterward.

The Young Folks

Robin.

Rolling Robin is here again, What does he care for the April rain? Care for it? Glad of it! Doesn't he know? That the April rain carries off the snow, And coaxes the leaves to shadow his nest, And washes his pretty red Easter vest, And makes the juice of the cherry sweet, For his hungry little robins to eat? "Ha! ha! ha!" hear the jolly bird laugh, "That isn't the best of the story by half!"

Gentleman Robin, he walks up and down, In orange-tawny and black and brown, Though his eye is so round and his steps so firm, He can always stoop to pick up a worm, With a twist of his head, and a start and a hop. To his robin-wife in the peach-tree top, Chirping his heart out, he calls, "My dear, You don't earn your living! come here! come here!" Ha! ha! ha! Life is lovely and sweet; But what would it be if we'd nothing to eat?"

Robin, Sir Robin, gay red-vested knight, Now you have come to us, summer's in sight. You never dream of the wonders you bring, Visions that follow the flash of your wing. How all the beautiful hy-and-hy Around you and after you seem to fly! Sling on or eat on, as please your mind! Well have you earned every morsel you find. "Aye, ha! ha! ha!" whistled Robin; "My dear, Let us all take our own choice of good cheer."

—Lucy Larcom.

Fleetfoot; the Autobiography of a Pony.

CHAPTER VII.—THE SCHOOLHOUSE BY THE ROAD.

It would be hard to describe the children's delight and pride that September morning, the opening day of school, when I hitched to a rubber-tired buggy, dashed up in front of the little red building with its wide open doors facing the roadside. We were greeted by various kinds of shouts from the large group of children which had congregated in the tidy school-yard. A chorus acclaimed, "Hurrah for the pony! He's a fine racer!" and when Marcella alighted with books and dinner-basket, as many boys as could hang on to any part of the buggy clamored for a ride in our gorgeous outfit.

We started down a lane which wound in and out among tall hedge-trees. Although Lyall was considered a fluent talker at home he now made only a feeble effort to answer the deluge of questions which poured over him. "What is the pony's name? Just Pony! Why didn't you call him Beauty or Quick-step? Can he pace? Who broke him? Does he belong to you or Marcella? Why don't you make him go faster when you know he can? Are you going to buy another like this one? Will you sell this one?" These are only a few of the queries of which I was the subject and I do not know how many times the list would have been doubled had there not come all at once the clear tinkle of a bell, at which signal I was immediately turned in my course and

urged to use my best pace in the direction of the house of knowledge. As I bounded along I could hear the excited conversation of the lads behind me. It seemed that in the panic a couple of the smaller ones were crowded out and fell by the wayside. The others, not having the love-your-neighbor spirit in their hearts just then, did not lose any time in picking them up, but continued to plead with me for a more rapid gait.

"The teacher looks cross and she'll give us the rod before she even knows our names," remarked one little fellow breathlessly, and another answered him quickly, "You bet she won't whip me when she hears my name. My pa's director."

"That don't make any difference," chimed in a third; "she told Uncle Glace that she wasn't goin' to have any picks."

"Did she mean tooth-picks?" was the surprised query from Lyall.

"Oh, no, it's favorites. Director's kids and things like that."

Further comment was prevented for the time being for we were now in the school-yard not very far from the yawning doors, through which filed a decorous row of small girls with short dresses and long braids.

Marcella was among them, and I noticed that as she passed she threw an uneasy glance in our direction. From around the corner at full speed came a dozen or more lads with arms swinging wildly and disheveled heads pushed forward. As great as was their haste, one little chap, still indignant from having been denied a ride, took the opportunity to whisper spitefully to Lyall and his companions, "You'll catch it, smart Alecks, you will!"

Frénzied by this cruel prophecy, the guilty ones flung my lines and hitching strap to the ground and with a few frantic leaps landed on the topmost steps. To their consternation they suddenly encountered the new teacher in the doorway, but instead of fiercely upbraiding them as they had expected, she smiled and put out a detaining hand.

"It isn't quite nine o'clock yet," she said, "and I think you will have time to unhitch the pony. It would be a good plan to take the harness off, too, and pump that bucket full of water at the well. The little thing will need a drink. How very warm it looks!"

One of the boys answered a husky, "Yes, ma'am," and Lyall was so much relieved that I don't believe he knew what he said when he exclaimed, "Thank you very much." Those two then took me in charge and while they relieved me of the harness, and placing it in the buggy, backed the vehicle under the shade of a near-by tree, they recovered their self-possession almost to the extent of bravado. Neither one, according to his own statement, had been in the least afraid of the new teacher but had pretended to be in order to frighten each other and the "kids" (the euphonious name by which the younger pupils were sometimes known).

I was set free and walking around the yard in less time than it takes to tell it, and now while Lyall is pumping a drink for me we might take a glance at his "chum."

His name was Archibald Lamb, but his brilliant schoolmates chose to designate him as "the bald lamb."

In appearance as well as in name he was lamblike, being pale-faced, mild-eyed and innocent looking, but here the resemblance ended, for he was strong and wiry and was far to the front in all the energetic sports in which the boys engaged. Since Archibald was captain and leader of every game, Lyall was obliged to take second place, but the latter was never envious or resentful, for he was very proud of his chum who was a year older than himself.

On this particular day which I have in mind, I followed Lyall and Archibald to the schoolhouse door, and as they took their places in the second seat I drew back in such a way as to see all that was going on, without myself attracting any notice.

I am not sure that I was not biased in the new teacher's favor, but I believe to this hour that she was a very lovely person. I can not tell just how it was but she showed such interest and confidence in us all that we were willing to learn and eager to please.

On this first day of school she went from one desk to another asking in a clear, soft voice the names and ages of her pupils. When she came to Lyall's chum a suppressed tittering could be heard distinctly. A look silenced the hilarious band, and when the room was so still you could hear the buzzing of a belated fly, the teacher said very kindly to Archibald, who was

LOWELL INGRAIN CARPETS

"The all wool kind"

We have been telling you for weeks WHY you ought to insist upon getting a LOWELL INGRAIN the all wool kind—when you buy a carpet. Thousands have taken our advice and are highly pleased.

ISN'T IT TIME FOR YOU TO CONSIDER BUYING

Remember these points: Cover the whole floor—it's warmer, and easier to take care of; can be used on both sides, a great saving. LOWELL INGRAINS are made that way; can be had in newest styles and colors, just like high grade carpets. If it is wound on a hollow stick, it's a genuine LOWELL INGRAIN.

When you buy carpets, ask the local dealer for LOWELL INGRAINS. Look for the hollow stick and run no risk. Don't accept any other.

Manufactured by **BIGELOW CARPET CO.,** New York

California

For a change why not make that visit to California early in the season? You'll enjoy it. Visit Grand Canyon enroute. Stop over and see the Petrified Forest. Ride through the country of fruits and flowers. Attractive and inexpensive variable route tours within the means of almost every one. About one-half the usual rate. Long limit and liberal stop-over privileges. I'll help you plan a trip. Tickets on sale April 25 to May 5, inclusive.

The Santa Fe is the line of fast trains, modern and comfortable chair cars and luxurious Pullmans, Harvey meals, rock-balasted track, block signals.

N. B.—Members of the Mystic Shrine and delegates to National Congress of Mothers, both to be held in Los Angeles between May 7 and 11, should take advantage of this offer Descriptive folder free.

by this time quite rosy in the face, "Write your name, dear, and your age."

He told the youngsters at recess that if it had not been for their mockery he would not have had the distinction of being the first one called "dear" by the new teacher, wherupon they twitted him as the first "dear" and the only "lamb" in the school.

That day dragged on to its close as did many others which followed, and as far as any outward sign revealed, they were all passed in much the same manner. But, in truth, great changes were going on in the young minds, new ideas were born, noble ambitions took root and flourished under the guiding hand of the young school-mistress who was not the "new teacher" any more, but the loved and trusted friend of all the pupils, without even the exception of the proverbial "bad boy."

The Little Ones

On Arbor Day.

"I wonder," said the little nut,
"What I am going to be!"
The sunshine whispered overhead,
"You'd better grow and see!"
He sent two tender leaflets up
Amidst the crowding grass.
"It's stuffy underground!" he cried.
"Please won't you let me pass?"
Then Robbie saw him standing there
And carried him away.
"I've found the dearest thing," said he;
"My tree for Arbor Day!
He'll need a long, long time to grow,
He's very small, you see;
But by the time that I'm a man
He'll make a splendid tree!
Perhaps then I'll be President—
I wonder what I'll be!"
The sunshine whispered low to both,
"You'd better grow and see!"
—Hannah G. Farnald, in *Youth's Companion*.

An Essay on Girls.

WRITTEN BY A GIRL TEN YEARS OLD.

Girls always want to have their own way, and sometimes they tease until they get it, but most of them get a whipping for teasing. Other times little girls have some little toys, and some other little girls come to play with them. They want to have all the toys themselves. Girls always want to play and when their mothers want them to come and wash the dishes or dry them or take the baby, they say "just in a minute," and when the minute is up, they say "just in a minute," till their mothers have to make them come. When mamma wants her girl to come and take the baby till she puts the bread in the oven and hunts the eggs, the little girl slips around and puts the baby in her papa's arms and slips out to play. Girls throw snowballs, wash each other's faces with snow and have a good time, but when mammas say "Come and wash your hands and face with soap and water," it's "O, I'm clean enough. I washed my hands and face with snow." But mammas say "The snow is not clean." But little girls say "O, let me go this time. I don't like to wash before every meal, and sometimes wash two or three times extra." But mammas say "That only keeps you clean." But girls say "Let me go dirty one day." But mammas say "What if some one comes and sees your dirty hands and face?" "O, I could run in the room and wash myself, and when I come out I would be clean." Girls have to bring the cows in and sometimes milk them. They have to drive the chickens out of the garden and hoe the tomatoes and all such work. —ETHEL G. CATHCART.

Rooks County.

Marriage Maxims.

Never marry except for love.
Never taunt with a past mistake.
Never allow a request to be repeated.
Never meet without a loving welcome.
Never both be angry at the same time.
Never forget to let self-denial be the daily aim and practice of each.
Never let the sun go down upon any anger or grievance.
Never neglect one another; rather neglect the whole world besides.
Never make a remark at the expense of the other—it is meanness.
Never be "stubborn," but let each strive to yield oftenest to the wishes of the other.
Never part for a day without loving words to think of during absence.
Never find fault unless it is perfectly certain that a fault has been committed, and always speak lovingly.
Never let any fault you have committed go by until you have frankly confessed it and asked forgiveness.
Never forget that the nearest approach to perfect domestic happiness on earth is the cultivation, on both sides, of absolute unselfishness.

FAMOUS WOMEN.

Hannah More.

Roll-call—Quotations from Hannah More.

- I. Her early life.
- II. The philanthropist.
- III. The literary woman.
- IV. Female education.

I. Hannah More's early life embraced a great deal. Before she was thirty she had accomplished more than ordinary people have at fifty or perhaps it would not be extravagant to say seventy-five. She studied Latin when eight years old and before she was eighteen she had attracted attention by her verse. The first thirty years of her life were the most brilliant, but not the most useful. She was talented, beautiful, and brilliant, surrounded by a host of famous and gifted friends.

II. Although she was petted and flattered during her early life she was not spoiled. After she was about forty she almost abandoned fashionable life. She found it frivolous, vain, and even dull. She turned her mind and heart to the poor and the rest of her life was spent for their betterment. She wrote for the poor, raised money for them, instituted schools and churches for them—in short spent her life for them.

III. Hannah More was a writer of verse but her fame rests on her writ-

Death of Floral Lawn Cause, Smothered by Dandelions

The dandelion pest has had its day. For one dollar you can get an instrument that can be used by women and children as well as men that will pull dandelions and other noxious weeds at the rate of one thousand an hour, and leave not a drop of dirt nor a visible tear in the sod. No stooping nor bending and is a pleasure not a task to operate it; delivers automatically the weeds pulled, and your hands are not soiled, nor your back tired, no grinding nor bumping around to do your work. Pull any dandelion or weed when tap root does not exceed 16 inches in length. Send one dollar and we will deliver free at your door.

The Standard Incubator Co. PONCA, NEBRASKA

Ings as a moralist and educator. Her "Search After Happiness" went through six editions before she was thirty. Something about her as a writer with selections from some of her productions will prove very interesting.

IV. Under this subject is a chance for some one to express her views on the education of girls. Shall she be educated so as to be able to support herself or to be best fitted to perform the duties of wife and mother? Shall she be educated for usefulness or for admiration? Hannah More's ideas on this subject would be of interest.

Some New Pictures.

The new French collection recently added to the Traveling Art gallery of the State federation has been in use since February 1, and is by far the most popular, as it is the best understood of all the collections. It contains 78 pictures and in these one can trace the progress of French art from its early Italianism through its different stages—classic, romantic, realistic, etc., down to modern times. There are six pictures by Millet, four by Corot, Bonheur, Breton, Bouguereau, and Dagnan Bouivet, two especially fine ones by Bonnat, Jerome, Meissonier, Schefer, and others.

It is a good idea for clubs wishing to secure collections for study or exhibition purposes to order now for next year, as the routes can be arranged so as to make express charges light when this is done.

Shawnee County Pomona Grange. Shawnee County Pomona Grange was called to order at Berryton Hall at 2 p. m. by Worthy Master Sims. The following newly elected officers were then installed: Master, H. H. Wallace; overseer, W. L. Staples; lecturer, O. F. Whitney; secretary, L. Mabel Waters.

Dr. N. J. Taylor offered the following resolution: "That in our township affairs party politics be ignored." A motion was then carried, that this grange recommend the elimination of party caucuses. Brother Whitney introduced the subject of the Boys' Corn-Growing Contest and the prizes that have been offered. He also asked that a representative of each grange state at the next Pomona grange meeting what is most needed in legislation.

The secretary was then instructed to find out the number of members wishing to take the fifth degree.

On motion an organization committee consisting of one from each grange was appointed as follows: Brothers, J. S. Longshore, Lund, Firestone, Polion, Boyles, Brobst.

The Worthy Master stated that the next meeting will be held on the first Tuesday in June, at Indian Creek.

L. MABEL WATERS, Secretary.

Passengers east from Chicago to Fort Wayne, Findlay, Fostoria, Cleveland, Erie, Buffalo, New York City, Boston, and all points east, will consult their interests and find advantage in selecting the Nickel Plate road east from Chicago. Rates always the lowest, and no excess fares are charged on any train, for any part of the journey. Modern dining-car service, with individual club meals, ranging in price from 35 cents to One Dollar, also meals à la carte. Ask for tickets via the Nickel Plate road. Chicago depot, La Salle and Van Buren Streets, the only station in Chicago on the Elevated Loop. Chicago City Ticket Office, 111 Adams Street. Detailed information may be secured by addressing John Y. Calahan, General Agent, No. 113 Adams St., Room 298, Chicago.

WORKING WOMEN

Their Hard Struggle Made Easier—Interesting Statements by a Young Lady in Boston and One in Nashville, Tenn.

All women work; some in their homes, some in church, and some in the whirl of society. And in stores, mills and shops tens of thousands are on the never-ceasing treadmill, earning their daily bread.

All are subject to the same physical laws; all suffer alike from the same physical disturbance, and the nature of their duties, in many cases, quickly drift them into the horrors of all kinds of female complaints, tumors, ulceration, falling and displacements or perhaps irregularity or suppression, causing backache, nervousness, irritability and lassitude.

They especially require an invigorating, sustaining medicine which will strengthen the female organism and enable them to bear easily the fatigues of the day, to sleep well at night, and to rise refreshed and cheerful.

How distressing to see a woman struggling to earn a livelihood or perform her household duties when her back and head are aching, she is so tired she can hardly drag about or stand up, and every movement causes pain, the origin of which is due to some derangement of the female organism.

Miss F. Orser, of 14 Warrenton Street, Boston, tells women how to avoid such suffering; she writes:

Dear Mrs. Pinkham:

"I suffered misery for several years with female irregularities. My back ached; I had bearing-down pains, and frequent headaches;

Lydia E. Pinkham's Vegetable Compound Succeeds Where Others Fall.

I could not sleep and could hardly drag around. I consulted two physicians without relief, and as a last resort, I tried Lydia E. Pinkham's Vegetable Compound, and to my surprise, every ache and pain left me. I gained ten pounds and am in perfect health."

Miss Pearl Ackers, of 327 North Summer Street, Nashville, Tenn., writes:

Dear Mrs. Pinkham:

"I suffered with painful periods, severe backache, bearing-down pains, pains across the abdomen; was very nervous and irritable, and my trouble grew worse every month.

"My physician failed to help me and I decided to try Lydia E. Pinkham's Vegetable Compound. I soon found it was doing me good. All my pains and aches disappeared, and I no longer fear my monthly periods."

Lydia E. Pinkham's Vegetable Compound is the unfailing cure for all these troubles. It strengthens the proper muscles, and displacement with all its horrors will no more crush you.

Backache, dizziness, fainting, bearing-down pains, disordered stomach, moodiness, dislike of friends and society—all symptoms of the one cause—will be quickly dispelled, and it will make you strong and well.

You can tell the story of your sufferings to a woman, and receive helpful advice free of cost. Address Mrs. Pinkham, Lynn, Mass. The present Mrs. Pinkham is the daughter-in-law of Lydia E. Pinkham and for twenty-five years she has, under her direction and since her decease, been advising sick women free of charge.

Miscellany

Coburn on Crop Prospects.

On last Saturday the Kansas State Board of Agriculture issued a report based on a careful canvass of the growing winter wheat situation in practically every neighborhood, as returned by the wheat-growers themselves after critical examination of their fields on Wednesday, April 18.

Last year's winter wheat area was 5,835,237 acres; in December the growers reported the sowing for this year's crop as probably somewhat larger, and approximating 5,900,000 acres. Of this it is now reported that nearly 10 per cent has been plowed up or its wheat estimated as of no value. The condition of the remainder averages for the State 89.5 per cent, as against the State's averages of 95.4 in 1905; 83.5 in 1904; 97.8 in 1903; and 74 in 1902, at about the same dates. Last December the general average for the State's growing wheat was 80.4. This remaining 5,810,000 acres itself constitutes a mighty field of wheat, and the general recent rains closely following previous snows are strongly encouraging to its vigor and development.

Responding to the query "Are present soil conditions favorable for vigorous growth?" the replies for every county are almost without a single exception "Yes!" The wheat is uniformly backward and small for the time of year, but in the main of good color and thrifty. Seventeen counties report average conditions of 100 or better, and 47 report conditions ranging between 90 and 100, which makes 64 counties with conditions of 90 or above. Twenty-eight have a range between 80 and 90. The highest reported for any one county is 107 in Harper, and the better prospects are invariably found in the eastern half of the State; 23 of the 33 counties in the eastern quarter report not an acre to be plowed up. No injury from insects is suggested by even one reporter. Considerable areas in some of the more prominent wheat-producing counties have been plowed up or abandoned, due principally to lack of seasonable moisture and to winds blowing the soil from the wheat's roots. Notably does this apply to a block of the State's area 80 miles in width, measuring westward from the northeastern corner of Phillips County and extending southward 100 miles from the same point, embracing the 12 counties of Phillips, Norton, Decatur, Sheridan, Graham, Rooks, Ellis, Trego, Gove, Lane, Ness, and Rush. Localities here and there in other counties were similarly affected, especially in Hodgeman, Osborne, and Stafford, and in lesser degree in Russell, Lincoln, Saline, Ellsworth, Barton, Rice, Edwards, and Pawnee. The area of wheat in the counties named aggregated 2,413,464 acres, or over 40 per cent of the total area sown last fall for the State, and of this 20 per cent has been abandoned or plowed up. In the majority of these counties the general circumstances last fall were not propitious for sowing, germination, and growth, and this situation, with later unfavorable developments, was not materially improved this spring until too late. While among these are also reported the less encouraging prospects, their growing wheat is rapidly responding to the present excellent conditions of soil and weather, although much is late and small and in many fields of thin stand.

The late, cool, wet spring has delayed all spring work and has retarded, or in many instances discouraged the sowing of oats, and hence a somewhat larger acreage in corn is expected. This is true especially in the main corn-growing counties in the eastern third of the State, and likely much of the plowed-up wheat fields, especially in the block of twelve wheat counties before referred to, will also be devoted to corn.

The table below shows by counties the probable area of winter wheat sown in each last fall, the per cent estimated plowed up, and the per cent of present condition (based on 100) for the remainder:

Counties	Probable acreage	Plowed up mahrage	Condition of	Condition

Clay	62,897	0	96	"slurry" which, when mixed into the proper proportions, is passed into the kiln and heated to a state of insipient fusion so that complete chemical action between the different ingredients may take place. The kilns used nowadays are made of boiler iron and vary from 60 to 135 feet in length. Inside of the boiler iron is a lining about 12 inches thick composed of a peculiar kind of fire clay. The kilns are placed in an almost horizontal position and give a rotary motion which helps the material fed in at one end gradually to work through the kiln and out the other end. For this reason the kilns are often called "rotaries."

Portland Cement in Kansas.

BY PROF. ERASMUS HAWORTH, KANSAS STATE UNIVERSITY.

The first Portland cement plant in Kansas was built at Iola by the Iola Portland Cement Company and began operations in 1900; the second one was built at Iola by the Kansas Portland Cement Company and began operations in 1904; the third was built at Neodesha by the Indian Portland Cement Company and began operations in 1905; the fourth was built at Independence by the Western States Portland Cement Company and also began operations in 1905; the fifth one is now building at Table Mound, a few miles northwest of Independence, and will be owned by the Kansas Portland Cement Company. The first two plants have had their capacity enlarged since first built, which corresponds to building new plants. When the Table Mound plant is completed, the total capacity of the five plants will aggregate about 13 thousand barrels per day.

Portland cement is essentially a silicate and aluminate of lime, although small quantities of iron and other elements are always present. It is made from limestone and shale. In speaking of these materials as found in Southeast Kansas one might say that Portland cement is made of ordinary limestone and shale. This is not true in general. Limestone frequently carries so much magnesium carbonate that it would be worthless for cement production and shale generally carries so much magnesia that it likewise would be worthless. But Kansas is particularly well favored by having these materials in large quantities which do not carry undesirable impurities.

The general processes of manufacture are comparatively simple and easily understood, but there are many details that must be regarded which make the manufacturing process comparatively delicate and difficult. After the materials are quarried they are crushed, dried, and then reduced to a very fine powder technically called

clinker. After cooling it is passed to a new set of grinding machinery and the process of grinding and pulverizing is repeated practically the same as the first grinding of the raw material. From here it goes to the storage bin and is shipped to market, the commercial unit being the barrel consisting of 330 pounds. Years ago the material was actually put into wooden barrels, but a cotton bag long ago drove the barrel out of the market, although the name is still retained.

The great value of Portland cement depends upon the property Portland cement has of hardening or setting when mixed with water even though it may be entirely submerged. It is not soluble to any considerable extent, but takes up water and thereby hardens in a manner very similar to the hardening of plaster of Paris. A mortar made of Portland cement may be used underground or under water, or in any kind of masonry for brick or stone. When thoroughly hardened it makes practically a solid mass or monolith of the entire masonry.

In Southeast Kansas where natural gas is so abundant and cheap, Nature also provided a great abundance of the best of limestone and shale for making Portland cement. Coal or other fuels may be used, but gas is as good or better. In general a ton of coal will manufacture about ten barrels of cement, the actual amount varying at different mills. With gas at three cents a thousand cubic feet we have an equivalent of coal at from 50 to 60 cents a ton. In localities where coal would cost \$2 a ton, this would be a saving of from 14 to 15 cents a barrel, an amount sufficiently great to pay freight on shipping the cement a long distance. Kansas gas-burned cement is now shipped as far north as Iowa and Minnesota, as far east as the Mississippi, and south and west to the Gulf and the Pacific Ocean.

A Correction and Explanation Concerning Parasites.

EDITOR KANSAS FARMER:—Please make a correction to an error in the printing of my article entitled "An Important Enemy of the Hessian Fly and Other Parasites," which appeared in your paper of April 12. The sentence which is printed wrong reads as follows: "With the hymenopterous parasites, the female selects her victim usually when she is in the larval or worm stage, etc." This gives an entirely wrong sense and involves a point that I endeavored to make especially clear. If my manuscript had been followed accurately, the reading would have been thus: "With the hymenopterous parasites, the female selects her victims usually when they are in the larval or worm stage, etc."

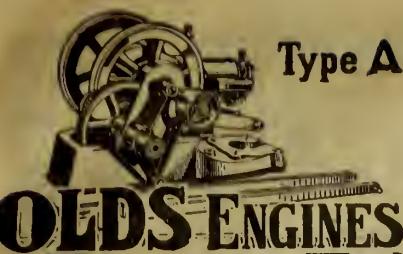

For further explanation, I might mention that the female parasite (she would be in the adult or winged form to become a parent), does not harm her victims beyond laying her eggs on them. Then her mission in life is fulfilled and both males and females perish shortly after the mating period. The young parasites which issue from the eggs in the form of grubs are the creatures which feed on the host. Only during the time they remain as grubs, otherwise called the larval stage, are these parasites effective. Then they subsist within the body of some caterpillar, or grub, or maggot, sometimes inside the egg, cocoon, or pupa of another insect, and also in soft-bodied adults like the plant-louse. The parasitic grub becomes full grown by the time its host dies and then it transforms into a fly ordinarily possessing four wings, which is the adult or parent stage. Thus the adult completes the life history after laying eggs to start another generation.

The fact is not always understood that most insects begin life as worm-like creatures without the least resemblance to the parent form. Their transformations or metamorphoses are wonderful processes of nature. Many complex features attend the lives of insects, and the student is repeatedly

confronted with mysteries which often grow deeper as investigation progresses.

Other kinds of insect parasites with internal habits similar to the hymenopterous enemies are found among the two-winged flies which belong to the order Diptera. They attack many different animals besides insects and, in some cases, are harmful to live stock. Here again we find not the adults but their larvae—which are called maggots in respect to flies—as the active parasitic agents.

Insect parasites which live externally on their host are generally degraded wingless forms, for the adults are as dependent as their young. The ordinary lice are common examples. Such names as lice, ticks, and mites are, however, much confounded in meaning, being also applied to parasites that are not true insects, since the ticks and mites are mainly classed with the spiders.

Sometimes those insects which attach themselves to plants after the manner of scale-lice or create galls in which they live and thus absorb nourishment during their lives are regarded as parasites also. Hence we find different degrees of parasitism. But when the potato bug is held up as an example, such being recently noticed, the conception of a parasite is rather overdrawn. Parasitism is common among plants as well as animal life. Disastrous plant diseases are produced by fungus parasites and they cause quite as much damage as injurious insects. This subject, however, leads us into questions of practical farming, and, for instruction in these matters, the farmer is referred to the many helpful books which can be obtained at slight cost. One little book which deserves recommendation here on account of its simple and attractive style is called "First Principles of Agriculture." It was written by Professors Goff and Mayne for introduction into rural schools and is published by the American Book Co. Price 80 cents. The company also publish Stoke's "Ten Common Trees" (price 40 cents), and Walker's "Our Birds and Their Nestlings" (price 60 cents).

The publisher of THE KANSAS FARMER will be glad to supply any of these books to reader on receipt of price.

E. S. TUCKER.

The Age of Cement.

Seventy-five per cent of the farms of America are a disgrace to their owners, from the standpoint of neatness and appearance of the buildings and surroundings. Wooden structures in varying stages of collapse; rotting fence posts; inefficient watering troughs, and floors of barns and cellars all speak of decay and temporary use. If these farmers could be awakened to the importance of building for all time instead of for a day, the sum total of prosperity and enjoyment in country life would be immeasurably increased.

It has been suggested that the huge stones used by the ancient Egyptians in the building of the pyramids and other monuments which have endured thousands of years, were not quarried out of solid rock, but were made from some substance resembling our modern cement, formed in molds on the site of their final occupation. Their process may be another of the lost arts, and if so we are but repeating history, for we most certainly are entering upon an era

when cement is bound to constitute our dependence in permanent buildings of all sorts.

The hold which cement as a building material has in the world to-day is as strong and lasting as the material itself. Timber is becoming scarce, and at the present rate of consumption the supply in the United States will not last longer than forty years. A durable and satisfactory successor of wood may be found in Portland cement combined with sharp sand and gravel in the proportions of one part of cement to two of sand and four of gravel or stone for very strong and waterproof work, or one part of cement with two and a half of sand and five of coarser material for ordinary work, and one of cement to three of sand and six of stone or gravel where strength is of minor importance. Mixed for ordinary work a barrel, or 330 pounds of cement (3½ cubic feet), will make about 27 cubic feet of concrete. As the sand fills the spaces between the stones (or gravel) and the cement fills the spaces between the grains of sand, the total quantity of concrete will be but slightly in excess of the original quantity of gravel or broken stone.

Portland cement costs \$1.40 a barrel at the mill, and other materials cost according to the hauling distance. At 80 cents a yard for sand or gravel the cost per cubic foot of concrete is around 8 cents, exclusive of labor.

It is often found that concrete construction is absolutely cheaper than lumber, and possessing the additional advantage of being fireproof and permanent. It is used for gutters in stables, cellar and stable floors, drain tile, silos, sidewalks, fence posts, bridges, houses, barns, watering and feed troughs, ice houses and cisterns. There seems no limit to its usefulness. The simplicity with which it is handled commends it to these unskilled in carpentry. Cement should be mixed with its bulky companions in a dry state and just enough water added to make it pack well. A mold for the form required is then filled and tamped down hard and allowed to set for twenty-four hours, when the mold may be removed; or if made with hinges, as are fence post molds and other small forms, it may be removed within a few minutes. Surfaces are generally finished off with a smooth coating of pure cement. Buildings are made from separate blocks or constructed in a solid wall. One of the latest methods is to build this wall hollow, thus making a frost-proof structure, warm in winter and cool in hot weather.

Of the several kinds of cement, Portland possesses the highest cementing power and an additional virtue of hardening under water. All cement should be kept dry. When properly protected it often improves with age. Crushed stone makes a somewhat stronger concrete than gravel; cinders are frequently used. The mortar may be colored to suit the fancy of the builder, and some very beautiful houses are now made of this material.

The Department of Agriculture has issued a Farmer's Bulletin (No. 235) on "Cement Mortar and Concrete," with special reference to its preparation and use for farm purposes. This bulletin is for the asking, and gives in detail many valuable hints and methods impossible in this space.

Farmers should use nothing but a good grade of cement. It is made by a number of concerns. Do not buy from unknown dealers. Several firms make iron molds for fence posts, tile, building blocks, etc., and these will greatly facilitate construction, being cheaper usually than to have one made by a machinist.—Farmers' Voice, Chicago.

Profitable Dairying.—A practical guide to successful dairy management. By C. L. Peck. Illustrated. 5x7 inches, 200 pages. Cloth. Price 75 cents. Orange Judd Company, New York.

The author of this volume is a well-known, practical dairymen, who has made dairying a marked success and who, in this volume, gives such practical hints on dairying as will enable the reader to improve his methods, better his conditions, and more nearly attain that point in business known as success. The treatment of the entire subject is thoroughly practical in every detail, being principally a description of the methods practiced by the author and which after a lifetime of experience and study he has found most advantageous. Yet the scientific hearing on the subject has not been neglected, as the author has availed himself of all the most recent discoveries and advancements in science, thus making the work authoritative, practically as well as scientifically.

Clovers and How to Grow Them.—By Thomas Shaw. Illustrated. 5x8 inches. 337 pages. Cloth. Net, \$1. Orange Judd Company, 439-441 Lafayette Street, New York, N. Y.

This is the first book published which treats on the growth, cultivation, and treatment of clovers as applicable to all parts of the United States and

Her Majesty's Sewing Cabinet

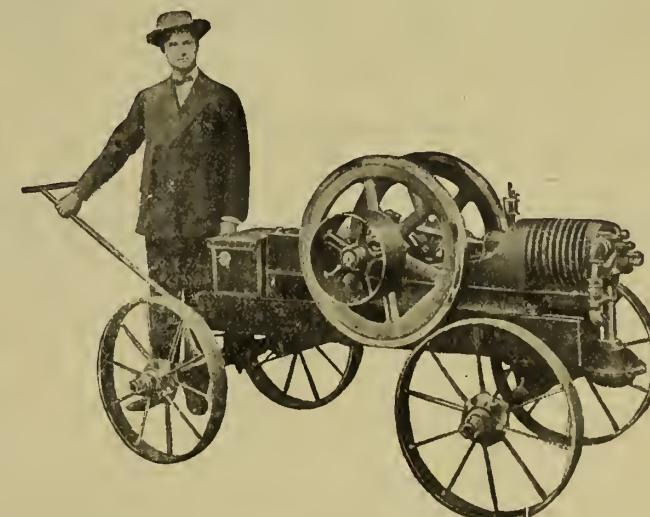

"Enclosed find check for Sewing Cabinet. It is fully up to expectation and my wife is greatly pleased with my purchase." F. M. BUSHNELL
Cashier Richland Savings Bank, Mansfield, O.

We receive such letters daily. There are no disappointments—it pleases them all.

This graceful, handsome piece of furniture is produced by the hands of careful, painstaking craftsmen in our own little workshop. Each Cabinet is completely equipped with everything a woman needs to sew with, and here are fourteen pockets that hold all of her unfinished work—keeps all the sewing together. It's a perfect delight—"makes real pleasure out of real work"—and is just the thing any Kansas Farmer reader will enjoy.

Write for our free descriptive booklet with prices for the different styles, and also please tell us the color scheme of your sewing room that we may suggest a cabinet that will harmonize with its furniture, fittings and decorations. We pay the freight.

ART CRAFT WORKSHOP, 342 Dearborn Street, CHICAGO, ILLINOIS

We wish to call the attention of the readers of KANSAS FARMER to the Waterloo line of gasoline engines. The accompanying cut shows their "Waterloo Boy" hand portable. This is a handy, light portable engine suitable to move from place to place on the farm. Weight of complete outfit only 600 pounds.

The Waterloo Gasoline Engine Company also manufactures a complete line of stationary, pumping, and standard portable gasoline engines. It would pay you well to investigate the Waterloo.

Canada, and which takes up the entire subject in a systematic way and consecutive sequence. The importance of clover in the economy of the farm is so great that an exhaustive work on this subject will, no doubt, be welcomed by students in agriculture, as well as by all who are interested in the tilling of the soil. After thoroughly explaining the principles and practice of successful clover-cultivation in general, the most important species and varieties are discussed in detail. With each are given its varieties, pasturing, harvesting for hay, saving seed, renewing, value as fertilizer. Thus each chapter is complete in itself.

Diseases of Swine.—By Dr. R. A. Craig, Professor of veterinary medicine at the Purdue University. A concise, practical and popular guide to the prevention and treatment of the diseases of swine. Illustrated. 5x7 inches, 200 pages. Cloth. Price 10 cents. Orange Judd Company, New York.

In no other class of farm animals is so little attention given the prevention of diseases as in swine and as a result, the per cent of loss is about twice as great as it is in other species. In discussing the different diseases, the causes and preventive measures are given special attention by the author. The book is conveniently divided into four parts. Part I treats on general diseases, their diagnosis and the methods of administering medicines. With the discussions on each disease are given its causes, symptoms, treatment and means of prevention. The succeeding parts treat on surgical diseases; infectious diseases, and parasitic diseases. Every part of the book impresses the reader with the fact that its writer is thoroughly and practically familiar with all the details upon which he treats. All technical and strictly scientific terms are avoided, so far as possible, thus making the work at once available to the practical stock-raiser, as well as to the teacher and student.

Dairy Interests

Grading Cream.

OSCAR ERF, PROFESSOR OF DAIRY HUSBANDRY,
KANSAS STATE AGRICULTURAL COLLEGE.

The future development of the dairy industry in Kansas depends upon the profits of the dairy business, which is governed entirely by two factors, (1), the cost of production of dairy products; (2), the price received for dairy products. While the first factor plays an important part in the dairy business, it is the second factor that is desired to be considered in this treatise.

The second factor depends entirely upon the demand and supply, and this again depends upon the quality of the article which affects the consumption. To show the significance of this statement, a test was made in which good second-grade butter was supplied on the tables of a series of boarding houses. Without bringing the attention of the boarders to the fact, the butter was changed to fresh butter, classed as first-grade. The consumption was immediately increased approximately thirty-three per cent, and if a still poorer quality than second-grade butter had been furnished, the variation in the amount consumed would have been much greater. Since this paper is to take up only one phase of the dairy industry, namely, the butter side, it is our intention to make clear the great importance of the relation that the quality of the butter bears to its consumption.

Owing to the great progress that has been made in dairying within the past few years, and owing to the fact that it becomes quite necessary to introduce dairy methods in Kansas in order that the fertility of the soil may be maintained, and to establish permanent and prosperous conditions, it was found that the creamery and dairy methods employed in the East were not suited to the conditions in Kansas. Owing to the many localities in Kansas which are sparsely settled, it involved a great expense to transport milk, on account of its bulky nature, to a central point, as is still done in the East. To overcome this objection in these localities and to bring about conditions which permitted the average farmer to sell his cream on an open market, the same as he does grains and other farm products, it became necessary to introduce what is now called the hand-separator system, by which every farmer who purchased one of these cream-separators could skim his milk, feed the skim-milk to farm animals, store his cream for several days, and finally haul the product to the creamery or station to be sold to some creamery where it is ultimately made into butter. These circumstances brought on conditions which were quite unfavorable for the production of first-class butter. These conditions came about in the following manner:

First, on account of the fact that the farmers were not accustomed to operating the hand-separator and keeping it in a perfectly sanitary condition, which is so essential in the art of dairying. Thus at times milk was run through filthy separators which tainted the cream and started a serious fermentation.

Second, since it is the milk-sugar and casein which are the chief constituents of skim-milk that are most fermentable, and since cream consists merely of butter-fat and skim-milk, it would under all conditions be more profitable for the farmer to remove and retain as much as the skim-milk as possible, which would reduce the weight of vol-

ume and thus lessen the transportation expense. But the importance of regulating the cream-separator was not recognized, and a great deal of thin cream was shipped, which made conditions more favorable for the development of taints and bad flavors in cream.

Third, cream produced under these conditions was kept for a long time before it was delivered. On the average Kansas farm very few appliances are at hand to cool the cream, and under ordinary temperatures, such as we would expect to find on a farm, it would not require more than two days to set up a fermentation in the cream which would develop a sourness sufficient to make it ripe enough to churn. Hence, it can be stated without further explanation that cream kept for a week or two becomes overripe, and in a certain sense of the word, decayed.

Fourth, long distances of transportation and the lack of cooling facilities on the train were still more conducive to the furthering of the fermentation. Out of such a product the butter-maker could do little to restore the quality, and to make an extra butter out of this cream would be impossible.

Fifth, with this method of handling cream, fierce competition began. Any cream, no matter how old or how rancid, had a market at the creameries at the same price per pound of butter-fat as that paid for first-grade cream. According to this method the man who was neat and clean in his operations and handled his cream under the most sanitary conditions received the same money as the man who paid no attention to the quality of his cream. Hence, there was a constant tendency for the dairymen of Kansas to produce cream of a poor quality.

Sixth, owing to this unhealthy competition the price of butter-fat was enhanced and the creamerymen were obliged to resort to methods which would tend to increase the overrun of the butter in order that they might have a fair margin of profit. The overrun in short is the difference between the butter-fat and the butter. It consists chiefly of water and salt, with a small amount of casein, milk-sugar, and ash. By increasing the overrun, water was incorporated in the butter, which naturally resulted in reducing the quality of the butter if more than 16 or 18 per cent were incorporated.

THE GRADING OF BUTTER.

The great markets of the United States score butter under the following plan:

Flavor	45
Body	25
Color	15
Salt	10
Package	5

FLAVOR.

The value of butter over grease depends largely upon flavor and aroma. To make a good-flavored butter we must have good milk to begin with. The principal defects in flavor can be classed under four heads:

1. Rancid flavor.
2. Tainted flavor.
3. High acid flavor.
4. Low acid flavor.

The cause of rancidity in fresh butter is due:

1. To old milk or old cream.
2. To unsanitary conditions by using filthy utensils and apparatus.
3. To a poor, loose body containing large quantities of casein, which, when contaminated and kept at a warm temperature for a short time, develops rancid acid very quickly.
- Tainted flavor in butter is caused:
 1. From tainted milk or cream.
 2. From the impure water with which it is washed.
 3. From unclean or badly flavored salt.
 4. By the use of unclean utensils, such as churn, worker, ladle, packing boxes, etc.
5. By storing in places where odors are strong from filth of foreign substances placed around it.

The high acid flavor is due:
To cream being held at too high a temperature for too long a time.

A low acid flavor is due:
To cream being held at too low a temperature for too short a time.
If the flavor of butter is perfect its value as given in the card is 45 points.

BODY.

The body of the butter should have a granular, yellow, amber appearance. The cause for the difference in appearance in texture between butter and grease is due to the amount of water incorporated in butter. There should be approximately 16 per cent of water in butter—not less than 12 per cent, and not more than 17 per cent.

The defects in the body of butter may be divided into six classes:

1. Too much water.
2. Greasy.

DON'T DELAY BUYING —YOUR— CREAM SEPARATOR

Although the cream separator is an all-the-year round machine, right now is the best time to buy one if you have not already done so. Within the next two months the milk flow of most herds will be doubled, and savings will count biggest. If you haven't a separator to take care of this extra milk, a great percentage of your entire year's milk profits will be lost. Any one who has two or more cows should by all means take steps to secure a good separator without delay. If you buy one at once it will more than half pay for itself before the middle of the summer. Otherwise, just so much money will be lost, wasted, thrown away. Why not have a DE LAVAL machine set up at once in your dairy for a free trial, where you may test and try it out. This will cost you absolutely nothing, and you can see and learn for yourself just what the separator will save you. Over 700,000 users have already proven the DE LAVAL to be the most profitable thing on the farm, and the number of DE LAVAL machines sold to date is ten times all others combined. Hence, there is no reasonable excuse why any one who is desirous of securing the largest possible milk profits from their cows should not at least give the DE LAVAL a fair trial. Don't delay, but write us to-day for a free catalogue and full particulars concerning how you may secure a DE LAVAL machine. Those who haven't the ready cash with which to purchase a separator should remember that the cash is not necessary in buying a DE LAVAL, for it can be purchased upon such liberal terms that it will more than save its cost while it is being paid for. Write to-day.

FOUR CENTS MORE FOR NO. 1 CREAM THAN FOR NO. 2

The creameries of the country have become so convinced of the increased value of thick cream over thin cream that many of them are paying a premium on cream containing 30 per cent or more butter fat over that containing under 30 per cent.

One of the largest buyers of cream in the West, the Hanford Produce Co., of Sioux City, Iowa, issued in January the following statement to its cream shippers.

"We are going to offer a premium of **4 cents per pound** butterfat for what we term No. 1 cream.

FIRST GRADE cream shall consist of all hand separator cream which is delivered at least twice a week in winter and three times per week in summer, this cream to be delivered reasonably sweet and testing **30 per cent or more.**

SECOND GRADE cream shall consist of all hand separator cream delivered in good condition not less than once a week or testing **less than 30 per cent.**

Under these conditions creamery patrons should buy only the cream separator that can skim a heavy cream. The

UNITED STATES CREAM SEPARATOR

can skim a heavier cream than any other and do it **without clogging**. The U. S. has the record of skimming a cream testing **65 per cent**. And remember also that the U. S. holds the **World's Record** for clean skimming.

It gets the **most cream** and will deliver **as heavy a cream as you want**.

Write for copy of our fine, new, 1906 separator catalogue. It tells **why** the U. S. can skim the **first grade** cream; how it made the World's Record for clean skimming and many other things you should know before you put any money into a cream separator. Write for a copy today—do it **now** while you think of it. Ask for catalogue No. 400 and we'll send it **quick**.

VERMONT FARM MACHINE CO.,

Bellows Falls, Vt.

We probably have a selling agent in your vicinity, and if so, will give you his name when we send you the catalogue. It is his business to show you a U. S. Separator if you want to see one.

Sharples TUBULAR CREAM SEPARATORS

WHICH DO YOU WANT?

Tubular or Bucket Bowl?
Simple Bowl or Complicated?
Izzers or Hasbeens?
Waist Low Can or Head High Can?
Seli Oilng or Oil Yourself?
Wash 3 Minutes or Wash Thirty?
All the Butter or Most All?
Best Butter or Medium Butter?

Tubulars are different, very different. Just one Tubular—the Sharples. All others make bucket bowls—can't make Tubulars because they are patented. Ask for catalog Q-165.

THE SHARPLES SEPARATOR CO.
WEST CHESTER, PA.
TORONTO, CAN. CHICAGO, ILL.

3. Oily.
4. Tallowy.
5. Cheesy.
6. Milky body.

Too much water is due:

1. To insufficient working.
2. Working butter too cold or too warm.

3. Washing butter with warm wash water when churned at a low temperature.

Creamy butter is due:

1. Butter handled or worked too much.

2. Churned in unwashed or unscalded churn, worked on unscalded workers, and handled with unscalded ladies.

3. Butter worked below fifty degrees assumes a creamy appearance.

4. Butter worked at too high a temperature assumes a similar appearance.

Oily butter is due:

1. Soft, succulent feeds, gluten feeds, or oil-meal.

2. To a specific fermentation.

3. To heating the cream near the boiling point when pasteurizing.

Tallowy butter is due:

1. To improper feeding, for instance, too much cottonseed-meal or bran in proportion to other feed.

2. To a lactic fermentation.

Cheesy butter is due:

1. To the curdling of cream, either sweet or sour.

2. To a milky body.

A milky body is due:

1. Buttermilk not separated from butter, or butter not thoroughly washed.

2. Butter made fromropy cream.

The body of butter if perfect counts 25 points.

COLOR.

The color of butter should be of a light straw color, and the defects in color may be classed as follows:

1. Too yellow.
2. Too light.
3. Mottled.
4. Specked.

5. Streaky and wavy.

Too yellow butter is due:

To the use of too much coloring matter.

Too light is due:

To insufficient coloring matter.

Mottled and streaky is caused:

1. By developing a high acid in cream or starter and the incorporation of the froth of the cream.

2. By improper separation.

3. Change of temperature.

4. Sudden chilling before salt is dissolved.

5. Insufficient working.

6. Uneven distribution of salt.

Specked butter is due:

1. To over-ripe cream.
2. To dried cream.
3. To foreign matter.

Color counts for 15 points.

SALT.

The salting of butter depends largely upon the demands of the market. However, butter may be:

1. Excessively salted.
2. Not salted enough.
3. Gritty.

Gritty salting is due to salt being too hard or not giving salt time enough to dissolve.

Salt counts 10 if perfect.

BUTTER PACKAGE.

Neatness of package has much to do with the increased consumption of butter. Butter, if put up in prints, should be wrapped in parchment paper to preserve it. Prints should be square and have a neat, trim appearance. Whatever may be the condition, the man that puts his butter up in the handsomest packages will sell the most butter if other conditions are equal.

The value of package if perfect counts 5.

Butter, being first scored, is then graded into extras, firsts, seconds, and

thirds. The rules governing the grading of extras is that it shall consist of high-grade butter produced during the season, scoring not less than 93 points. The following are the requirements of extras:

1. Flavor—Must be fine, fresh, and clean if of fresh make, and good, sweet, and clean if held in storage.

2. Body—Must be firm and solid, with a perfect grain or texture, free from saltiness.

3. Color—Must be uniform, neither too light nor too high.

4. Salt—Well dissolved, thoroughly worked in, not too high nor too light.

5. Package—Good and sound, as required in classification.

FIRSTS.

Firsts shall be a grade just below extra, scoring 87 points or higher, lacking somewhat in flavor, which, however, must be good, sweet, and clean. All other requirements are the same as in extras.

SECONDS.

Seconds shall consist of a grade just below firsts, scoring not less than 80 points.

Flavor—Must be fairly good and sweet.

Body—Must be sound and smooth boring.

Color—Fairly good, although it may be somewhat irregular.

Salt—May be irregular, high or light salted.

Package—Same as required in firsts.

THIRDS.

Thirds shall consist of butter below seconds, scoring not less than 75.

Flavor—Reasonably good, may show strong tops and sides.

Body—Not smooth boring.

Color—Mixed or streaked.

Salt—Irrregular.

Package—Miscellaneous.

The Profitable Dairy Cow.

PROF. C. S. PLUMB, OHIO STATE UNIVERSITY.
(Continued from last week.)

JOHN'S TRIP AND THE RESULTS.

One day at the dinner-table, John surprised the family by announcing that he was seriously considering going to the World's Fair. He would enjoy the change, but as he said, "Father, I would like to see the dairy-cattle test and study the cows there a bit. As those animals represent select ones of different breeds from over the country, I should like to examine them and study both type and breed." "Well, if I were you, John," said the elder, "I would not only see those cattle, but would stop at Syracuse and Rochester and see those two herds at Firth and Bogswell. We have read a deal of them and of the remarkable records some of their cows have made, and it might pay you to stop en route and see them. You might pick up some ideas on breeding and management."

This accounts for John going away on a vacation in July after the haying was finished, a thing he had never been guilty of before. He felt kind of guilty as he was driven to the station, all dressed up in his Sunday best, for he knew the folks would have to do his chores. But he believed it would pay. He did not realize then, like many another good brother, that travel is a great education in itself. He learned that later. As he sped across country in the rapidly moving train, through fertile valleys, over rich bottoms and along by rolling uplands, he saw many herds of cattle, kept mainly for milk-production. He was greatly impressed with their variation and their apparent inferiority, even when seen from the cars. It was a revelation to him. In later years, when travelling through the green pastures of England and Scotland, among the many uniform herds there, his mind harked back to that trip across American soil on that warm July day. The contrast was striking, and he felt full sure that it was educational in its effect. If some of his fellow countrymen could have seen these sights as he did, he was sure they would have taken the lesson well to heart.

The exposition reached, the cows soon came in for examination. They represented both dairy and general-purpose type, but it impressed him that from the point of dairy value, the closer the cows adhered to dairy type, the better they ranked in production. There were exceptions, but the average of a class was what he judged by. From the profit point of view, he saw more money in the udder of capacity than he did in the thick buttocks and meaty back and breast. The working dairy records were also demonstrating that one class gave better returns than another. He was particularly impressed with several individuals, not

the best in type, but with large capacity, who were giving the highest yields. This was a new idea to him, and he was particularly interested in the fact that the cows with the largest capacity were not necessarily the best in type. This was a new idea to him, and he was particularly interested in the fact that the cows with the largest capacity were not necessarily the best in type. This was a new idea to him, and he was particularly interested in the fact that the cows with the largest capacity were not necessarily the best in type.

Get the Cream

GET IT ALL, GET THE LAST DROP. BUY DIRECT FROM THE FACTORY AT FACTORY PRICES AND SAVE 20% to 50%

It's to your interest to know about the liberal selling plan of the

Davis
Cream Separator

No other skimming device known so surely gives you all the cream, and none does it with so little work. It is absolutely the simplest and easiest running separator. Only 8 pieces in its bowl. Think of the ease of keeping such a bowl clean. It never can get out of balance. The tank is only bolt high, no high lift. You should know all about the Davis. Investigate before you buy. Write to-day for money saving catalog No. 128.

DAVIS CREAM SEPARATOR CO.,
54 North Clinton St., Chicago, Illinois.

THE KANSAS FARMER

YOU CAN'T AFFORD TO MAKE A MISTAKE.

Don't buy a cream separator that makes more work. Many of them do, but you need not get one of that kind. Investigate. You can try an

OMEGA Cream Separator

before you buy it. If you do not find that it is more easily turned; more durable than any other, we will not even ask you to keep it. You can thoroughly wash it in 3 or 4 minutes—long before the bowls of other separators are "run down." It drains itself. It does not whip the cream nor break the butter fat globules. It requires no special tools for its care. It is the real labor-saving separator. You really ought to investi-

gates it.

Is this fair?

If you keep milk cows we will set up an Omega separator on your place, and let you try it. If you don't find that it turns more easily, is more quickly and easily washed, gives less trouble, gets all the cream, and of a finer quality than any other—you need not keep the Omega, and the trial will cost you nothing. Will it not pay you to investigate?

Send us your name and address. "More Milk Money" tells how to care for cows; how to make butter; how to select good cows; how to wash butter; how to avoid "white specks," and a hundred other things you ought to know. FREE if you tell how many cows you keep, give address of a neighbor who keeps cows, and mention this paper. Ask also for catalog.

Cleveland Cream Separator

Direct to You
30 Days Approval Test

Easy Running:—In the Cleveland Separator this isn't an empty claim. The whole thing is summed up in an honest, easy to prove reason. The Cleveland is the only ball-bearing separator made.

Easy Cleaning:—The Cleveland has fewest parts and skinning device is made of aluminum. Investigate. You will find this metal is non-corrosive, non-poisonous, milk cannot stick to it and there is no coating to wear off. We prove these things.

Long Life:—The Cleveland has the fewest parts of any separator made and gets along at the slowest speed. Parts can't wear out that are not there. The Cleveland is a guaranteed perfect Skinner.

How We Sell:—To you from our own factory. The only manufacturers making a high grade separator and selling it at a fair, square price and a fair, square plan. No money in advance. No note to sign. No fuss of any kind. The catalog tells you. Write for it.

Send your orders quick.

A Reward FOR THE Man Who Milks

The man who ships his cream direct is rewarded for quality. He stands alone. He doesn't have to bear the burdens and suffer for the mistakes and carelessness of his neighbors. If your cream is clean and not too sour and good flavor, you get the highest grade and the best price. If your facilities for handling your cream are better than your neighbor's and you can keep it longer you need not ship so often. Consequently you economize on time.—"Time is money."

Everything favors the individual shipper.

Our system takes care of him. Our factory is his natural home.

Send us your cream and we'll send you the money.

Respectfully,

**BLUE VALLEY CREAMERY CO.,
ST. JOSEPH, MISSOURI.**

Peerless Cream Separators

Reasons Why the PEERLESS is the Best

1st—Twice the capacity of any other bowl. That is to say two times smaller than any other bowl of equal capacity.

2d—Compound feature, two bowls in one, hollow bowl, and disk bowl, combining all the features of the tubular and disk machines.

3d—Enclosed frame, free from dust. Injury resulting from machine impossible.

4th—Perfectly noiseless.

5th—Heavy enough and strong enough to lift a box car, which insures durability.

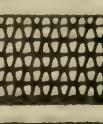

6th—The bushings made of phosphor bronze—the most serviceable material for the purpose. Fitted and guaranteed to be accurate to $\frac{1}{2}$ of 1,000 of an inch.

7th—Every journal bushed with brass or phosphor bronze. This fact together with the fine adjustment described above, accounts for the tight draft of the Peerless machine. Each bushing is made in duplicate and interchangeable and if at any time they show wear they can be replaced at small cost.

8th—At normal temperature the skimmed milk will always show less than 5-100 of 1 per cent of butter fat and generally less than 1-100 of 1 per cent butter fat. PEERLESS CREAM SEPARATORS are guaranteed to anybody—everybody, anywhere—everywhere.

Agency - 313 Broadway, New York

How Is Your Heart?

Is your pulse weak, too slow, too fast, or does it skip a beat?

Do you have shortness of breath, weak or hungry spells, fainting, smothering or choking spells, palpitation, fluttering, pains around the heart, in side and shoulder; or hurt when lying on left side?

If you have any of these symptoms your heart is weak or diseased, and cannot get better without assistance.

Dr. Miles' Heart Cure strengthens weak hearts, and rarely ever fails to cure heart disease. Try it, and see how quickly you will find relief.

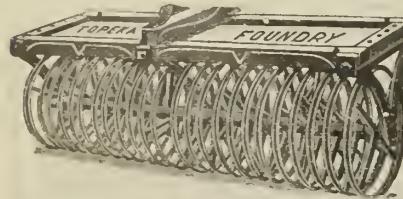

"About January 1st, 1902, I took down with weakness and dropsy, and gradually grew worse. I was told by my family physician that my case was hopeless. My neighbors and family had given me up to die. My limbs and body were swollen to one-third larger than normal size, and water had collected around my heart. For at least three months I had to sit propped up in bed to keep from smothering. I sent for five bottles of Dr. Miles' Heart Cure, and by the time I had taken them all I was entirely cured. I feel better than I have for twenty years, and I am able to do any kind of work on my farm. My attending physician told me that if it hadn't been for Dr. Miles' Heart Cure I would now be in my grave."

L. T. CURD, Wilmore, Ky.

Dr. Miles' Heart Cure is sold by your druggist, who will guarantee that the first bottle will benefit. If it fails he will refund your money.
